ORGANIZING COMMITTEE

Chief Patrons

Shri. CA. N. V. Natarajan

Chairman,

Paavai Educational Institutions.

Smt. Mangai Natarajan

Correspondent,

Paavai Educational Institutions.

Patrons

Dr. K. K. Ramasamy

Director-Administration,

Paavai Educational Institutions.

Dr. M. Premkumar

Principal,

Paavai Engineering College.

Convenors

Dr. T. Arunkumar

HoD/BME,

Paavai Engineering College.

Dr. D. Banumathy

HoD/CSE,

Paavai Engineering College.

Advisory Committee

Dr. K. Selvi

Dean Academics,

Paavai Engineering College.

Dr. I. Rajendran

Dean R&I,

Paavai Engineering College.

Dr. B. Murali Babu

COE,

Paavai Engineering College.

Dr. Raji Sundararajan

Professor, ECET

Purdue University, W. Lafayette, Indiana.

Dr. Sundaram Gunasekaran

Professor,

Agricultural Engineering Laboratory.

Dr. V. Ganapathy

Eminent Professor

Chennai.

Prof. U. Chandrasekhar

FIE, C.Eng.,

CEO-GM Scientific Innovation & Research Centre & Adjunct Faculty

CPDM IISc.

Mrs. S. Vijayanthi

Senior Director,

UPS Technology Centre, Chennai.

Mr. Jayakrishnan Appusamy

Senior Director - AI & Analytics,

Cognizant Technology Solutions, Coimbatore.

CO-ORGANIZING COMMITTEE

Dr. A. Vivekanandhini

Professor and Head
Department of Agriculture Engineering.

Ms. K. Preethi

Assistant Professor
Department of Agriculture Engineering.

Dr. R. Arravind

Professor and Head
Department of Aeronautical Engineering.

Mr. P. Prasanna

Assistant Professor
Department of Aeronautical Engineering.

Dr. P. Srinivasan

Professor and Head
Department of Artificial Intelligence and Machine Learning.

A. Rathipriya

Assistant Professor
Department of Artificial Intelligence and Machine Learning.

Dr. Raja

Professor and Head
Department of Artificial Intelligence & Data Science.

Dr. T. Arunkumar

Professor and Head
Department of Biomedical Engineering.

Dr. N. Jayanthi

Associate Professor
Department of Biomedical Engineering.

Ms. V. Ramya

Assistant Professor
Department of Biomedical engineering

Dr. Nirmala

Professor and Head
Department of Bio Technology

Dr. A. Murugesan

Professor and Head
Department of Chemical Engineering

Ms. G. Swathi

Assistant Professor
Department of Chemical Engineering

Prof. Mrs. K. Sharmiladevi

Professor and Head
Department of Civil Engineering

Mrs. S. Rajeswari

Assistant Professor
Department of Civil Engineering

Dr. D. Banumathi

Professor and Head
Department of Computer Science Engineering

Dr. P. Thiyagarajan

Associate Professor
Department of Computer Science Engineering

Mr. V. Maheskumar

Assistant Professor
Department of Computer Science Engineering

Dr. M. Rameshkumar

Professor and Head
Department of CSE (IOT)

Dr. P. Muthusamy

Professor and Head
Department of Cyber Security

Mrs. J. Velumani,
Associate Professor
Department of Cyber Security

Dr. R. Mohanapriya
Professor and Head
Department of Electronics and Communication Engineering

Mr. S Vijay Murugan
Associate Professor
Department of Electronics and Communication Engineering

Dr. V. Annapoorani,
Associate Professor
Department of MCA

Dr. G. Balaji,
Professor and Head
Department of Electrical and Electronics Engineering

Dr. S. Thirunavukkarasu
Associate Professor
Department of Electrical and Electronics Engineering

Dr. S. Kailash
Professor and Head
Department of Food Technology

Ms. S. Anita
Assistant Professor
Department of Food Technology

Dr. B. Venkatesan
Professor and Head
Department of Information Technology

Mrs. M. Pushpalatha
Associate Professor
Department of Information Technology

Dr. A. P. Sivasubramaniam

Professor and Head
Department of Mechanical Engineering

Mr. R. Meiyazhagan

Assistant Professor
Department of Mechanical Engineering

Dr. D. R. P. Rajarathnam

Professor and Head
Department of Mechatronics Engineering

Mr. R. Arunbabu

Assistant Professor
Department of Mechatronics Engineering

A. Velsamy

Professor and Head
Department of MBA

Ms. A. Sheela

Assistant Professor
Department of MBA

Dr. C. PraveenKumar

Professor and Head
Department of Pharmaceutical Technology

Ms. S. Pragathi

Assistant Professor
Department of Pharmaceutical Technology

CHAIRMAN'S MESSAGE

Shri. N.V. Natarajan, B.Com., F.C.A.,
Chairman, Paavai Institutions

It is true that India shines in various fields such as technology, manufacturing, agriculture, education, space research, economic stability and renewable energy. But still, in the social set-up of our nation, a vast gap between the rich and the poor as well as the educated and the uneducated remains quite evident and it becomes the prime duty of the engineers of Gen-Y to narrow down the gap to raise our nation to the next level. At this juncture, let us remember and follow the views of our honourable Prime Minister Mr. Modi such as 'Swachh Bharat', 'Make in India', 'Digital India', 'Startup India' and 'Cashless Economy'.

I believe that the International Conference 'ICATS-2024' would definitely look into the current trends and find solutions to the existing issues by developing the modern science and technology. Since inter-disciplinary research is very much essential for the sustainable growth of the recent adaptive technology, one can easily understand and appreciate the immediate relevance of a conference like this.

I am really happy to see that Paavai Engineering College is offering an opportunity through ICATS – 2024 for the students, scholars, researchers, professionals and industrialists from various institutions and organizations to share their knowledge, skills, experience and expertise on a common platform.

I am confident that the conference would surely focus on the talent of the learning community and also the emerging technologies would make a breakthrough in the acute and cut-throat competitions among the nations in the world.

I wish the conference 'ICATS – 2024' a grand success.

DIRECTOR – ADMINISTRATION'S MESSAGE

Dr. K.K. RAMASAMY
Director – Administration,
Paavai Institutions

I am immensely pleased to see that Paavai Engineering College is organizing an International Conference 'ICATS – 2024' on "Adaptive Technologies for Sustainable Growth". The very purpose of any conference is to facilitate the students, scholars, researchers, professionals and subject experts to meet under one umbrella to discuss and share the technological skills and knowledge.

Updation of scientific temper and knowledge has become a dire necessity in the current scenario. Research plays a seminal role in the field of higher education since every student is expected to be trendy in his area of knowledge.

I believe that the objective of this conference would be fully realized and achieved by positive and productive exchange of ideas in the recent developments of science and technology.

I wholeheartedly congratulate the staff, the students and those who have involved themselves in organizing and conducting this conference.

Wishing the conference ICATS-2024 a great success.

PAAVAI ENGINEERING COLLEGE

PRINCIPAL'S MESSAGE

Dr. M. PREM KUMAR
Principal

The word 'engineering' basically means the effective transformation of mathematics and science concepts to useful systems which are beneficial to the society. Apart from the classroom teaching, programmes like National and International Conferences, Symposiums and Seminars are organized in higher education institutions with the sole purpose of exchanging or sharing the views and knowledge of a good number of delegates, scholars, subject experts, etc. from different organizations and institutions.

The staff and the students should present their ideas and leverage the opportunities provided and look at the engineering and scientific concepts in the right perspective. Out-of-the box thinking is very much crucial for knowledge Updation and to be trendy. It is an opportunity for amalgamating their ideas, blending together their thoughts and to upgrade their knowledge and performance. I hope that the conference would serve the purpose for which it is organized.

I wish 'ICATS- 2024', from the bottom of my heart, a grand success.

PAAVAI ENGINEERING COLLEGE

ABOUT THE INSTITUTION

PAAVAI ENGINEERING COLLEGE

Paavai Engineering College started in the year 2001, offering UG programmes and PG programmes has been approved by AICTE, NAAC and accredited by NBA. The college is securing top ranks consistently among the leading engineering colleges in Coimbatore region. The departments of Engineering and Management Studies are recognized as approved research Centre's by Anna University Chennai to offer Ph.D. programmes. It has obtained research grants from AICTE, TNSCST and other funding agencies. The college has been organizing Seminars, Workshops, FDP and Conferences periodically in the state-of-the-art technologies. The institution has signed MoUs with leading MNCs like Infosys, Microsoft, Wipro and also Spoken Tutorial of IIT Bombay resource Centre.

PAAVAI ENGINEERING COLLEGE

ABOUT THE ICATS

ICATS'2024 will be a mélange of eminent speakers, Academicians, Subject experts, policy makers, industry professionals, officials, social activists, etc., to add to the cornucopia of knowledge & skills and emprise to all the attendees, particularly the prospective engineers. Discussions in the conference on various imperative topics will add an insight to ponder and confer over crux of today's scientific and technological perk up. Our conference is a scientific rostrum to unveil the novel developments and to cogitate and conflate ideas and realities through practical experiences. ICATS is an unparagoned and an unmissable opportunity to engross the adaptive technologies bobbing in the modern age. The events of the conference include plenary sessions, paper presentation, poster sessions, pre and post conference tour and exhibition of innovative product from manufacturers in order to promote innovative, cost-effective, Eco-friendly, socially and technically feasible products and practices.

ABOUT THE CONFERENCE

The International Conference on Adaptive Technologies for Sustainable Growth (ICATS-2024) is organised in unison by 21 Departments at Paavai. The foremost aim of the conference is to foster collaboration among scientists, research scholars, engineers, and industry experts from various universities, colleges, and industries to exchange innovative ideas, industry experiences, and research outcomes in engineering and technology. It serves as a congenial platform for multidisciplinary and interdisciplinary approaches, paving way for participants to showcase and deliberate their innovative research ideas and developments. Additionally, the conference aims to facilitate networking among researchers on both national and global scales, disseminate knowledge about cutting-edge technological advancements, and encourage the inclusion of innovative ideas from dynamic and adept minds in the field. Featuring plenary talks, keynote addresses, and paper presentations, ICATS-2024 promises to be an exciting platform for researchers and students to stay informed about the latest trends in engineering and technology.

Droni Drone For Community-Based Environmental Mapping And Monitoring

Shanu. k. m Saravanan. N Ramaswamy. R Midhunjiith. H Ajay. S

*Department Of B.E Aeronautical Engineering Nehru institute of Engineering and Technology
Coimbatore*

ABSTRACT

Small drones are mostly used in military applications but this time increasing in various civilian applications including mapping, monitoring, and also managing natural resources. Although the development of environmental remote sensing technologies and methods has been closely related to the study of forests, The bulk of the academics. Most drone research on forests has focused on mapping and monitoring fires, but some suggest that small drones are increasingly being used by timber companies and government forestry agencies for applications such as tree crown/gap mapping, forest stand mapping, and volume estimation. Although the early generation is not yet used In environmental applications their idea is to increase the drones of so the way price decreases and become more familiar and easier to use

Keyword

CBEMM (Community-Based Environmental Mapping and Monitoring)

INTRODUCTION

As with technologies such as GPS, small drones were initially developed for military use, but are increasingly being deployed in civilian applications including mapping, monitoring, and managing habitats and natural resources. Although small drones are not used widely in environmental applications yet, their use is likely to increase rapidly as their prices decrease and the technology becomes easier to use

- The tropical environment and forest play a critical role in the global carbon cycle and harbor around two-thirds of all known species. Large tracts of environment and forest have long been inhabited by humans, thus leading to a significant overlapping between cultural and biological diversities

- Likewise CBEMM will be essential to the successful implementation of the Reduced Emission from Deforestation and Natural Degradation (REDD+) program across tropical communities because CBEMM has a significant advantage over the government and other organizations working in community environmental
- CBEMM is usually carried out through conventional ground surveys to gather environmental data inventories by mapping variables in permanent plots such as diameter at breast height (dbh), Monitoring environmental data, surveillance, videography, and climate reading sensors.
- We first provided a brief overview of such uses, including the types of drones that could be employed especially for CBEMM. We then outline and briefly discuss the key advantages and disadvantages that we expect from the use of small drones for CBEMM, and firsthand experience flying small drones for mapping and monitoring tropical forests and training people to operate them.

LITERATURE REVIEW

Small Drone for Community-Based Forest Monitoring: An Assessment of Their Feasibility and Potential in Tropical Areas

In this journal, they have concluded that there is a clear lack of methods and approaches able to provide solutions considering the resistance of mission planning to changing the Environmental conditions and accommodating the effects of Mapping and Monitoring

Using Low-Cost UAVs for Environmental Monitoring, Mapping, and Modelling

In the thesis, consider some of the current aerial platforms, sensors, technological developments, and the means by which data and image capturing can now be processed into information. Coupled with the development of ready-to-fly technology, low-cost digital cameras, GPS, software, and multispectral, hyperspectral, and LiDAR sensors these are evolving into the sophisticated system now in use.

PROCEDURE

- ***Planning*:** Identify the area to be mapped and determine the objectives of the mapping mission. Consider factors like terrain, weather conditions, and regulatory requirements.
- ***Equipment Setup*:** Ensure your drone is equipped with the necessary sensors for environmental monitoring, such as cameras (RGB, multispectral, or thermal), LiDAR, or gas sensors depending on the specific needs of the project.
- ***Flight Planning*:** Use drone flight planning software to create a flight path that covers the entire area of interest. This path should ensure adequate overlap between images for accurate mapping.
- ***Data Collection*:** Fly the drone along the planned flight path, collecting imagery or sensor data as per the mission objectives. Ensure safe operation and adherence to any airspace regulations.
- ***Data Processing*:** After the flight, process the collected data using specialized software. This may involve stitching together images to create orthomosaics, generating digital elevation models (DEMs) from LiDAR data, or analyzing spectral data from multispectral sensors.
- ***Analysis and Interpretation*:** Analyze the processed data to extract relevant information about the environment. This could include identifying land cover types, assessing vegetation health, detecting pollution sources, or monitoring changes over time.
- ***Reporting and Visualization*:** Present the findings in a clear and actionable format, such as maps, reports, or interactive visualizations. Communicate results to stakeholders and decision-makers for informed environmental management.
- ***Iterative Monitoring*:** Repeat the mapping and monitoring process at regular intervals to track changes in the environment over time and assess the effectiveness of any interventions or management strategies.

FUTURE WORK

Future work in environmental mapping and monitoring using drones is likely to focus on enhancing data collection efficiency, accuracy, and analysis. This could involve

advancements in drone technology, such as improved sensors for measuring environmental parameters, increased autonomy for longer flight times and coverage, and better integration with artificial intelligence for data analysis and decision-making. Additionally, there may be a greater emphasis on standardization and collaboration to ensure the interoperability of data collected from various sources and platforms.

1. Real-time data collection
2. Tracking climate change impacts
3. Identifying areas for conservation or restoration efforts

We can expect continued innovation in cartography technique, including 3Dmapping, Augmented reality overlays, and crowd-sourced mapping initiatives to enhance the accuracy and accessibility of geographical information

DESIGN DETAILS:

Environmental mapping camera

This is capturing high-resolution photography and overlapping vertical images from an airplane

- Also this will sense the disaster happens in the environment with specified sensors
- Environmental Monitoring: Mapping cameras can be used to monitor changes in vegetation, land cover, and other environmental features over time. This data is valuable for understanding trends in biodiversity, habitat loss, and ecosystem health.
- Ecological Research: Researchers use mapping cameras to study animal behavior, population dynamics, and habitat usage. The cameras can capture images of wildlife

in their natural habitats without disturbing them, providing valuable insights into their ecology.

