Dr. Paromita Chakraborty Convener- RASTH-2021(ESNT) Associate Professor Department of civil engineering, Leading environmental science and Technology lab in SRM research institute, SRMIST

Convener Message

It is an honour to convene the three-day International Conference on "Recent Advances in Applied Sciences, Technology & Health" (RASTH-2021). The motivation for such an event arises with the global concern for environmental preservation in terms of natural resources and increasing focus on environmental pollution prevention and conservative strategy for a sustainable future. As an academician, one would realise that addressing the knowledge gap for solving these problems is never a one man's job. RASTH brings together a diverse range of personalities such as international experts including scientists, professors, policy makers, non-governmental organizations, industry experts, public health professionals and young researchers under one roof to assimilate varied facets of one common problem. The theme "Environmental Science and Technology" emphasises on core areas including Air, Soil and Water Pollution, Atmospheric Transport Modelling and Satellite Imagery, Remediation Techniques, Policy, Legislature and Governance, Water Resources and Management, Waste Management, Remote Sensing and GIS Applications, Biodiversity and Climate Change and Environmental Monitoring and Engineering. This international conference is purely aimed at knowledge sharing and academic interaction to improve clarity within the scientific community that is ardently working towards finding solutions for these issues. I convey my sincere thanks to the management of SRMIST for funding the event, realising its relevance and importance. I also extend my heartfelt wishes to the organising committee for coming together and organising this event at such a magnificient scale.

EFFECT OF SUSTAINABLE ENERGY SOURCES FOR LFC OF SINGLE AREA MULTI SOURCE POWER SYSTEM

D.Boopathi¹, S.Saravanan², K.Jagatheesan³, V.Kumarakrishnan⁴, G.Vijayakumar⁵

^{1,3,4} Paavai Engineering College, Namakkal, Tamilnadu, India ^{2,5} Muthayammal Engineering College, Rasipuram, Namakkal, Tamilnadu, India

Abstract

In this article Load frequency control (LFC) scheme has been involved to control the frequency oscillation in single area electric power system consists of suitable energy (wind) source with fuel cell and battery energy sources during emergency situation. To perform the LFC, a Proportional – integral – derivative (PID) controller has implemented as secondary controller. Particle - swarm – optimization (PSO) technique is also involved in this article to acquire optimal controller gain parameters of the PID controller. The trial and error (conventional) method based integral (I), proportional integral (PI), and proportional – integral – derivative (PID) controllers result were compared to find the superior controller to maintain the system output quality. The proposed PSO technique optimized PID controller performance is compared with conventional method based PID controller results. The suggested optimization technique based controller performers better than conventional method based controller performers like settling time, peak over and under shoot.

Key word: Particle – Swarm – Optimization, PID controller, Frequency stabilization, frequency deviation, Load frequency control.

PSO Optimum Design-PID Controller for Frequency Management of Single Area Multi-Source Power Generating System

Abstract

In this article, Particle Swarm Optimization (PSO) tuned Proportional-Integral-Derived (PID) controller is proposed for frequency management of a single area multisource power generation unit. The power system comprises of both renewable and non-renewable energy sources which includes thermal, solar and wind power generating units. In this work, Integral (I), Proportional -Integral (PI), and PID controllers are utilized as a subsidiary controller to regulate frequency deviation of the power system during unexpected load variation. The gain values of the controller are tuned by applying conventional (trial and error) scheme and PSO technique. Conventional method tuned Controller tuned using conventional method shows that PID controller provides superior response over I and PI controller response. Subsequently, PSO is implemented to tune PID controller gain values. To demonstrate the superiority of the PSO-PID controller, the output response is compared to the conventional tuned PID controller result. It is obvious from the comparison, the PSO-PID controller is provides fast settling time with minimal frequency overshoot and undershoot at various loading conditions.

Abstract

Ant colony optimization technique (ACO) is proposed for frequency regulation of single area power generating network. The proposed system consists of thermal power generating system with reheater, turbine, governor, hydrogen aqua electrolyzer (HAE), and fuel cell (FC). Proportional–integral–derivative (PID) regulator acts as an auxiliary regulator to maintain the frequency deviation during unexpected load demand. The proposed PID controller gain values are tuned by utilizing ACO tuned PID regulator with ITAE objective function. To show the superiority of the ACO technique and the performance, responses were equated with conventional method PID controller's results for the identical power network. The dynamic performance of the suggested ACO-PID regulator gives improved response over conventional PID in terms of quick settling time.

Part of the <u>Lecture Notes in Mechanical Engineering</u> book series (LNME)

Abstract

The continuous rise in the price of energy and the materials has necessitated industries to gear-up their efforts in modifying the heat exchangers for higher outputs. The proposed work on heat exchanger considers technical aspects such as heat transfer modes, pressure-drops, long-lasting performance along with economic aspects. The compactness in size and minimizing energy requirement is significant in the design of tubes for improved heat transfer. In heat exchanging devices, the heat transfer rate could be enhanced by generating disturbance in the fluid flow thereby breaking the thermal boundary layers that hinder effective heat exchange. But such a process would require increased pumping power. Hence, this work attempts to achieve improved heat transfer rate in a double pipe heat exchanger (DPHE) of counter-flow type that consumes economical pumping power and involves a technique in which inserts of varied profiles are used to disrupt the flow in the tube. The different types of insert profiles used include Plain Tape (PT), Plain Tape Step-Cut Arc (PT-SCA), and Plain Twisted Tape Step-Cut Arc (PTT-SCA) to study their performance in heat exchange rate. The effect of an insert is that the heat transfer surface gets enlarged for convection and creation of turbulence in the fluid flow, both contribute for increased heat transfer. PTT-SCA insert provided the higher thermal enhancement for DPHE.