- **Conservation Planning:** Mapping cameras help conservationists identify important habitats and prioritize areas for protection. By mapping biodiversity hotspots and sensitive ecosystems, conservation efforts can be more effectively targeted.
- **Land Management:** Mapping cameras are used by land managers to assess the impact of human activities such as logging, mining, and agriculture on the environment. This information helps inform sustainable land-use practices and minimize ecological damage.
- **Disaster Response:** In the event of natural disasters such as wildfires, floods, or hurricanes, mapping cameras can be deployed to assess damage to the environment and plan recovery efforts. They provide high-resolution imagery that can be used for damage assessment and resource allocation.
- **Education and Outreach:** Mapping cameras can also be used for educational purposes, allowing students and the public to explore and learn about different ecosystems and the threats they face. They can be integrated into interactive exhibits, virtual tours, and citizen science projects to engage people in environmental issues.

Using drones for mapping advantages:

- **Cost-effective:** Drones are often more cost-effective than traditional aerial survey methods such as manned aircraft or satellites. They require less fuel and manpower to operate, making them a more affordable option for many

- **Flexibility:** Drones can be deployed quickly and easily to almost any location, providing on-demand aerial imagery without the need for lengthy setup times or specialized infrastructure.
- **High Resolution:** Drones equipped with mapping cameras can capture high-resolution imagery with pixel-level detail. This allows for accurate mapping and analysis of small features such as individual trees, buildings, or terrain variations.
- **Accessibility:** Drones can access hard-to-reach or dangerous areas that may be inaccessible to ground-based survey teams. They can fly at low altitudes and maneuver through tight spaces, making them ideal for mapping rugged terrain, dense forests, or urban environments.
- **Rapid Deployment:** Drones can be deployed rapidly in response to emergencies or time-sensitive situations. They can provide real-time aerial imagery for disaster assessment, search and rescue operations, or environmental monitoring.
- **Data Accuracy:** With advances in GPS technology and onboard sensors, drones can capture georeferenced imagery with high positional accuracy. This allows for precise mapping, measurement, and analysis of features on the ground.
- **Safety:** Using drones for mapping reduces the need for workers to access hazardous or unstable terrain, minimizing the risk of accidents and injuries.
- **Environmental Impact:** Drones have a smaller environmental footprint compared to manned aircraft, as they produce fewer emissions and noise pollution. This makes them a more environmentally friendly option for aerial surveying.

RESULTS

In this paper, we have evaluated the prospects, challenges, and opportunities of using small drones for CBEMM in tropical areas as a way to improve forest monitoring, which is central to effective REDD+ implementation and other conservation efforts. The subject is very topical and relevant because the reduction and prevention of tropical deforestation and forest degradation is a climate mitigation option with a large and immediate carbon impact globally and is essential to global biodiversity conservation. Given the rapid drone technology developments, we argue that the drone-assisted approach to CBEMM suggested

and evaluated in this paper has great potential to enhance CBEMM. We suggest that this camera has 1020q and 4K pixel quality as well and the drone are wide range of covering an area of around 1500m approach is feasible in many tropical locations as long as some degree of environmental community already exists or communities have expressed sincere interest in implementing these new technologies. We expect that most of the current constraints and challenges identified in our assessment will be surmounted relatively soon as technology is rapidly improving in terms of cost, quality, and ease of use by non-experts. In addition, we posit that the utilization of small drones for CBEMM in tropical forests has potential benefits for livelihood support despite the potential social problems we have discussed. This CBEMM approach could represent an excellent opportunity for communities wishing to enhance their institutional capacities for natural resource governance and thereby the management and conservation of their forest resources, regardless of whether they wish to engage in REDD+ or other similar PES programs as a way to diversify their income sources. The utilization of small drones by communities in CBEMM programs should also bring substantial benefits to partner organizations and forest data end-users, who need to respond to current international forest policy data requirements, particularly those of REDD+. Nevertheless, before attempting to implement a drone-assisted forest monitoring program based on

Abstract

When Aircraft or any automobile vehicles moving in the fluid medium it can face drag. In this project we have analysed the different wing and found the co-efficient of lift and co-efficient of drag and lift per drag ratio. The middle and Blended wing are simulated in computational fluid dynamics software. And then the geometries designed by using Catia and ICEMCFD. The purpose of the analysis is to find the maximum lift location of wing and minimum drag location of the wing especially in blended and middle wing. A BWB configuration has a superior in-flight performance due to higher l/d ratio and could improve upon existing conventional aircraft in the area of noise emission, fuel consumption and direct operation cost on surveys. BWB configuration needs to employ a new structural system for passenger safety procedures such as passenger ingress. The beneficial results of the BWB design were that the parasite drag was decreased and span wise body as an own whole can generate lift. In this research conceptual BWB designs and CFD simulations were iterated to evaluate the aerodynamic performance of an optimum BWB design and theoretical calculations of structural analysis was done based on CFD results.

Introduction

The Blended is a hybrid shape that resembles a flying wing, but also incorporates features from conventional transport aircraft. This combination offers several advantages over conventional tube-and wing airframes. The main advantage of blended wing is to reduce wetted area and accompanying from drag associated with a conventional wing-body

junction. It may also be given a wide air foil-shaped body, allowing the entire craft to generate lift and thus reducing the size and drag of the wings. The conventional aircraft configuration has remained essentially unchanged for the last six decades and is approaching a productivity and capacity asymptote around the size of Airbus A380. Blended wing body aircraft is applied in the field of military, commercial concept indicate drastic performance improvements such as approximately 28% reduced fuel burn per passenger compared to a conventional configuration. This BWB configuration is a new concept in aircraft design which expects to offer great potential to substantially reduce operating costs while improving an aerodynamic performance and stability for both passenger and cargo mission. The BWB concept design was analysed an aerodynamic feature using Computational Fluid Dynamics (CFD). The aim of this paper is to design and analyse a BWB baseline and study the optimal control surface design, regarding its aerodynamic, stability and control features. The scope of the work is focused on the conceptual design stage and the preliminary definition, but it is sufficient to create an initial view of the BWB aircraft and make a first analysis.

Introduction about CFD Analysis

Computational Fluid Dynamics is the analysis of fluid flows using numerical solution methods. Using CFD, you are to analyse complex problems involving fluid-fluid, fluid-solid or fluid-gas interaction. CFD analysis is used to predict drag, down force, and stability against cornering or crosswind flow. Other automotive applications include engine and thermal performance, ventilation, exhaust fumes.

CFD is the use of applied Mathematics, Physics and computational software's to visualize how a gas or liquid flows as well as how the gas or liquid affects objects as it flows past. CFD provides the ability to theoretically simulate any physical conditions. CFD allows great control over the physical process, and provides the ability to isolate specific phenomena.

Mathematics of CFD

The set of equations which describe the processes of momentum, heat and mass transfer are known as the Navier-Stokes equations. These partial differential equations were derived in the early nineteenth century and have no known general analytical solution but can be

discredited and solved numerically. There are a number of different solution methods which are used in CFD codes. The most common, and the one on which CFX is based is known as the finite volume technique.

Methodology

Geometry formation

It is first step in CFD process. Mostly modelling of simple geometries and flow field is made using GAMBIT software. However-er for a complex geometry we need powerful CAD software such as pro-E or Solid works etc. Then initial design was made and was improved using pro-E and SOLIDWORKS, and then it was imported in GAMBIT where flow field for the problem was made.

Characteristics of design

- Symmetric air foil NACA 64a008 was selected at root chord to accommodate engine and other integral parts.
- For outboard wing, Eppler 342 was selected because it is specifically designed for tailless aircrafts and it possesses extremely low drag characteristics. Aspect ratio was of this air foil was variable at different sections of the wing to have a minimum frontal area
- Vertical section was added at wing to provide yaw stability

Flow field size

Size of flow field for the problem was selected relative to the size of our design. The dimensions were as following where L, W and H represent the length, width and height of our design respectively

Meshing

Next step after making flow field was meshing. GAMBIT was used for meshing and tetrahedral volumetric mesh was created in the flow field. Different mesh sizes were used for different zones and after mesh generation mesh quality were checked in terms of equalised skew. Zero value represents best element and one equisized skew represents

worst. In our case, the worst element came out to be 0.83 which is OK because FLUENT can solve Skagness up to 0.97.

Modelling Methodology

Solid works is a Para solid based solid modeller, and utilizes a parametric feature- based approach to create models and assemblies. Parameters refer to constraints whose values determine the shape or geometry of the model assembly. Parameter can be either numeric parameters, such as line lengths or circle diameters, or geometric parameters, such as tangent parallel. Concentric horizontal or vertical, etc. Building a model in solid works usually starts with a 3d sketch. The sketch consists of geometry such as points, lines arcs, conics and splint. Dimensions are added to sketch to define the size and location of geometry. Relations are used to define attributes such as tangency, parallelism, perpendicularly and concentricity.

Design and Model

Blended Wing Aircraft

Blended wing is the modulated from aerofoil and it has no clear lined between the wings. It has provided high lift generation. Configuration has a superior in-flight performance due to 1/d ratio and could improve upon existing conventional aircraft. The blended wing geometric designed on Catia the pressure contour is given below,

Figure 1. CATIA Design

Pressure Contour of Blended Wing Aircraft

Figure 2. Pressure Contour

Middle Wing Aircraft

Middle wing aircraft has geometric design on Catia and that given below,

Figure 3. CATIA Design

Pressure Contour of Middle Wing Aircraft

Figure 4. Pressure Contour

By Theoretical Method,

BWB design and theoretical calculations of structural analysis was done based on CFD results.

The formulae of lift are given as

$$L = \frac{1}{2} \times \rho \times v^2 \times CL \times A$$

Lift generated by wing

$$L_w = \frac{1}{2} \times 1.225 \times (8)^2 \times 0.615 \times 1.1665 = 28.12 \text{ N}$$

Lift generated by fuselage

$$L_f = \frac{1}{2} \times 1.225 \times (8)^2 \times 0.3 \times 0.6461 = 7.6 \text{ N}$$

Overall Lift

$$L = L_w + L_f$$

$$= 28.12 + 7.6$$

$$= 35.72 \text{ N}$$

Conclusion

We are analysing both wings of blended wing and middle wing aircraft. When comparing the both aircraft, the blended aircraft has high L/D ratio and it has highly aerodynamic efficiency than middle wing aircraft. Due to the decreased parasite drag, blended wing aircraft has provided high efficiency of aerodynamic; the high LD causes low fuel consumption of blended wing aircraft and high engine efficiency. But the conventional aircraft has high stability than BWB for pitch, yaw and roll motion. For example, after an engine failure, it might be very difficult to control the yawing motion of the aircraft. The control allocation system can then be reconfigured in-flight such that more yaw control power is available with the control surfaces. This, of course, will result in less control power in pitch and roll. The investigation of control allocation systems for a blended wing body aircraft is an area of future research. Simply having less surface area for a given payload capacity is the blended wing body principle. We are concluded from the result is BWB has better performance and more efficiency than conventional aircraft.

Nozzle Design Optimization to Reduce Noise

Ramkumar. V H ,

UG Scholar, Department of Aeronautical Engineering, MITE, Moodbidri

Ezhilmaran. G,

Assistant Professor, Department of Aeronautical Engineering, MITE, Moodbidri

Abstract – Background

The two primary parts of an airplane that make the most noise are the engine and the nozzle. The exhaust jet and other subcomponent actuations are the main causes of engine noise. On the other hand, the nozzle noise is caused by the mixing of different-temperature and speed air streams.

Methods

This project study examines the chevron nozzle, which finds utility in airplanes. Additionally, a theoretical analysis is carried out to determine the chevron nozzle's effective design parameters. SOLIDWORKS software used to design several chevron nozzle designs. The nozzle's end shape is altered in a way that modifies the angle of saw tooth's triangular shape in terms of size and shape. Further, ANSYS FLUENT software analyzes the different designed nozzles. In order to obtain an efficient model, the Acoustic power and velocity of those models are computed and compared in this study.

Results

Chevron with 25 deg inclination model produces minimum Acoustic power and maximum velocity. Acoustic power of chevron with 25 deg inclination angle produces 35.82dB Acoustic power.

Keywords

Chevron nozzle; CFD analysis; Aircraft engine, Acoustic power.

INTRODUCTION

Researchers have focused their efforts recently on reducing aircraft noise pollution in two main systems the nozzle and the engine – because these two systems contribute significantly to aircraft noise pollution [1]. The chevron nozzle, which features a saw tooth pattern at its end edge, is one commercially available option for reducing nozzle noise [2]. The length of the jet plume is shortened by the triangle-shaped cutouts at the nozzle's trailing edge. On the other hand, chevron lowers jet noise and enhances mixing to the necessary degree. The predominant noise source is still jet noise, particularly during takeoff. The development of workable passive flow control methods for reducing jet noise has received a lot of attention. Prior to their application in commercial aircraft engines, the thrust penalties associated with these designs need to be minimized. Acoustic studies indicate that adding chevrons to the nozzle reduces sound pressure levels reasonably with an acceptable reduction in performance; however, the fundamental mechanisms underlying the Acoustic benefit and the impact of different geometric parameters of chevrons remain unclear. Specific parameters like the number of lobes in a chevron, the length of a lobe, and the degree of penetration of the chevrons into the flow have been studied under a range of flow conditions. While experiments are essential for validating the computations, they are costly and only yield a limited amount of data. Therefore, having trustworthy CFD capabilities is ideal for swiftly assessing initial concepts for noise reduction. Callendar et al.'s [3] investigation of the nozzle's total sound pressure level involved measuring the effective frequency and adjusting the chevron blade's angle. In order to shed light on how geometric features affect Acoustic noise, the researcher additionally conducted study using different numbers of lobes and penetration levels [4]. Relationships between chevron geometric parameters, flow characteristics, and far-field noise were established by Bridges J et al. [5]. Acoustic Mach Number (AMC) of 0.9 has been run in both cold and hot settings. Four comparison investigations have been conducted, and the results show that neither flow nor sound parameters are influenced by chevron length. Mean flow and Acoustic measurements were predicted by Kochet al. [6] by altering the pattern on the core nozzle. Numerical projections for single-stream chevron nozzle flow performance were published by Engblom et al. [7]. The goal of this project work is to assess the performance of various chevron nozzle profiles. To analyze the Acoustic performance, various chevron nozzle designs are modeled in

SOLIDWORKS software and analyzed in ANSYS CFD. The most efficient chevron shape is determined by evaluating flow parameters like pressure, Acoustic power, and velocity.

CAD Modeling

The present study aims to investigate the impact of varying chevron lobe profiles on overall sound pressure levels. Specifically, chevron penetration which is defined as the difference between the chevron's tip radii is maintained at zero for all nozzle profiles. The chevron nozzles that were chosen for the analysis is chevron-triangular shape with 25deg inclination nozzle.

Certain chevron profiles, as shown in Table 1, have different chevron counts, chevron lengths (mm), bent angles (deg), and exit diameters (mm). Furthermore, CAD models with various chevron profiles are displayed in Fig 1

S.No	Nozzle	Chevron count	Chevron Length (mm)	Bent Angle (deg)	Exit Diameter (mm)
1	Chevron-Triangular shape with 25 deg inclination	10	17.42	25	50.8

Table1.Geometric details of the nozzle

Figure 1: Model of Chevron Triangular Shape With 25 Deg Inclination

CFD Analysis

This work employs CFD analysis to evaluate the Acoustic power and velocity profile of the various chevron nozzle designs in order to establish the effective design parameters. We

have performed jet simulations at a stagnation temperature of 300K. The input pressure is 2026500 Pa, and the output pressure is 506625 Pa.

Results and Discussion

Using SOLIDEDGE designing of baseline and chevron nozzle models are done. And virtually examined using ANSYS CFD. Since convergence in ANSYS CFD software is an iterative process, the CFD solver performs multiple iterations to acquire the velocity distribution and acoustic power. The Acoustic power and velocity distribution obtained from the CFD-post (result) in the CFD tool are the outputs of the CFD solver.

Chevron triangular with 25-degree inclination (2026500 pascals)

The results of the CFD solver, which are 25-degree inclination nozzle model's velocity distribution and Acoustic power, are displayed in Fig.2 and Fig.3. The Acoustic power produce is 98.8db. The velocity produce for the above profile is 920m/s under the boundary conditions of 2026500 pascals pressure at inlet and 506625 pascals at outlet of the nozzle.

Figure 2: Acoustic power of the Chevron Triangular with 25-Degree Inclination

Figure 3: Velocity of the Chevron Triangular with 25-Degree Inclination

Chevron triangular with 25-degree inclination (1519875 pascals)

The results of the CFD solver, which are 25-degree inclination nozzle model's velocity distribution and Acoustic power, are displayed in Fig.4 and Fig.5. The Acoustic power produce is 95.5db. The velocity produce for the above profile is 792 m/s under the boundary conditions of 1519875 pascals pressure at inlet and 101325 pascals at outlet of the nozzle.

Figure 4: Acoustic power of the Chevron Triangular with 25-Degree Inclination

Figure 5: Velocity of the Chevron Triangular with 25-Degree Inclination

Chevron triangular with 25-degree inclination (2533125 pascals)

The results of the CFD solver, which are 25-degree inclination nozzle model's velocity distribution and Acoustic power, are displayed in Fig.6 and Fig.7. The Acoustic power produce is 62.2 db. The velocity produce for the above profile is 797 m/s under the boundary conditions of 2533125 pascals pressure at inlet and 1013250 pascals at outlet of the nozzle

Figure 6: Acoustic power of the Chevron Triangular with 25-Degree Inclination

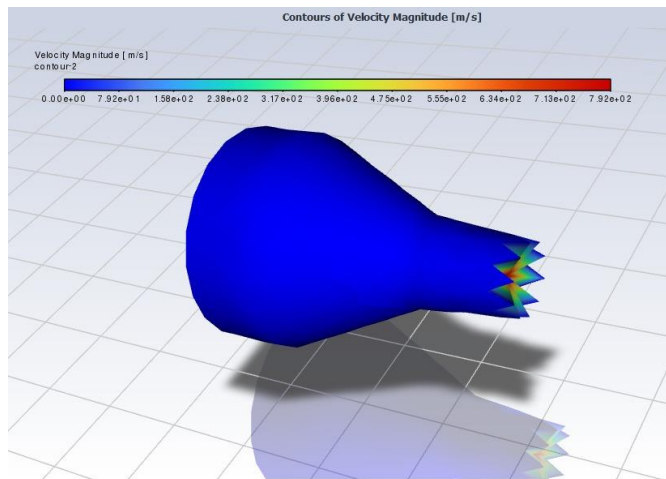

Figure 7: Velocity of the Chevron Triangular with 25-Degree Inclination

Chevron triangular with 25-degree inclination (2279812.5 pascals)

The results of the CFD solver, which are 25-degree inclination nozzle model's velocity distribution and Acoustic power, are displayed in Fig.8 and Fig.9. The Acoustic power produce is 97.3 db. The velocity produce for the above profile is 849 m/s. under the boundary conditions of 2279812.5 pascals pressure at inlet and 759937.5 pascals at outlet of the nozzle

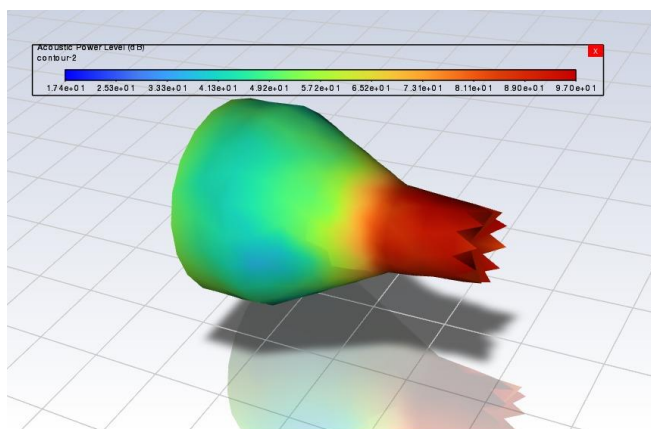

Figure 8: Acoustic power of the Chevron Triangular with 25-Degree Inclination

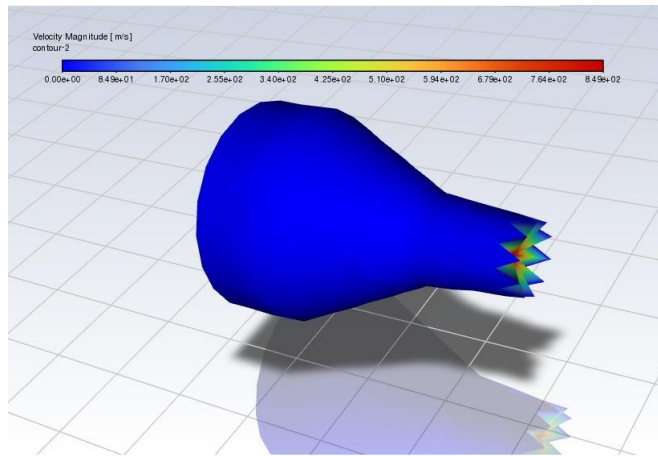

Figure 9: Velocity of the Chevron Triangular with 25-Degree Inclination

Chevron triangular with 25-degree inclination (1773187.5 pascals)

The results of the CFD solver, which are 25-degree inclination nozzle model's velocity distribution and Acoustic power, are displayed in Fig.10 and Fig.11. The Acoustic power produce is 100.2 db. The velocity produce for the above profile is 1012 m/s under the boundary conditions of 1519875 pascals pressure at inlet and 101325 pascals at outlet of the nozzle

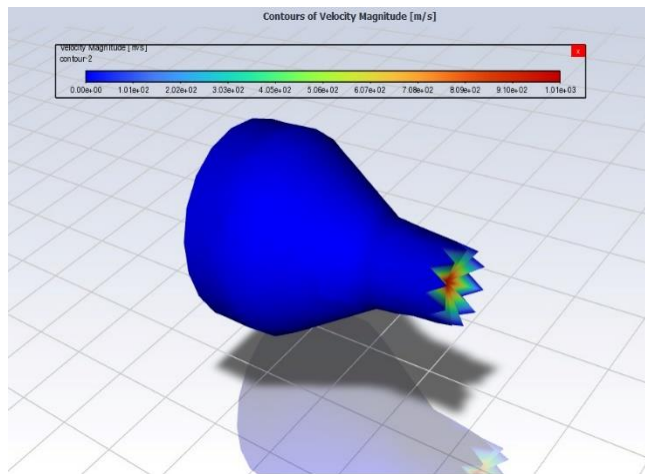

Figure 11: Velocity of the Chevron Triangular with 25-Degree Inclination

Conclusion

Several chevron nozzle designs have been taken into consideration in this project effort in order to determine the chevron nozzle's effective performance. Therefore, using ANSYS CFD, theoretical study is carried out to assess the velocity and Acoustic performance at the trailing edge of the chevron nozzle. The findings indicated that the trailing edge of the chevron triangular nozzle profile encounters very high velocity (920 m/s) and very low Acoustic power (98.8 dB). Given its effective performance, the chevron nozzle with a 25-degree inclination angle is advised for use in aviation engines based on theoretical fluid analysis.

Abstract

In preparing this paper an attempt has been made to present concisely the most important and useful results of static and dynamic analysis on environmental control system of reheater attachment for a typical naval fighter aircraft. In order to achieve this, the proper design, modeling, analysis and manufacturing of a component follows a well-defined organized system. This can be achieved by modernizing the system of working with the usage of special tools, techniques and up-to-date software. The typical naval fighter aircraft are subjected to arrest landing by landing hooks for short distance runway landing. During the time of arrest landing the shock load produced each and every structural component on the aircraft. The re-heater attachments are very important structural components of an aircraft as they resist very high loads resulting from arrest landing of a typical naval fighter aircraft.

Keywords

ECS, Re-heater attachment, naval fighter aircraft, shock load.

INTRODUCTION

Naval fighter aircraft

A naval fighter aircraft is a military aircraft designed primarily for air-to-air combat with other aircraft, as opposed to a bomber, which is designed primarily to attack ground targets by dropping bombs. The hallmarks of a fighter are its small size, speed and maneuverability. Many fighters have secondary ground-attack capabilities, and some are dual-rolled as fighter-bombers. Consequently, the term "fighter" is sometimes extended colloquially to include dedicated ground-attack aircraft.

Aircraft environmental control system

Aircraft pressure vessel which includes the cockpit (flight deck) cabin and interior compartments. Safety monitoring is also performed e.g. cabin altitude (ZC), cabin ΔP . On transport - category aircraft, ECS comprises various systems performing the following functions: bleed air supply, bleed leak detection, air conditioning, distribution, avionics cooling, cabin pressurization control, oxygen supply. The trend today is towards increasing integration of all air systems, including wing anti - ice/de- ice functions via common controller architecture. The current work done on the re-heater attachment on the typical naval aircraft. The attachment brackets installing on station 19A and 19B.

METHODOLOGY

Static and Dynamic analysis of aircraft stiffened panel

Stiffened panel is a component in aircraft that is used to fasten the stiffener and the skin. These are components that carry and allocate the loads throughout the surface of the fuselage or the wing. These panels are present in both fuselage and wings. When we consider the issue i.e. Resistance of the Aircraft's skin towards the load applied on it, due to frailty the Aircraft skin is easily deformed.

Static and Dynamic analysis of typical wing structure of Aircraft using NASTRAN

The main objective is to fix a approximate structure within the given envelope. Sizing is done by using classical Engineering theories and FEA packages (MSC Nastran and MSC patran) Skin and web.

Dynamic Analysis of Compression mounting bracket:

The compressor mounting bracket may fail due to response in dynamic analysis, but in the static analysis gives a realistic method for it design validation. With the use of the above methodology, a new compressor mounting bracket is analyzed and optimized, also, the importance of certain ribs or stiffness is studies using the proposed methodology.

SOFTWARE USED

Patran

Patran is the world's most widely used pre/post-processing software for Finite Element Analysis (FEA), providing solid modeling, meshing, and analysis setup for MSC Nastran, Marc, Abacus, LS- DYNA, ANSYS, and Pam-Crash.

Meshes are easily created on surfaces and solids alike using fully automated meshing routines (including hex meshing), manual methods that provide more control, or combinations of both.

MSC Nastran

Hence, MSC is a pioneerin simulation solutions to improve time-to-market. The company's solutions allow manufactures to accurately predict how their designs will behave in their intended environments, without having to build and test multiple physical prototypes.

STATIC ANALYSIS

Definition of Static Analysis

A static analysis calculates the effects of steady loading conditions on a structure, while ignoring inertia and damping effects, such as those caused by time-varying loads.

Loads in a Static Analysis

Static analysis is used to determine the displacements, stresses, strains, and forces in structures or components caused by loads that do not induce significant inertia and damping effects. Steady loading and response conditions are assumed; that is, the loads and the structure's response are assumed to vary slowly with respect to time. The kinds of loading that can be applied in a static analysis include: Externally applied forces and pressures, Steady-state inertial forces (such as gravity or rotational velocity), Imposed(non-zero) displacements, Temperatures (for thermal strain), Fluencies (for nuclear swelling)

Linear static analysis for re-heater attachment

Positive & negative static load case for Bracket 1 & 2:

Bracket 1 - $N_x=6$, $N_y=3.44$, $N_z=8.45$ Bracket 2- $N_x=-4$, $N_y=-3.44$, $N_z=-5.84$

Calculation for static loads Positive load factors

$$F_x = 6 * 9.81 * 1.5 * 6.35 = 560.641 \text{ N}$$

$$F_y = 3.44 * 9.81 * 1.5 * 6.35 = 321.434 \text{ N}$$

$$F_z = 8.45 * 9.81 * 1.5 * 6.35 = 789.570 \text{ N}$$

Negative load factors

$$F_x = -4 * 9.81 * 1.5 * 6.35 = - 373.761 \text{ N}$$

$$F_y = -3.44 * 9.81 * 1.5 * 6.35 = 321.434 \text{ N}$$

$$F_z = -5.84 * 9.81 * 1.5 * 6.35 = 545.691 \text{ N}$$

R.F calculation:

$$R.F = \text{Ultimate stress} / \text{applied stress} \quad (\text{ultimate stress} = 440 \text{ Mpa}) \quad (1)$$

Experimental tabulation

By comparing actual and optimize design (1&2) for bracket 1 and bracket 2 in which keeping mass constant in 1D by varying mass and thickness in 2D is given in the table below

Table 1 Properties for bracket-1 (actual and optimized design 1 and 2)

Element/ property	Material	Mass in kg	Thickness in mm
0D	Aluminum	6.35	-
1D	Aluminum	-	1
2D	Aluminum	1.3	3
optimized design-1			

2D	Aluminum	0.8	3
optimizedesign-2			
2D	Aluminum	0.694	2.5

Table2 Properties for bracket-2 (actual and optimized design 1 and 2)

Element/ property	Material	Mass in kg	Thickness in mm
0D	Aluminum	6.35	-
1D	Aluminum	-	1
2D	Aluminum	0.68	3
optimizedesign-1			
2D	Aluminum	0.58	3
optimizedesign-2			
2D	Aluminum	0.56	2.5

Table3 Static analysis tabulated result

Component	Model	M Kg	L-1 Mpa	L-2 Mpa	R.F (no unit)
Bracket-1	Actual	1.3	100	92.1	4.4
	Optimize-1	0.83	132	97.2	3.3
	Optimize-2	0.69	139	100	3.1
Bracket-2	Actual	0.68	96.5	72.6	4.5
	Optimize-1	0.58	98.5	74.6	4.4
	Optimize-2	0.56	102	81.4	4.3

Discussion

Bracket-1 and Bracket-2:

Static analysis for bracket-1 has been done and the values are tabulated. From this value we came to know that R.F values are much high. So we have done the weight optimization process. By the optimization process we reduced the weight and required R.F value is attained.

MODAL ANALYSES

Model analysis dynamic characteristic

The structure exposed to dynamic forces, the knowledge of dynamic characteristics of these structures is of great importance. The most important intrinsic dynamic characteristics of linear dynamic systems are the natural frequency, the associated mode shape, Damping.

The natural frequencies and associated mode shapes may be analyzed for both damped and un-damped linear dynamic systems. When a structure, machine or any system is excited, its response exhibits a sharp peak at resonance when the forcing frequency is equal to its natural frequency when damping is not large. Since any dynamic response of a structure can be obtained as a combination of its modes, knowledge of the mode shapes, modal frequencies and modal damping ratios constitute a complete dynamic description about the structure.

The deflection shape measured is valid only for the force /frequency associated with the operating conditions; as such, we cannot get information about deflections under other forces and frequencies.

However, the measured deflection shape can be quite useful. For example, if a particular part or location is found to have excessive deflection, we can stiffen that part or location. This in effect, increases the natural frequency beyond the operational frequency range of the system.

Model analysis of re-heater attachment

The model analysis of the re-heater attachment on station 19a and 19b is done by the following procedure. Attachment bracket surfaces are extracted and meshed and given the property to the finite elements. 0D point element created on the cg point of the re-heater and applied the lumped mass property to the 0D element.

LRU attachment points are attached to the 0 D lumped elements by creating 1D beam element between the points and 0D element. The boundary coordinates are specified and the nodes are translationally constrained at x,y,z direction on the specified node. The same procedure followed for all the constrained points.

Modal analysis followed by the given bracket by using MSC patran and analysis done by using MSC nastran and the frequency carefully noted on both the given and optimized brackets.

Experiment and tabulation

In this model analysis we calculating the values of Mode 1 & Mode 2 frequency levels by varying the mass of actual and optimize design 1 and 2 to analyze the dynamic characteristics.

Table4Modelanalysisistabulated result

Component	Model	Mass in kg	Mode1&2Frequency in Hz
Bracket-1	Actualdesign	1.3	37.87,53.85
	Optimizedesign-1	0.83	29.79,38.72
	Optimizedesign-2	0.69	25.79,34.05
Bracket-2	Actualdesign	0.68	4.8,5.2
	Optimizedesign-1	0.58	4.5,4.8
	Optimizedesign-2	0.56	4.3,4.7

Discussion

Bracket-1:

Modal analysis for bracket-1 actual design having the above tabulated values. The optimized design 1&2 having the lower frequency to compare with actual design analysis shown in table.

TRANSIENT RESPONSE ANALYSES

Forced dynamic response

Transient response analysis is the most general method for computing forced dynamic response. The purpose of a transient response analysis is to compute the behavior of a structure subjected to time varying excitation. The transient excitation is explicitly defined in the time domain. All of the forces applied to the structure are known at each instant in time. Forces can be in the form of applied forces and/or enforced motions

Integration Time Step

For a given integration time step, integration errors increase with increasing natural frequency because there is an upper limit to the frequency that can be represented by a given time step. Also, integration errors accumulate with total time. In both direct and modal transient analysis, the cost of integration is directly proportional to the number of time steps. For example, doubling the load duration doubles the integration effort. In specifying the duration of the analysis on the TSTEP entry, it is important to use an adequate length of time to properly capture long period (low frequency) response.

Calculation formula for transient response analysis

Calculating time step

$$\text{Time period}(t)=1/f \quad (2)$$

f =mode frequency

$$\text{Number of timesteps} = T/t \quad (3)$$

T = transient time period Nonspatial PCL-expression:

$$294.*\text{sind}(600.*t) \quad (4)$$

In transient response analysis we analyze the force dynamic responses for bracket -1 and bracket - 2 by varying the mass in which there is a change happens in actual and optimization design 1&2, stress values along x, y and z directions. The model calculation is given for actual design and bracket - 1 (optimization) is given below

Bracket-1(actual design)

Timeperiod(t)

$$= 1/f \quad (f=513.56)=1/(10*513.56)=\mathbf{1.94e-4sec}$$

$$\text{Number of time steps} = T/t(T=0.030sec)$$

$$=0.030/1.94e-4=\mathbf{154.6sec}$$

Shock vonmises stress on x direction=55.6Mpa

Shock vonmises stress on y direction=63.7Mpa

Shock vonmises stress on z direction=91.6 Mpa

Bracket-1(optimize-1)

$$\text{Time period}(t)=1/f(f=420)$$

$$=1/(10*420)=\mathbf{2.38e-4sec}$$

$$\text{Number of time steps} = T/t(T=0.030sec)$$

$=0.030/1.94e-4=126.05\text{sec}$

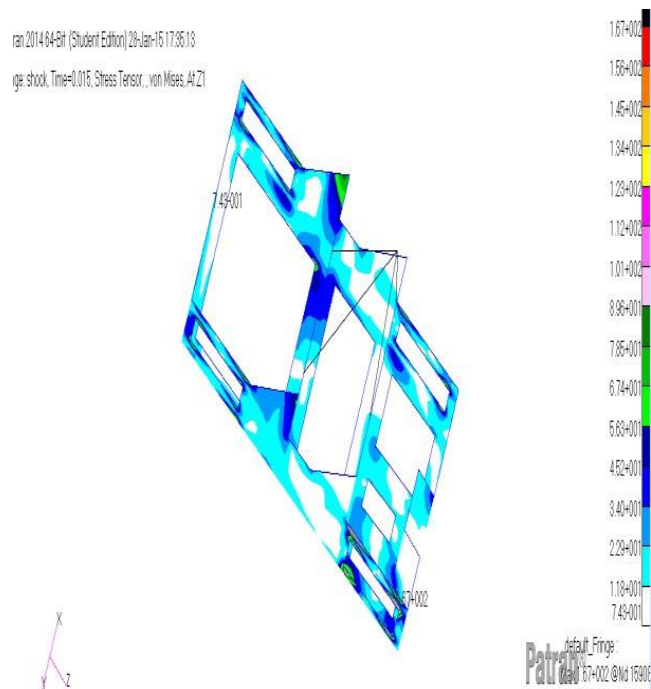

Figure1-Shockvonmisesstressonxdirection=110Mpa

Figure2-Shockvonmisesstressonydirection=184Mpa

Figure 3: Shockvonmisesstressonzdirection=113Mpa

Table 5 Transientresponseanalysis

Component	Model design	Mass inKg	σ (x) Mpa	σ (y) Mpa	σ (z) Mpa
Bracket-1	Actual	1.3	55.6	63.7	91.6
	Optimize-1	0.83	110	184	113
	Optimize-2	0.69	146	262	163
Bracket-2	Actual	0.68	292	119	104
	Optimize-1	0.58	612	174	159
	Optimize-2	0.56	738	193	242

Discussion

Bracket-1andBracket-2

Transient response analysis for bracket-1 has been done and the values are tabulated. From this value we came to know that R.F values are much high. So we have done the weight optimization process. By the optimization process we optimized the weight and the von-mises stress.

CONCLUSION

Static and dynamic analysis of a environmental control system of re-heater attachment for a typical NAVAL fighter aircraft. is carried out using finite element stress analysis package MSC PATRAN/NASTRAN to find out maximum stress and minimum stress.

In the above work we get the ECS component of a re-heater attachment done the static and dynamic analysis and get the mode frequency and the maximum and minimum von mises stress. According to the values to plan to increasing the R.F values because many of the surfaces on the component having low stress. The stress plan to be increased four times to its actual value. Optimizing of the given brackets done by design the holes and reduce the thickness of the component.

Design the static and dynamic analysis carried out on it. Finally we increase on mises stress of the brackets compare to its actual design. The plan of future work is to optimize the design parameters which include thickness and materials of brackets to find the three dimensional stresses occurring in the body by various loading conditions.

STRUCTURAL DESIGN AND DEVELOPMENT OF VORTEX BLADELESS WIND TURBINE FOR WIND ENERGY HARVESTING

Dr. ARRAVIND. R,

*Head Of The Department, Department Of Aeronautical Engineering, Paavai Engineering
College, Nammakal, Tamilnadu*

ABIL. K, ARSATHPARVEZ. M, MOHAMED ALAMEEN. R, SUSIGARAN. G,

*Students, Department Of Aeronautical Engineering, Paavai Engineering College, Nammakal,
Tamilnadu.*

Abstract

This work presents a novel design and fabrication approach for a vortex bladeless wind turbine (VBWT). Unlike conventional wind turbines with rotating blades, VBWTs harness wind energy through vortex shedding, a phenomenon where wind flowing past a stationary structure creates oscillating vortices. This innovative design aims to address limitations associated with traditional wind turbines, such as noise generation, bird strike hazards, and large land use requirements.

The proposed VBWT focuses on "optimizing the structure's shape to enhance vortex shedding efficiency" and "utilizing a unique material combination for a lightweight yet robust design". This design is particularly suited for applications in "urban environments with limited space constraints" and "off-grid power generation in remote locations". The anticipated benefits of this renovative design include "improved energy extraction efficiency from wind" and "reduced noise pollution compared to traditional turbines". The successful development of this VBWT could contribute significantly to the advancement of sustainable and environmentally friendly energy solutions.

ENHANCING IMAGE AND DATA PROCESSING FOR REAL TIME OBJECT RECOGNITION DRONE

MR. RAJ KUMAR. D, M,E,

*Assistant Professor, Department Of Aeronautical Engineering, Paavai Engineering College,
Nammakal, Tamilnadu*

MOHAMMED KAIF. S, NANTHA KUMAR. A, RADHA KRISHNAN T,

*Students, Department Of Aeronautical Engineering, Paavai Engineering College, Nammakal,
Tamilnadu.*

ABSTRACT

The Design and Fabrication of Enhancing Image and Data Processing for Real-Time Object Recognition Drone aims to revolutionize surveillance and reconnaissance operations through advanced image and data processing capabilities integrated into UAVs. Traditional drones often rely on pre-defined algorithms or external processing units for object recognition, limiting their adaptability and real-time response. This project proposes a novel approach by embedding sophisticated image processing and machine learning algorithms directly onto the drone, enabling real-time object recognition and classification.

The project encompasses the design and fabrication of a custom UAV platform equipped with high-resolution cameras, onboard processing units, and communication interfaces. Additionally, the development of efficient algorithms for image preprocessing, feature extraction, and deep learning-based object recognition plays a crucial role in achieving real time performance and accuracy.

The proposed drone system holds significant potential across various applications, including surveillance, search and rescue, agriculture, and environmental monitoring. By enhancing image and data processing capabilities for real-time object recognition, the project aims to elevate the effectiveness, efficiency, and autonomy of UAV-based operations, paving the way for more advanced and intelligent aerial platforms in the future.

DESIGN AND DEVELOPMENT OF ANEMOKINETICS BASED ENERGY HARVESTING SYSTEM

ABSTRACT

This project presents a new Energy harvesting technique for capturing minute amounts of energy from one or more of the surrounding energy sources, accumulating them and storing them for later use. The energy harvesting trees are super eco-friendly synthetic trees will make use of renewable energy from the sun along with wind power, which are an effective clean and environmentally sound medium of gathering solar radiation and wind energy. The artificial trees are implanted with Nano leaves, a composite of nano photovoltaic nano-Thermo voltaic and nano-piezo sources transforming light, heat and wind energy into eco-friendly electricity. Another name given to energy harvesting is energy scavenging. Energy harvesting as an alternative technique that has been applied to solve the problem of finite node lifetime and it refers to harnessing energy from the environment or other energy sources for converting it to electrical energy. Harvesting energy from the surrounding environment is of growing interest to the research community. So a technique has been presented here which can be used for the efficient energy harvesting by creating trees. The electrical energy from all the leaves and twigs is stored at the bottom of the tree by using the storing device. The piezoelectric sensor will then send the signal into the NODEMCU and transform it into electrical energy. The Internet net of things (IOT) will then displayed the amount of voltage generated by the circuit.

A NIGHT PATROLLING SURVEILLANCE WITH MEDICINE DELIVERY

ABSTRACT

Night Flying – In this article, we demonstrate a advanced night time monitoring system that uses drones with Infrared camera.

Medicine delivery box – In this article, we are implementing a medicine drone delivery system using CC3D flight controller which is configured using open pilot ground control station Software.

By using CATIA V5 software the entire medical delivery with IR camera will be designed taking the prototype and problem identification from garuda aerospace (droni drone) the solution will be given in form of experimental value , analytical value , stimulated design will be submitted to R&D department in garuda aerospace.

Keywords

Droni drone(Garuda Aerospace), Night Patrolling IR camera, Medical Delivery Kid

INTRODUCTION

Medicine delivery – In India, there are many cases reported where the late delivery of medicines to any health organization therefore this drone delivery project will come handy in case of efficient delivery of medicines in cities where bad condition of situation. We have seen drones applications in farming equipment where it is used to spread medicine in the organic fields, In the same manner we have developed drone which is able to deliver

essential and vital medicines in the areas where proper transformation is not available for the native people.

This drone is capable of delivering the medicines to the places where it cannot be transported using any mechanical vehicle commonly used by all delivery agency, In any pandemic situation where human interaction are not advised.

LITERATURE REVIEW

Medicine Delivery drone with attachment of kit Prof. Sudhir Kadam. (2020) Medicine Delivery drone, International Journal of engineering research and Technology (IJERT) 2020.

This project is helpful in providing necessary medicine in areas where normal traffic transportation services are not and also in region where the geographical terrain is not fit for traditional transportation.

Intelligent night surveillance using drone.

Rendeiro, Margarida, “ intelligence of obedience and creativity for sub version drone” (2018) CCRC Press-2019

Using drone for night surveillance can provide a number of advantages including enhanced visibility cost Effectiveness. It also have some disadvantages such as limited flight time privacy concern and limited payload capacity

DESIGN DETAILS

During the design of flex beam the following consideration are needed,

- Flap-lag-torsion deformation must be accommodated through the flex beam.
- There should be balance between maneuverability and dynamic vibrations.
- Hub size must be kept at a minimum in order to reduce the weight and hub drag.
- In order to maximize in-plane damping, the optimum tailoring at the damper and in-plane flex beam deformation must be obtained.
- Flex beam design criterion includes rotor shaft/mast/hub impedance characteristics.
- Cross-section of flex beam.
- Composite material type and configuration.
- Hub and blade attachments and configurations..

- Material used: S2-fiber glass impregnated with a 350F curing (toughened epoxy resin system)

DESIGN ASPECTS

- 48 Megapixel cameras with 4K/30 frames per second are supported by Droni. To capture cinematic videos and discover new angles, use a 1/2.3-inch CMOS sensor with 48 million effective pixels and stable 3-AXIS GIMBAL 3(pitches, yaw, roll).
- An improved remote controller including a 3-to 4-kilometer HD range, intelligent voice somatosensory control, and a 30- minute flying duration for unbroken aerial exploration
- Small-sized A foldable quadcopter that fits into a pocket and a drone that is built to weigh only 249 grammes with wind resistance up to seven levels
- Intelligent Flight Modes: 11 Stunning Flight Modes with Just One Simple Click Techniques for Straight Forward Shooting, Circling Follow-me, Broad Shooting, Intelligent Follow, Quadrangle Follow-me, God-like Perspective, Fading, Time-lapse Photography, Soaring, Tail Flicking, and Simplifying Cinematic Shooting Techniques to a Single Click and FPV Using a virtual flight simulator, you can experience every frame that your drone captures.
- HD Anti-Shudder Camera With its three-axis mechanically stabilised pan tilt, the Garuda Droni leaves no opportunity for blurry or unsteady photos. You can precisely locate the longitude and latitude of the ground target and measure the target spot with Droni. The gimbal helps with mirror shots and provides automatic target tracking. Large areas can also be shot without using the gimbal.
- Flight, Voice & Somatosensory Control with f/2.6 Aperture For Bright Captures and 83° Ultra-low Distortion Wide-angle Lens
- One-throw-flight enables an unrestricted takeoff and increased UAV adaptability, The perfect blend of visual optical flow and TOF positioning makes stable indoor shooting possible
- This new upgrade lets you transfer all your media instantly and perform high-speed Wi-Fi download (up to 8m/s). The app operation interface follows a simple design for a pleasant user experience.

- Droni APP for Android, 6 Month WARRANTY, 11 FLIGHT MODES - Easily preview clips and effortlessly capture aerial videos. Switch between flight modes such as all powered by AI. Enjoy peace of mind with Six Month warranty support pan India.

MATERIAL USED:

- Recommended Uses For Product Night Vision, Motion Detection
- Brand BLUELEX
- Model Name BLUELEX Mini
- Connectivity Technology Wireless
- Special Feature
- HD 1080p, 30fps, motion detection, 5m night vision distance, Magnet Tabs, Can be used as outdoor camera(waterproof) HD 1080p, 30fps, motion detection, 5m night vision distance, Magnet Tabs, Can be used as outdoor came...
- See more
- Indoor/Outdoor Usage Indoor
- Compatible Devices iPhones/ Android Phones/ PCs
- Power Source Battery Powered
- Connectivity Protocol Wi-Fi
- Controller Type Android

Night flying surveillance drone with IR camera

Medicine Delivery System Drone

DESIGN DETAILS:

- It has a large external panel subjected to the transient loading which occurs during the firing of the Hell firing missiles.
- It has multi-purpose latches, which must keep the door closed under mission loading.
- It must protect the equipment from the external environment.

Night flying surveillance drone with IR camera

Medicine Delivery System Drone

CONCLUSION

- The modifications of design will be made by using advanced camera.
- 48 Megapixel cameras with 4K/30 frames per second are supported by Droni. To capture cinematic videos and discover new angles, use a 1/2.3-inch CMOS sensor with 48 million effective pixels and stable 3- AXIS GIMBAL 3(pitches, waw, roll).
- An improved remote controller including a 3-to 4-kilometer HD range, intelligent voice somatosensory control, and a 30- minute flying duration for unbroken aerial exploration
- Small-sized A foldable quadcopter that fits into a pocket and a drone that is built to weigh only 249 grammes with wind resistance up to seven levels
- Intelligent Flight Modes: 11 Stunning Flight Modes with Just One Simple Click Techniques for Straight Forward Shooting, Circling Follow-me, Broad Shooting,

Intelligent Follow, Quadrangle Follow-me, God-like Perspective, Fading, Time-lapse Photography, Soaring, Tail Flicking, and Simplifying Cinematic Shooting Techniques to a Single Click and FPV Using a virtual flight simulator, you can experience every frame that your drone captures.

- HD Anti-Shudder Camera With its three-axis mechanically stabilised pan tilt, the Garuda Droni leaves no opportunity for blurry or unsteady photos. You can precisely locate the longitude and latitude of the ground target and measure the target spot with Droni. The gimbal helps with mirror shots and provides automatic target tracking. Large areas can also be shot without using the gimbal.

FUTURE STUDIES

And we will be using advance high resolution camera upto 1k mtr altitude in all direction.

ABSTRACT

This study explores the design, development, and implementation of a hybrid system combining a H-Darrieus wind turbine and a solar photovoltaic (PV) system. The increasing demand for clean and sustainable energy sources necessitates innovative solutions. The goal is to maximize power generation by harnessing complementary wind and solar resources, aiming for a more consistent and reliable power supply compared to standalone wind or solar systems. The H-Darrieus turbine's omnidirectional operation makes it suitable for various wind conditions, while the solar PV system capitalizes on sunlight for electricity production. Small VAWT is more suited for an urban setting, using Darrieus type turbine over Savonius type turbine for more suitable applications. Using NACA4412 blade shape design for a high tip speed ratio. Darrieus turbine gives us the benefit of the wind's drag and lift force. This wind turbine consists of three blades, technically an airfoil which is connected to radial arm and rotating main shaft. In this paper, the components required for this wind turbine like airfoil, main shaft and bearing are properly designed. The power calculation with respect to the wind velocity, swept area and number of blades are included. This project's primary goal is to employ vertical axis wind turbines and solar panels in daily life.

CHEMICAL CONSERVATION IN PLASTIC WASTE INTO FUEL

Mano. B,

Assistant professor, Department of Agriculture Engineering, Paavai Engineering College, Paavai nagar, Pachal, Namakkal-637018 ,Tamil Nadu, India.

Punith. M, Vasudevan. S, Rishik raagav. R S, Praveen. R.

Students, Department of Agriculture Engineering, Paavai Engineering College, Paavai nagar, Pachal, Namakkal-637018 ,Tamil Nadu, India.

Abstract

The increased demand and high price for energy sources are driving efforts to convert organic compounds into useful hydrocarbon fuels. Although much of this work has focused on biomass, there are strong benefits to deriving fuels from waste plastic material. Waste plastic is abundant and its disposal creates large problems for the environment. Plastic does not break down in landfills, it is not easily recycled and degrades in quality during the recycling process, and it can produce waste ash, heavy metals, and potentially harmful gas emissions if incinerated at high temperatures. However, thermal processes can be used to convert plastics into hydrocarbon fuels such as gasoline, diesel, aviation jet fuel, which have unlimited applications in airline industries, helicopter, heavy transportation, and electricity generation. The method and principal of the production / process will be discussed.

KEY WORDS

Organic compounds, Hydrocarbon fuels, Biomass, Waste plastic

DEVELOPMENT, EVALUATION AND SENSORY ANALYSIS OF PROTEIN RICH PANEER FROM AMARANTHUS (Amaranthus L.) SEED MILK

Varsha P Sarma, Monika. G

Gopika. A, Amirthananthi. K,

*Student, Department of Agricultural Engineering, RVS Technical Campus, Coimbatore, Tamil
Nadu, India.*

ABSTRACT

This study was carried out to develop paneer with Amaranth (Amaranthus L.) seed milk. Panner is a great source of protein and calcium, making it a nutritious addition to meals. Amaranthus seeds are small, edible seeds of the amaranth plant. They are often used as a nutritious ingredient in various dishes. Amaranth has a minimum protein content of 16 %, which is generally higher than those found in commercial varieties of common cereals. Amaranth protein has unique characteristics because its amino acid balance is close to the optimal balance required for human nutrition. The protein in amaranth grains (13-19%) has high digestibility (90%). Natural raw materials rich in dietary fibre (DF) and high in antioxidant capacity serve as functional ingredients for the food industry. The incorporation of Amaranth seeds into panner introduces additional health benefits. Milk is produced from sprouted amaranth seed, soaked amaranth seed and Roasted seeds. Developed paneer were stored at 40°C for 5 days shelf-life testing and titratable acidity and pH were tested during the storage. Nutritional composition of paneer was analysed. Sensory evaluation was done for fresh paneer samples using seven-point hedonic scale.

Keywords

Amaranthus seeds, Paneer, Protein, Shelf life, sensory evaluation

APICULTURE

Abstract

The science of beekeeping is known as apiculture. Apiculture makes use of low-cost, locally available resources that yield quick results. Honey bees are important for cross pollination and crop yield improvement, which is a profitable venture with environmental, socioeconomic and cultural implications. It can be expanded into a small business. The main objective was to assess the potential of apiculture as an alternative source of income generation through survey and field trials. The field trials employed the construction, baiting and mounting of Kenyan top bar beehives and for the survey. A profit could be obtained from apiculture using six beehives on an acre of land compared to a profit could be obtain from an acre of maize farm . Government agencies such as SADA and NGOs involved in afforestation should also promote apiculture to improve the vegetation of the region.

INTRODUCTION

Apiculture or beekeeping, is a promising branch of agriculture that has the potential to contribute significantly to environmental conservation and economic development. Honey bees, as excellent pollinators and producers of honey, bees wax, bee venom and polishing agents, are in high demand both nationally and internationally. 'Apiculture' is derived from Latin word i.e., Apis means bee and culture means rearing. So, Apiculture is a branch of agriculture in which bees are raised on a commercial scale for the production of honey and for use as pollinators to boost crop yields. It can be also defined as art and science of rearing and managing honey bees in a box called a 'bee hive' for the production of honey and other products such as propolis, royal jelly, beeswax, and bee venom. Beekeeping is an old tradition, but in most area it is considered a low-risk, high-reward venture. Honey

production is a profitable business that employs people. Beekeeping provides a lucrative livelihood for unemployed children as well as additional profits for farmers in rural areas. Honey bees are the only insects that collect large amounts of nectar, despite the fact that many insect species feed on it. Only two honey bee species, *Apis mellifera* L. and *Apis cerana* F., are domesticated worldwide. Honey has been consumed by humans for thousands of year and is most commonly consumed unprocessed (i.e., liquid, crystallized or in the comb). It can be taken as medicine, eaten as food, or used as a flavour enhancer in a variety of foods and beverages. Honey has been used to treat a variety of ailments for centuries in a variety of ways. Honey bees live in a matriarchal society, with a queen bee ruling over a colony of tens of thousands or even fifty thousand bees.

Kingdom: Animalia

Phylum: Arthropoda

Genus: Apis

Class: Insecta

Order: Hymenoptera

Family: Apidae

Methods:

1. Indigenous Method
2. Modern Method

Indigenous Method:

The old method commonly used by old apiculturists is very crude, cruel and of unplanned type. This old method is called as Indigenous Method.

Hive:

Two types of hives are used in indigenous method of bee keeping. (e.g) Wall or Fixed hive and movable hive.

A) Wall or Fixed Hives:

It is a purely natural type of comb because the bees themselves prepare the hive at any space on the wall or trees. There is an opening on one side through which bees come out of the hive.

B) Movable Hive:

It comprises of hollow wood logs, empty boxes and earthen pots etc. Placed in varandas of houses. There exist two holes, one is for entrance and the other for exit of the bees. The swarmed bees usually come to the box on their own accord. Some bee keepers use to take the clusters of the swarms from a tree and heat them in the hive.

Extraction:

In the Extraction process, the woods are filled with fire and it is bought near the hive. It is mainly conducted during the night times. once the fire is bought to the hives, bees will either fly or be killed. Then, the hive which is filled with honey will be eradicated, sliced into pieces and honey will be collected.

Drawbacks of Indigenous method:

- Honey becomes impure because at the time of squeezing, the brood cells, honey cells and larvae are also extracted.
- The colony becomes weak due to killing of the eggs and the larvae at the time of squeezing.
- Formation of new hive by the escaped bees requires extra energy which effects the yield.

Modern method:

To overcome the drawbacks of indigenous method an advanced method based on scientific fact has been developed. First of all care was taken to improve the texture of the hives and during this race hive patterns were introduced in India. The newton model with 7 to 10 frames in the brood chamber with the shallow super has been most popular in south, east and central India.

Flow Hives:

It is one of the most used and successful tools where the apiarists can harvest the honey easily. There is no need to open the hive and at any cause, the bees will not be disturbed.

Typical Movable Hives:

It is an artificial type of scientific bee keeping, completely made of a wooden box. Based on the needs the frames vary from one hive to another. It mainly consists of 6 parts. The stand is the base part of the hive, where the rain water can fall quickly. The inner cover provides 100% ventilation and the top cover protects the entire colony from rain water. On the bottom board, the presences of 2 gates are used of entrance and exit purposes. The brood chamber is the most vital part of the hive. totally there are about 5 to 10 frames. The wax sheets are integrated with the frames to attract the bees and provide the foundation for comb preparation on the dual sides.

Queen Excluder:

The queen bee is kept in the interior portion of the brood chamber and worker bees can easily pass through it.

Honey Extractor:

This one is mainly used to extract the honey and the functionality will be processed based on centrifugal force.

Uncapping Knife:

Once the honey is filled, the comb will be sealed by using wax material. Here, the sealing is completely eradicated with the aid of an uncapping knife. list of other equipments are cages, gloves, garments, brush, net and etc.

Robotization in agriculture:

- Robotization is another innovation in bee keeping that is transforming the industry by automating various labour-intensive tasks and providing precision management for bee hives.

- Robots and automated systems handled hive inspection for colony health monitoring, honey protection assessments, and pest or disease detection.

Points to consider for successful beekeeping

The following points should be taken into consideration for successful beekeeping.

Knowledge of bee habits

First, a thorough understanding of honey bee habits and behaviours is required. The queen honey bee, for example, is completely responsible for reproduction through mating and depositing eggs. Worker bees are responsible for collecting nectar, nursing larvae, and building the comb, among other things. The main aim of drones is to undertake mating.

Selection of suitable location

Suitable location should be selected for keeping beehives. Depending on the season, the hive is set up early in the morning to allow the bees to leave their hives earlier to go for collection of nectar. In hot climates, hives must be put in the shade to avoid being overheated. Bee farms can be established in areas where there is sufficient bee pastures of some wild shrubs, fruit orchards and cultivated crops. This plays an important role in the quantity and quality of the honey produced.

Management of beehives in different seasons

Flowering happens during specific seasons. Nectar is available to bees only in these periods. During other seasons, there is a scarcity of nectar due to limited blossoming. In such instances, beekeepers usually keep sugar syrup to meet the demand.

Proper collection of beeswax and handling of honey

Beekeepers must wear protective gear and use smoke to ward off bees while extracting honey and beeswax. They must also ensure that the hive has sufficient honey to harvest.

Catching and rearing of the honeybees

The natural colonies of bees can be captured or can be acquired from any government or private organisations for rearing.

Feed supplement and forage plants

Often sugar and bean flours are used as feed supplements to bees. Flowering plants are planted in apiaries as bee forage during dry periods.

Site clearing and sanitation materials

Sickles and machetes are needed for cutting grasses and weeds around the apiary. Grease, oil and wood ash should be spread around hive stands as insect guards.

Harvesting materials

Smokers' knife, honey press, honey container or trays are needed in case of harvesting from traditional and transitional hives and honey extractor and different sizes of sieves are needed in cases of harvesting from wooden framed hives.

Result

The number of worker bees in the colony, the race of bee, the age of the queen, the health of the colony, the flower density in the field, the nectar flow time, the number of colonies in the area, the climate and weather conditions are the factors affecting the honey production. It is very important to store the nectar that is carried into the hive by the honey bees without consuming it. Unsuitable hive condition and external environment condition increase the consumption of stored honey. Honey bees do thermoregulation in hives to hold the constant of the brood area temperature at 32-34degree Celcius. Honey bees consume honey to provide energy necessary for this. This reduces the amount of honey to be harvested from the hive. Traditional bee keeping is mostly made in wooden hives. This mean 34.89% less honey harvest compared to bee keeping made with modern method hives.

CONCLUSION:

For several years now, the EU has been providing support to the beekeeping sector through national apiculture programs and rural development measures considering environment for a sustainable agriculture in protecting bee health and improve biodiversity. As the European Food Safety Authority (EFSA, 2021) stated: "Bees are critically important in the environment, sustaining biodiversity by providing essential pollination for a wide range of crops and wild plants. They contribute to human health and wellbeing directly

through the production of honey and other food and feed supplies such as: pollen, wax for food processing, propolis in food technology, and royal jelly as a dietary supplement and ingredient in food. Beyond the essential value of pollination to maintaining biodiversity, the global annual monetary value of pollination has been estimated at hundreds of billions of euros. In view of the important ecological and economic value of bees, there is a need to monitor and maintain healthy bee stocks, not just locally or nationally but globally.” Moreover, due to the increasingly globalized food supply, strengthening food safety systems among countries is becoming more important. Nowadays, food safety is the consumer’s concern. Simple rules could control the disorders resulting from the consumption of honey and its products contaminated by microbial pathogens, toxic chemicals, or allergens, including avoiding crude honey consumption for susceptible people, buying honey from a reliable source, and avoiding feeding honey to infants less than 1-year-old.

Even if human studies provide outcomes related to the health effects, the origin and composition of bee products used were not specified as well as it was not possible to characterize them nor the specific components of bee products mediating the functions for which the claims were made consequently it’s difficult to establish the cause-and-effect relationship between healing effects and the consumption of honey and its products. The interesting healing properties highlighted in vitro and in vivo should be better understood and performed in more and well design randomized controlled trials to evaluating the effectiveness of honey and its products as therapeutic agents.

Abstract

The integration of Arduino technology in Agriculture has brought about a significant transformation in the way farming practices are conducted. This abstract examines the applications of Arduino in agriculture, focusing on its benefits, challenges and potential future development. This paper discusses the challenges such as cost, technical expertise and scalability, while also examining emerging trends and future prospects in the field. Arduino, a versatile open source platform, offers a cost effective and customisable solution for farmers in the field of sensor integration, automated irrigation systems, smart farming, crop monitoring, environmental sustainability in conclusion Arduino technology has the potential to revolutionize the agriculture sector by improving its efficiency productivity and sustainability and elucidates that transformative potential of Arduino technology in Agriculture and underscores the the important of further research and development to realise its full benefits for sustainable farming practices.

INTRODUCTION :-

An open source microcontroller called an Arduino maybe updated at any time and is simple to program. In 2005,the first Arduino was introduced. The Arduino microcontroller was created to help professionals and students create devices that interact with the environment using sensors .The Arduino microcontroller has inputs and outputs that maybe used to get information. The Arduino can then provide output based on the information it

has received. Using HTTP requests, Arduino microcontrollers are also capable of sending and receiving data online. The Esp board is a simple microcontroller with an internet connection. Esp microcontroller have two options: they may connect to a Wi-Fi server or take on the role of a Wi-Fi server.

Software and hardware make up the Arduino platform. The development board for Arduino is the hardware that it utilizes. The Arduino IDE is the name of the software used by Arduino to create code (Integrated Development Environment). These micro controllers may be readily programmed using the C or C++ language in the Arduino IDE and are equipped with either an 8-bit Atmel AVR or a 32-bit Atmel ARM micro controller, both of which are produced by Atmel.

When utilising a USB cable to upload fresh code to the Arduino board, another application for it is possible. With the help of the Arduino IDE, users may create programs for the Arduino platforms using the C or C++ programming languages on nearly any personal computer. The Arduino IDE is multiplatform software that can run on several platforms including Microsoft, Linux, and Mac OS X making the user community even larger.

Market vendors provide a wide variety of Arduino microcontroller boards. A little research is needed in order to use the appropriate Arduino board for the project. Each Arduino board offers unique features and characteristics. The use of Arduino microcontrollers opposed to other microcontroller with advantages for a variety of reasons.

Arduino Co – Founder Massimo Banzi mentioned some very important reasons to use Arduino boards (Louis, 2016).

1.Active User Community : Users of Arduino can submit a message and discuss their ideas. If you run into an issue when using the Arduino board, you may post it to a community site where other users will typically offer suggestion or solutions.

2.Growth of Arduino : Arduino microcontroller are less expensive than their competitors for newbies to get going to right away.

3.Inexpensive Hardware : The main website of the Arduino platform offers free usage.

4.Arduino Board as a Programmer.

DIFFERENT TYPES OF ARDUINO BOARDS :-

There are several different types of Arduino boards in the Arduino board family. Boards like the Arduino BT have a Bluetooth module built in for wireless connection. These built in modules can also be purchased separately and used in conjunction with it. Shield refers to these modules, a few of the well liked Arduino shield as shown in Figure 1.

Arduino Ethernet Shield : This shield allows an Arduino board to connect to the internet by Ethernet library and to read and write an SD card using the SD library.

- **Arduino Wireless Shield :** This shield allows the Arduino board to communicate wirelessly using Zigbee.

- **Arduino Motor Driver Shield :** This shield allows Arduino Boards to interface with the driver of a motor etc.

Elements of Arduino Boards : Elements of an Arduino Board can be done two categories:
a)Hardware

The Arduino micro controller consists of many components. Here are some of those main components and their functionality :

- i.Microcontroller :** This serves as the development board's central processing unit and may send and receive commands to any attached peripheral devices. Every board contains a different microcontroller, and they all have different specs.

- ii.External Power supply:** The Arduino microcontroller is powered by this power source using a DC voltage that ranges from 9 to 12 volts.

- iii.USB plug :** On the Arduino board, this connector is a key port. Using a USB cable, it is used to upload programs to microcontrollers. In the absence of an external power supply, the Arduino board is powered by DC voltage of 5volts from the USB connection

- iv.Internal Programmer.**

- v.Reset button.**

- vi.Analog pins:** These pins are used for analogue input and output. Analog pin counts differ from board to board as well.

- vii.Digital I/O Pins:** Digital input and output are handled by these pins. Additionally, each board has a different number of these digital pins.

- viii.Power and GND Pins :** The development board has pins that can pass 3.3 and 5 volts as well as ground via them.

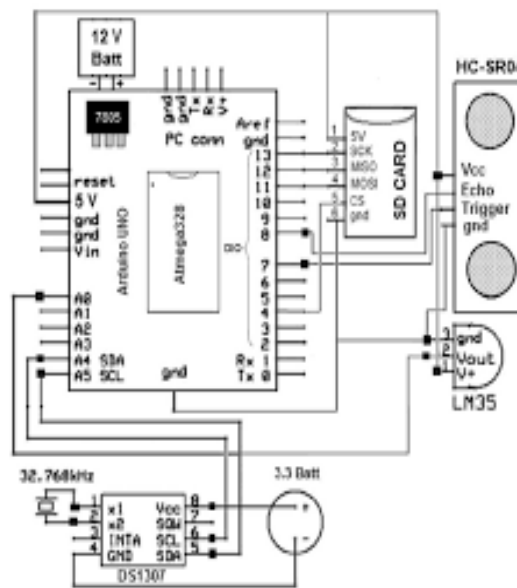

Fig 1. Arduino

1.Arduino coding basics:

The code is written in a simple programming language similar to C and C++.

i.Brackets

There are two types of brackets used in the Arduino coding, which are listed below.

ii.Parentheses ()

The parentheses brackets are the group of the arguments, such as method, function, or a code statement. These are also used to group the math equations.

iii.Curly Brackets { }

The statements in the code are enclosed in the curly brackets. We always require closed curly brackets to match the open curly bracket in the code or sketch.

Open curly bracket- '{'

Closed curly bracket - '}'

iv.Line comment

There are two types of line comments which are listed below:

//Single line comment

The text that is written after the two forward slashes are considered as a single line comment. The compiler ignores the code written after the two forward slashes. The

comment will not be displayed in the output. Such text is specified for a better understanding of the code for the explanation of any code statement.

The `//` (two forward slashes) are also used to ignore some extra lines of code without deleting it.

`/*Multi - line comment*/`

The Multi - line comment is written to group the information for clear understanding. It is commonly used to write the larger text. It is a comment, which is also ignored by the compiler.

v. Coding Screen

The coding screen is divided into two blocks. The setup is considered as the preparation block, while the loop is considered as the execution block. It is shown in figure 2:

Fig 2. Coding Screen of Arduino

The set of statements in the setup and loop blocks are enclosed with the curly brackets. We can write multiple statements depending on the coding requirements for a particular project.

1. **void setup ()**
2. **{**
3. Coding statement 1;
4. Coding statement 2;
5. **.**

6. .
7. .
8. Coding statement n;
9. }
10. **void** loop ()
11. {
12. Coding statement 1;
13. Coding statement 2;
14. .
15. .
16. .
17. Coding statement n;
18. }

vi.PinMode()

The specific pin number is set as the INPUT or OUTPUT in the pinMode () function.

The Syntax is: **pinMode (pin,mode)**

Where,

Pin: It is the pin number. We can select the pin number according to the requirements.

Mode: We can set the mode as INPUT or OUTPUT according to the corresponding pin number.

Let' understand the pinMode with an example.

vii.digitalWrite()

The digitalWrite() function is used to set the value of a pin as HIGH or LOW

Where,

HIGH: It sets the value of the voltage. For the 5V board, it will set the value of 5V, while for 3.3V, it will set the value of 3.3V.

LOW: It sets the value = 0 (GND)

If we do not set the pin Mode as OUTPUT, the LED may light dim.

The syntax is: **digitalWrite (pin, value HIGH/LOW)**

Arduino Syntax and Program Flow

2. Syntax

Syntax in Arduino signifies the rules need to be followed for the successful uploading of the Arduino program to the board. The syntax of Arduino is similar to the grammar in English. It means that the rules must be followed in order to compile and run our code successfully. If we break those rules, our computer program may compile and run, but with some bugs.

Functions:

The functions in Arduino combine many pieces of lines of code into one.

- A. The functions usually return a value after finishing execution. But here, the function does not return any value due to the presence of void.
- B. The setup and loop function have void keyword present in front of their function name.
- C. The multiple lines of code that a function encapsulates are written inside curly braces.
- D. Every closing curly bracket '}' must match the opening curly bracket '{' in the code.
- E. We can also write our own functions, which will be discussed later in this tutorial.

2.1 Spaces

- A. Arduino ignores the white spaces and tabs before the coding statements.
- B. The coding statements in the code are indented (empty spacing at the starting) for the easy reading.
- C. In the function definition, loop, and conditional statements, 1 indent = 2 spaces.
- D. The compiler of Arduino also ignores the spaces in the parentheses, commas, blank lines, etc.

2.2 Tools Tab

- A. The verify icon present on the tool tab only compiles the code. It is a quick method to check that whether the syntax of our program is correct or not.
- B. To compile, run, and upload the code to the board, we need to click on the Upload button.

2.3 Uses of Parentheses ()

- A. It denotes the function like void setup () and void loop ().
- B. The parameter's inputs to the function are enclosed within the parentheses.
- C. It is also used to change the order of operations in mathematical operations.

2.4 Semicolon ;

- A. It is the statement terminator in the C as well as C++.
- B. A statement is a command given to the Arduino, which instructs it to take some kind of action. Hence, the terminator is essential to signify the end of a statement.
- C. We can write one or more statements in a single line, but with semicolon indicating the end of each statement.
- D. The compiler will indicate an error if a semicolon is absent in any of the statements.
- E. It is recommended to write each statement with semicolon in a different line, which makes the code easier to read.
- F. We are not required to place a semicolon after the curly braces of the setup and loop function.
- G. Arduino processes each statement sequentially. It executes one statement at a time before moving to the next statement.

2.5 Program Flow

The program flow in Arduino is similar to the flowcharts. It represents the execution of a program in order.

We recommend to draw the flowchart before writing the code. It helps us to understand the concept of code. Which makes it the coding simple and easier.

2.6 Flow Charts

A flowchart uses shapes and arrows to represent the information or sequence of actions.

An oval ellipse shows the Start of the sequence \, and a square shows the action or processes that need to be performed.

The Arduino coding process in the form of the flowchart is shown below:

Here, the processor enters our code, and the execution of code begins. After the setup, the execution of the statement in the loop begins.

Example. Calculate RPM of wheel using Ultrasonic sensor through Arduino.

Result:

Fig 3. Arduino Ultrasonic Sensor with Buzzer

3. Arduino applications:

i.Smart homes: With Arduino boards, we may regulate household activities using control systems like motion sensors, outlet controls, temperature controls, blower controls, garage door controls, air flow controls, sprinkler controls, and bill of materials controls (David atal.,2015).

ii.Defence: An object's range, altitude, direction, or speed can be determined using RADAR (Radio Detection and Ranging), a technology that uses radio waves to detect things. Different sizes and performance requirements are possible for radars. It may be used for long-range surveillance, early-warning systems in ships, and air traffic control at airports. This system is the brain of a missile guidance system. In times of conflict, both large-room systems and a variety of compact, portable radars are maintained and controlled (Bhor et al.,2016).

iii.Industries: Because of its simple programming environment, variety of signal types, and ease of adaptability to new setups, Arduino is used in a wide range of industries. For adding remote control and monitoring features to tiny legacy industrial systems, Arduino boards provide a versatile, low-cost alternative to the typical industrial gadgets. The proliferation of Wi-Fi and other wireless technologies over the past few years has made wireless systems boring in our daily lives (Teja et al.,2017).

iv.Traffic Signal Control: Today, Arduino is used to control traffic lights. It may also be used to operate real-time systems with configurable timings and illumination for pedestrians , among other things. In a traffic control system, junction timing is automatically adjusted to facilitate smooth vehicle movement and prevent waiting at junctions.

v.Medical: The number of heartbeats in a minute is counted using an Arduino-based heartbeat monitor. This has an integrated heartbeat sensor module that detects the heartbeat when a finger is placed on the sensor. The open-source EEG,ECG, and EMG, the thermometer, the Wi-Fi body scale with Arduino Board, and many more pieces of medical equipment are designed using the Arduino platform (Rakay et al.,2015).

vi.Laboratories: Arduino offers a useful platform in the lab for developing and studying circuit design. Beginning users run the risk of breaking something or doing something incorrectly, and using new electronic components may be expensive for them. The Arduino Simulator provides a solution to these issues with no cable clutter, no hardware expense, faster circuit development, and no harm to your components. The automatic slide movement microscope built on Arduino is a relatively affordable lab tool (Rubio et al.,2015).

vii. Body Control with Arduino: Arduino can operate a variety of bodily parts, including hand Sigh gloves, breathalyzer microphones, heart rate monitors, and other medical devices. A heart rate monitor powered by Arduino is more sophisticated than one that only measures the user's heart rate. Our heart rate sensors are speaking! Each button verbally explains what it does while also displaying the data on the screen. This monitor will average the most recent four readings, show them, and provide some motivational sayings (Mallick and Patro, 2016).

viii. Aerospace: Classical control theory to an airplane flap model and integration of RC vehicles in a Robotic Arena (Alvarez et al.,2015).

ix. Automatic Vehicle Control: It is used to control various system in machinery like wheel speed, rpm, distance, torque, load etc(Alvarez et al.,2015).

Conclusion:

Successful development and control of five smart home apps using an Arduino platform and an Android smartphone. In a mock smart house, the apps regulate the temperature and humidity display, the fan speed, the lightning and electrical outlets, the fire alarm system, and the poisonous gas alert system. Following the purchase of the necessary parts for these systems, the wiring circuits and controllers were put into place. In a later study, Arduino components may be wirelessly linked to Arduino cell phones. Different controllers, including PLCs, might also be employed and studied.

EFFECT OF BIODEGRADABLE MULCH MATERIAL ON WEED CONTROL IN TOMATO PRODUCTION

Abirami. S, Akshaya. R , Durga Nandhini. A , Sarathi. S,

Department of agriculture engineering , paavai engineering college,namakkal, tamilnadu

Abstract

Biodegradable Mulching is one of the effective way of weed controlling and it is an alternative of black polyethylene (PE) mulch for all crops especially tomato crop (LIBERIAN VARIETY) the soil should be ploughed and levelled. The treatments were rice straw, , biodegradable coir mats, for effective weed controlling. Biodegradable coir mats and rice straw are potential substitutes for PE. Biodegradable mulch significantly reduces weed density, resulted in improving tomato plant growth and higher fruit yield compared to both the control and plastic mulch treatments. It regulates soil temperature and eventually decomposes, which in turn reduce environmental impact. It offers a promising solution for enhancing tomato crop yield through effective weed control. Its eco- friendly nature makes the environment sustainable.

Keywords

Control weeds, Improves plant growth, Increases yield, Protects from soil pollution, PE.

INTRODUCTION

Agricultural plastic mulching covering the soil provides cultivated plants with a microclimate favoring their development, hastening earliness, increasing productivity and enhancing fruit quality. Mulches increase water-use efficiency and prevent weed development (Gao et al., 2019; Kader et al., 2017; Kasirajan and Ngouajio, 2012). However, fragments released from massive use of low-density polyethylene (PE) plastic mulches, non-biodegradable, increasingly accumulate into the agricultural soil, polluting it and threatening crop productivity and food safety (Gao et al., 2019; Hu et al., 2020; Liu et al., 2014; Yan et al., 2014; Zhang et al., 2020). Biodegradable plastic mulches (BDM) are a promising alternative to PE mulches, intended to be tilled into the soil after the crop harvest

and eventually to biodegrade by native soil microorganisms, avoiding plastic waste accumulation into the field (Martin-Closas et al., 2017; Shen et al., 2020; Shruti and Kutralam-Muniasamy, 2019). Yet, the soil is continuously fed with BDM materials, fragments and chemicals (polymers, oligomers, monomers and additives), whose environmental impact is one of the main recently emerged concerns questioning BDM adoption in agriculture (Liu et al., 2022; Serrano- Ruiz et al., 2021; Shen et al., 2020; Sintim and Flury, 2017). Plants are the feed and food resource for living organisms, including humans. Cultivated plants interact with BDM and BDM debris from their initial setting on the soil up to their biodegradation in the field; consequently, their putative effects on mulched plant crops are to be investigated.

BIODEGRADABLE MULCHING

Mulch mats are circles of 100% natural coir, using the husks of the coconut. Made to fit all standard plant. Using lightly compressed coir, Coco & Coir mulch mats provide excellent plant base protection, whilst preventing water loss. By improving the fertility and health of the soil, garden mulching protects roots, improving the establishment and survival rates of new plants and trees. Coir mulch helps retain soil moisture and reduces weed growth by up to 90%. it also helps deter pesky slugs and snails because of its texture. As it slowly breaks down in the soil, it increases soil porosity, enriches it, and improves soil structure.

Coconut coir is a valuable mulch material. Because coconut coir retains moisture easily and naturally, it's very well-suited for use as a mulch. It will absorb water and release it into your garden to help keep your plants hydrated. Plus, as it slowly breaks down, it adds nutrients back into your soil as compost. This makes it more eco-friendly and advantageous than mulches that contain harmful plastics and chemicals.

METHODOLOGY

Biodegradable mulch film was considered to be a sustainable ecological alternative alleviate of plastic mulch film. Extensive studies related to biodegradable mulch film have been carried out in multiple perspectives. The research about biodegradable mulch film had developed from a field concentrated on material development to multi-disciplinary field with three main research knowledge bases: the necessity of degradable mulch film application, mulching on crop production and degradation process of biodegradable mulch film. we collect the materials like coir pith, paddy straw, manures, panjakavya, maida vinegar, cornflour ,tomato seedling and plastic mulch material The first process of mulch mat preparation-was to treat the coir pith with hot water for 5- 10min.Drain the hot water and take the coir pith separately. There it will soften the coir pith .Mix maida of 6 kg and cornflour of 4kg and treat it with hot boiled water untill it reaches the paste like consistency After the paste preparation mix 6 litres of vinegar with that paste. Thereby we have prepared the binding material for the mat.

Mix the coir pith along with the binding material and spread it evenly in plastic sheet After spreading cover the coir pith with another plastic sheet. Press the material evenly using wooden sticks. It will be transformed as an mat material . Then dry the materials on both sides in sunlight Plough the field into fine tilth . Apply manures in the field and plough again for good aeration and pulverization. After the manures application ridges are formed for the transplantation of seedlings. The ridges are formed at 40 cm height , 75cm width. The length of the organic mulch is 17 feet, plastic mulch is 19 feet and normal ridge without mulch is 15 feet.

Laying mulch mat- Separate the ridges and furrow into three portion. Apply paddy straw in 1 portion. Lay the biodegradable and non biodegradable (plastic) mulch material in two portions. Leave the rest of the portion as an normal field Transplantation of seedlings - Irrigate the field before transplanting. Transplant the 20- 25 days old tomato seedlings (Liberian variety). Slight irrigation is required after transplantation. Urea will be applied in plastic mulch material, panjakavya will be applied in biodegradable mulch material and urea for plastic mulch material. Both the mulch material will be compared along with the normal field for controlling. Monitoring and comparing the weed control from the beginning

on each three portions. While monitoring we can analyze the weed growth and estimate weed calculation.

MATERIALS AND ITS PROPERTIES

A. Coir pith and paddy straw

The largest by products of coconut is coconut husk from which coir fibre is extracted. This extraction process generates a large quantity of dusty material called coir dust or coir pith. Coir pith has gained importance owing to its properties for use as a growth medium in Horticulture. Coir pith is composted to reduce the wider C:N ratio, reduce the lignin and cellulose content and also to increase the manorial value of pith. Composting of coir pith reduces its bulkiness and converts plant nutrients to the available form. Rice straw is a residual byproduct of rice production at harvest. The total biomass of this residue depends on various factors such as varieties, soils and nutrient management and weather. At harvest, rice straw is piled or spread in the field depending on the harvesting methods, using stationary threshers or self-propelled combine harvesters, respectively. The amount of rice straw taken off the field depends mainly on the cutting height (i.e., height of the stubble left in the field). Rice straw that remains in the field after harvest can be collected, burned, or left to decompose (soil incorporation). Utilization of rice straw is dependent on its

characteristics, which can be divided into three major categories: (1) physical properties, (2) thermal properties, and (3) chemical composition.

B. Tomato seedling and manure

Tomato is one of the most important "protective foods" because of its special nutritive value. It is one of the most versatile vegetable with wide usage in Indian culinary tradition. Tomatoes are used for soup, salad, pickles, ketchup, puree, sauces and in many other ways. It is also used as a salad vegetable. Tomato has very few competitors in the value addition chain of processing. Manures are plant and animal wastes that are used as sources of plant nutrients. They release nutrients after their decomposition. The art of collecting and using wastes from animal, human and vegetable sources for improving crop productivity is as old as agriculture production. Manures are the organic materials derived from animal, human and plant residues which contain plant nutrients in complex organic forms. Naturally occurring or synthetic chemicals containing plant nutrients are called fertilizers. Manures with low nutrient content per unit quantity have longer residual effect besides improving soil physical properties compared to fertilizer with high nutrient content.

C. Maida and vinegar

Maida is a white flour from the Indian subcontinent, made from wheat. Finely milled without any bran, refined, and bleached, it closely resembles cake flour. Maida is used extensively for making fast foods, baked goods such as pastries, bread, several varieties of sweets, and traditional flatbreads. Owing to this wide variety of uses, it is sometimes labeled and marketed as "all-purpose flour", though it is different from American all-purpose flour. Maida is made from the endosperm: the starchy white part of the grain. The bran is separated from the germ and endosperm which is then refined by passing through a sieve of 80 mesh per inch (31 mesh per centimeter). Vinegar is a multipurpose substance and an essential component of many processes, including several in the agricultural sector. Specifically, agricultural vinegar, ranging from 10% to 50% concentrations, plays a significant role in a variety of applications. It's an environmentally friendly alternative to chemical pesticides and fungicides, aids in soil and water pH regulation, and even serves as a beneficial animal dietary supplement.

D. Cornflour and panchagavya

Corn flour is a type of flour milled from dried whole corn kernels. It's considered a whole grain flour because it contains the corn's hull, germ, and endosperm. Corn flour is usually yellow, but it can also be white or blue, depending on the variety of corn used. The texture is fine and smooth, similar to whole wheat flour. It controls the broad leaved weeds as well as grasses. Hence corn flour is recommended for transplanted crops only because it affects the root formation of germinating seeds since it has herbicidal activity. Panchagavya, an organic product has the potential to play the role of promoting growth and providing immunity in plant system. Panchagavya consists of nine products viz. cow dung, cow urine, milk, curd, jaggery, ghee, banana, Tender coconut and water. When suitably mixed and used, these have miraculous effects. Physico-chemical properties of Panchagavya revealed that they possess almost all the major nutrients, micro nutrients and growth hormones (IAA & GA) required for crop growth. Predominance of fermentative microorganisms like yeast and lactobacillus might be due to the combined effect of low pH, milk products and addition of jaggery/sugarcane juice as substrate for their growth.

E. Plastic mulch and urea

Plastic mulch is a product used in plasticulture in a similar fashion to mulch, to suppress weeds and conserve water in crop production and landscaping. Certain plastic mulches also act as a barrier to keep methyl bromide, both a powerful fumigant and ozone depleter, in the soil. Crops grow through slits or holes in thin plastic sheeting. Plastic mulch is often used in conjunction with drip irrigation. Some research has been done using different colors of mulch to affect crop growth. Use of plastic mulch is predominant in large-scale vegetable growing, with millions of acres cultivated under plastic mulch worldwide each year. Urea serves an important role in the metabolism of nitrogen-containing compounds by animals and is the main nitrogen-containing substance in the urine of mammals. It is a colorless, odorless solid, highly soluble in water, and practically non-toxic (LD50 is 15 g/kg for rats).[6] Dissolved in water, it is neither acidic nor alkaline. The body uses it in many processes, most notably nitrogen excretion. The liver forms it by combining two ammonia molecules (NH₃) with a carbon dioxide (CO₂) molecule in the urea cycle. Urea is widely used in fertilizers as a source of nitrogen (N) and is an important raw material for the chemical industry.

F. MULCH MAT PREPARATION

The first process of mulch mat preparation was to treat the coir pith with hot water for 5-10 minutes. Drain the hot water and take the coir pith separately. Thereby it will soften the coir pith. Mix 6kg maida and corn flour of 4kg and this is boiled until it reaches the paste like consistency. After the paste formation mix 3litres of vinegar in that paste. Thereby we have prepared the binding material for the mat. Mix the coir pith along with the binding material and spread it evenly in plastic sheet.

After spreading cover the coir pith with another plastic sheet. Press the materials evenly using wood sticks. It will be converted into mat material. The spread is dried into the direct sunlight. It required 2 days for drying the both the sides of the organic mulch mat. Now the mat is ready for laying.

FIGURE 1: COIR MAT PRETREATMENT

FIGURE 2: BINDING MATERIAL PREPARATION

FIGURE 3: COIR PITH MIXING WITH PASTE

FIGURE 4: DRYING THE MAT

CONCLUSION

In conclusion, the use of biodegradable organic mulch mats offers several benefits for gardeners and farmers. These mats help suppress weed growth, conserve moisture in the soil, and regulate soil temperature. They also break down over time, adding organic matter to the soil and reducing the need for chemical fertilizers. Additionally, the use of biodegradable mats eliminates the need for labor-intensive mulch removal at the end of the growing season. Overall, biodegradable organic mulch mats provide a sustainable and environmentally friendly alternative to traditional mulching methods.

HYDROPONICS TECHNOLOGY FOR HORTICULTURE CROPS

BALASRI. S, ABINAYA. R S, VENNILA. S, SHARUMATHI. M,

Students, Department of Agricultural engineering, Paavai engineering college.

ABSTRACT

The hydroponic Farming System is considered an alternative to conventional farming systems to reduce water requirements. The hydroponic farming system is beneficial, especially in areas with severe soil degradation and limited water availability. A soil-less production method, promises to deliver high quality, nutritious, fresh, residue-free crops, overcoming the problems of climate change, freshwater shortage, necessity of fertile land, and the overwhelming requirement of the expanding food demand. Hydroponic production systems are used by small farmers, hobbyists and commercial enterprises.

Keywords

Soil-less farming, less water usage by irrigation, low labor required.

INTRODUCTION:

Providing quality nutritive food to more than 1.6 billion people by the year 2025 would be a major challenge for the country. Increasing population, decreasing land and water holding, urbanization, industrialization, global warming are some of the major implements for the country. Various biotic and abiotic stress factors are threatening the open field agricultural production systems throughout the world in varying degrees. More than 6 million ha area has been affected by salinity and alkalinity apart from other factors continually degrading the soil health. Under these circumstances, it would become increasing by difficult to providing quality nutritive food for the burgeoning population in the near future. The demand for fresh and green horticulture produce, mainly vegetables, fruits and flowers, is rising sharply particularly in peri-urban and urban areas. Under such scenario, hydroponics system is emerging in potentially alternate technology for growing quality vegetables and flowers in various soil-less media under the limited space throughout the year. Although the technology is fledging stage in the country it is about time that seeds of initiatives are planted for timely technological adoption and its agro-ecological refinement

vis-à-vis our crops and climate, so that the pace of development is in tune with the needs of the nation, economic viability of production systems, health and safety of the consumers. The Government of India has been providing technical and financial support to the commercial initiatives related to hydroponics through National Horticulture Board (NHB) and National Horticulture Mission (NHM). Our institute is mandated to spearhead technological innovations in agricultural production system besides their outreach to all the stakeholders.

TYPES OF HYDROPONIC

There are several types of hydroponics systems, including:

- DEEP WATER CULTURE
- NUTRIENT FILM TECHNIQUE
- EBB AND FLOW (FLOOD AND DRAIN)
- WICKING SYSTEM
- AEROPONICS
- VERTICAL HYDROPONIC
- DRIP SYSTEM

DEEP WATER CULTURE:

Plants grow suspended in a nutrient solution, with their roots submerged in oxygenated water.

NUTRIENT FILM TECHNIQUE:

A thin film of nutrient solution flows over the roots of plants, providing them with water and nutrient.

EBB AND FLOW:

Plants are periodically flooded with nutrient solution and then drained, allowing the roots access to oxygen.

WICKING SYSTEM:

Nutrient solution is drawn up into the growing medium (like perlite or coconut coir) through a wick, providing water and nutrient to the plants.

AEROPONICS SYSTEM:

Roots are suspended in the air and misted with a nutrient solution, providing both water and oxygen directly to the roots.

VERTICAL HYDROPONICS:

Growing systems that utilizes vertical space, often with towers or shelves, to maximize growing area in limited space.

DRIP SYSTEM:

Nutrient solution is dripped onto the base of each plant, either directly onto the roots or onto a medium like rock wool or perlite.

ADVANTAGES OF HYDROPONICS:

- It can be used in places where in ground agriculture or gardening is not possible (for example, dry desert areas or cold climate regions).
- More complete control of nutrient, PH and growing environment.
- Lower water and nutrient costs associated with water and nutrient recycling.
- Faster growth due to more available oxygen in root area.
- Elimination or reduction of soil related insects, fungi and bacteria.

- No weeding or cultivation required.

DISADVANTAGES OF HYDROPONICS:

- Initial and operational costs are higher than soil culture.
- Skill and knowledge are needed to operate properly.
- Some diseases like Fusarium and Verticillium can quickly through the system.

However, many varieties resistant to the above diseases have been bred.

SUITABLE PLANTS:

While almost any plants can be grown hydroponically, some popular choices include lettuce, tomatoes, peppers, herbs and strawberries.

CHALLENGES:

INITIAL SETUP COST:

Setting up a hydroponic system can be more expensive than traditional gardening due to the cost of equipment and materials.

MAINTENANCE:

Hydroponic system require regular monitoring of nutrient levels, PH, and water quality to ensure optimal plant growth.

TECHNICAL KNOWLEDGE:

Some level of understanding of hydroponics principles is necessary to troubleshoot problems and maintain a healthy growing environment.

LIMITATIONS OF HYDROPONICS:

While hydroponics offers numerous advantages, it also has some limitations to consider:

INITIAL INVESTMENT:

Setting up a hydroponic system can be costly, especially for larger-scale operations. Expenses include equipment such as grow lights, pumps, reservoirs, and nutrient solutions.

TECHNICAL KNOWLEDGE:

Successful hydroponics gardening requires a good understanding of plants biology, nutrient management, PH levels, and hydroponic system maintenance. Beginners may face a learning curve.

SYSTEM FAILURE RISKS:

Hydroponic systems rely on pumps, timers and other mechanical components. If any part of the system fails, it can quickly impact plant health and crop yields.

POWER DEPENDENCY:

Many hydroponics setups required electricity to power pumps, lights and other components. Power outages or interruptions can disrupt the growing environment and affect plant growth.

DISEASE MANAGEMENT:

While soil-less growing can reduce the risk of soil-borne diseases, hydroponic system are still susceptible to pests fungi and bacterial infections. Proper sanitation and diseases prevention measures are essential.

NUTRIENT IMBALANCE:

Maintaining the correct balance of nutrients in the hydroponics solution is crucial for plant health. Imbalance can lead to nutrient deficiencies or toxicities, affecting plant growth and yield.

LIMITED CROP SELECTION:

While many plants can be grown hydroponically, some crops may not thrive in this environment. Certain root vegetables and large fruiting plants may be challenging to grow hydroponically due to their size or specific nutrient requirements.

WATER QUALITY CONCERNS:

Hydroponic system rely on water as the medium for delivering nutrients to plants. Poor water quality, including high levels of salts, chemical, or pathogens, can harm plants health and productivity.

CONCLUSION:

In recent years, hydroponics is seen as a promising strategy for growing different crops. To encourage commercial hydroponics farm, it is important to develop low cost hydroponics technologies that reduce dependence on human labor and lower overall startup and operational costs.

Hydroponics is currently a promising system to develop distinctive plants. Hydroponics is a strategy which can deal with anybody effortlessly.

ABSTRACT

This project aim is to provide a demonstration how fish and plant can be cultivated efficiently with minimal waste, space and maintenance. In this project, we have chosen clay pebbles as soilless mediums. With this medium different crop such, Tomato, Chilli, and two more leafy vegetable will be raised up. The crop yield will be analyzed with this medium on the basis of aquaponics. In principle the soilless medium is a substrate that is part of an artificial system of cultivation in which plants have grown without soil. Aquaponics emerged from multiple agriculture method that were seeking to provide a more environmentally sustainable means of food production. It has little market saturation and lack required attention to grow. It is a system of aquaculture in which the waste produced by farmed fish or other aquatic creatures supplies the nutrients for plants grown hydroponically which in turn purifies the water. It involving nitrifying bacteria for converting ammonia into nitrates.

Abstract

Nanotechnology emerged as gift to mankind with great potential in a broad variety of areas in research and everyday life. In contract to conventional biosensors results in a highly effective nanobiosensor with tiny shape. Nano biosensors is an electrochemical sensors that use the biological element as a diagnostic component and the electrode as a transducer. It refers to a system in which at least one of the nanostructure is used to detect gases, chemicals, biological agents, electric field lights, heat etc... The use of nanostructure in these systems is done to fill the gap between the convertor and the bioreceptor which is at the nanoscale. Biosensors may be used utilized in a number of agricultural applications such as assessing toxins in soils and crops.

ABSTRACT

Watering the plant is the most important cultural practice and one of the labor intensive tasks in daily greenhouse operation. Watering systems ease the burden of getting water to plants when they need it. Knowing when and how much to water is two important aspects of watering process. To make the gardener works easily, the automatic plant watering system is created. There have a various type using automatic watering system that are by using sprinkler system, tube, nozzles and other. This project uses Arduino board, which consists of ATmega328 Microcontroller. It is programmed in such a way that it will supply the water when required.

Keywords

Plant irrigation, Sprinkler Robot, Arduino, Water pump

INTRODUCTION

The objective of this project is to smart agricultural robot controlling system using android phone. The main scope of this project multipurpose system gives an advance method to plow minimum man power and labor making it an efficient vehicle using Bluetooth. In the modern society is now fully dependent upon technology and the technological approach has brought a revolutionary change in each and every field.

This project a multipurpose robot to be used in the battle field. This robotic vehicle is an agricultural machine of a considerable power and great soil clearing capacity. The machine will cultivate the farm by considering particular rows and specific column at fixed distance

depending on crop. Moreover the vehicle can be controlled through Bluetooth using an Android smart phone.

The main aim of agricultural robotics is apply robotics technologies on the field of agriculture as well as the agricultural challenges to develop new techniques. Now days, no one can end up the day without using any kind of embedded system products. It makes our human life very robust and makes work comfortable.

OBJECTIVES

- To Compare conventional Method of Irrigation With New Technology.
- To Make Robotic Model for Irrigation.
- To Supply Water Partially or totally for crops needed.
- To improve the Ground Storage.
- To Reduce the Manpower and Labor cost.

SUMMARY OF LITERATURE REVIEW

S. M. Wange et al., (2018) Presented the **“Automatic Water Sprinkler System”** is powered by solar energy. The solar energy is absorbed by the solar panel and the energy is stored as electricity in the battery. The battery gives power to the dc motor. Devutt et al., (2017) Presented the Plant Watering Robot **“Plant O Bot”** this robot is in manual operating system mode and finds any flower pot then its ultrasonic sensors help to find the height of flower pot and the robot adjusts the nozzle and gives 200- 400ml of water depending upon the size of pot. Saeid Jafari et al., (2013) presented the **“Towards an Automated Guided Vehicle(AGV)in Sprinkler”** the study to propose and develop an automatic guide vehicle (AGV) with the capability to change sprinklers timely and on appropriate positions for sprinkler irrigation classic method. The designed AGV is simulated on computer environment and the results show acceptable outcomes. Hema N et al., (2012) Presented the **“Plant Watering Autonomous Mobile Robot”** this fully automated watering system which uses wireless communication to communicate between the mobile robot and the sensing module. This gardening robot is completely portable and is equipped with Radio Frequency Identification module, a microcontroller, an on-board water reservoir and an attached water pump.

COLLECTION OF COMPONENTS

We collect the materials like

Arduino UNO, Battery, DC Motor, HC- 05 Bluetooth Module, Relay, Convertor, Water Pump, Sprinkler, Wheel, Water Tank And Connecting wires.

DC Motor-Apply the Voltage and the motor will start running in one direction; reverse the polarity and the direction will be reversed. It is DC gear motor with 45 rpm.

Battery-Battery is the power source for all components in machine. We are using 12V ,1.3Ah Lead Acid Battery.

Arduino UNO- It contain LED, micro- controller(ATMEGA328P) . It is the heart of the project work. It requires 5V DC power to Operate.

Keyboard-There are 4keys in the mobile remote for controlling the Irrigation Robot. The operation of the key is: Forward, Reverse, Left turn, Right turn.

Bluetooth module-It is popular and common used technology for sending data from one device to another device. It requires 5V DC power to operate.

Relay-The Relay permit the small amount of current to control high current load. It is used for ON and OFF the water pump.

Convertor- It is used to convert 12V to 5V for micro-controller and Bluetooth module. It supplies 12V power for water pump.

Water Pump-It is a submersible pump which can be operated using 12V power from battery. It is used to send water to sprinkler.

Sprinkler-It is used to Irrigate water similar to rainfall. It contains rotating nozzle joined with pipe and water motor.

Water Tank-Water tank is used to store water for irrigation. Capacity of the water tank is 3.5litres.

Wheels- Wheels are used for movement of the sprinkler machine.

DESIGN AND CALCULATION OF THE MODEL

Electrical power of the motor is defined by the following formula:

$$P_{in} = I * V$$

Output mechanical power of the motor could be calculated by using the following formula

$$P_{out} = T * \omega$$

Calculate angular speed if you know rotational speed of the motor in rpm:

$$\omega = N * 2\pi / 60$$

Efficiency of the motor is calculated as mechanical output power divided by electrical input power:

$$E = P_{out} / P_{in}$$

Therefore

$$P_{out} = P_{in} * E$$

After substitution we get

$$T * \omega = I * V * E$$

$$T * N * 2\pi / 60 = I * V * E$$

➤ TORQUE OF THE MOTOR:

Formula for calculating torque

$$T = \frac{I * V * E * 60}{N * 2\pi} = \frac{0.3 * 12 * 0.36 * 60}{100 * 2\pi}$$

$$\text{Torque} = 0.124 \text{ Nm}$$

WORKING OF THE MACHINE

Actually, this consists of a Rover which moves around and sprays pesticides, water etc. Initially the 12v battery is connected with dc motor and a 4channel relay. This 4-channel relay used for forward, backward, right, left motion of rover. And battery also connected with Arduino board, receiver and one channel relay. In Arduino Uno board all functions are programmed.

One channel relay used to on off the sprinkler which is placed at tank on the top of the rover. By filling pesticides or water in tank. Then sprinkler should turn on. It sprays. Then the rover motion controlled by mobile phone. It sprays wherever the signal is processed manually.

CONCLUSION

Thus, we have come up with a low-cost Plant Irrigation Water Sprinkler Robot. The project carried out by us made an impressive task in the field of Agricultural industries. It is very useful for water irrigation from streams or rivers. This project has also reduced the cost involved in the concern. Project has been designed to perform the entire requirement task, which has also been provided.

Abstract

Irradiation has recently emerged as possible alternative to currently used post harvest photo sanitary treatments research has also highlights other benefits associated with irradiation in post harvested technology. This review presents that effects and irradiation on post harvest and nutritional quality of tomatoes. The application of electric field rays irradiation of tomatoes is discussed including its effect on biological (respiration rate, ethylene production and microbial growth) physico – chemical (firmness, colour, total soluble solids and titratable acidity) and nutritional (vitamins, carbohydrates, anti oxidants) quality. Irradiated electrical rays treated tomatoes have shown resistance to microbial growth and decay. Although irradiation reduces the loss of vitamin C during storage, the loss of vitamin E remains a concern. Irradiated treatments lead to higher antioxidant capacity, flavonoids and phenolic content. The effect of harvest maturity and seasonal differences in the efficacy of Irradiation treatments is required to be investigated

Keywords

Tomatoes, Postharvest, Quality, electrical field rays, Irradiation.

Introduction

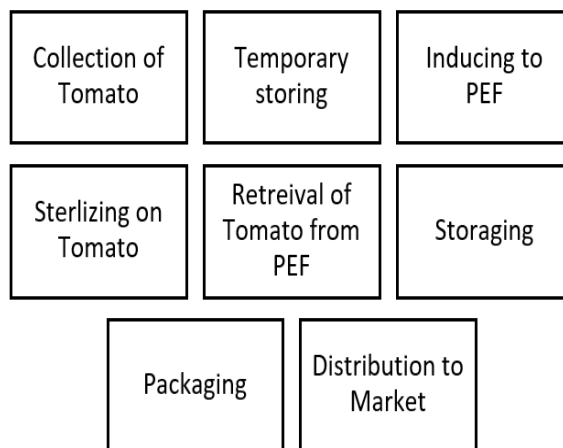

In the realm of food preservation, the quest for maintaining freshness while extending shelf life is a constant challenge. Tomatoes, with their delicate texture and susceptibility to spoilage, present a particularly demanding case. However, advancements in food

technology have introduced innovative methods to combat this issue, with irradiation emerging as a promising solution.

Irradiation, a process that utilizes ionizing radiation to eliminate harmful bacteria, insects, and pathogens, has gained traction as a safe and effective preservation technique. Unlike traditional methods such as canning or freezing, irradiation offers a non-thermal approach, preserving the nutritional integrity and natural flavour of tomatoes while extending their storage life.

This introduction will explore the principles of irradiation as a method for tomato preservation, delving into its benefits, safety considerations, and its potential to revolutionize the way we approach food preservation in the modern era.

Methodology :-

Material Collection :-

- Wooden frame
- Relay
- Driver Circuit
- Micro controller
- Pulsed Electric field
- Induction Transformer

Wooden Frame :-

Wooden Frame is relatively light in weight, yet has good strength in both tension and compression. And it provide rigidity and toughness and insulating properties. Wood doesn't conduct electricity.

Relay :-

Relays are electromagnetic switches that are commonly used in various applications to control electrical Relays provide electrical isolation between the control (coil) and the load (contacts).

This isolation helps protect the control circuit from the potentially higher voltage and current of the load circuit. Circuits by opening and closing contacts.

Relays are used in a wide range of applications, from simple home automation and lighting control to complex industrial automation, automotive systems, and safety interlocks.

Driver Circuit :-

Driver circuits, also known as driver amplifiers or simply drivers, are electronic circuits designed to interface between a low-power signal source (typically a microcontroller, logic device, or sensor) and a higher-power load (such as a transistor, motor, or LED).

Driver circuits have some protection features such as overcurrent protection, overvoltage protection, and thermal protection to prevent damage to the driver and load.

Micro controller :-

An 8-bit microcontroller is a type of microcontroller with an 8-bit data bus. Here are some key properties and characteristics of 8-bit microcontrollers.

The data bus of an 8-bit microcontroller is 8 bits wide, which means it can process data in 8-bit chunks at a time.

Pulsed Electric Field :-

Pulsed Electric Fields (PEF) is a technology that involves the application of short-duration, high-intensity electrical pulses to food, liquid, or biological materials.

PEF involves the application of intense electric field strengths, typically in the range of 200-300 volts or even higher.

Depending on the PEF system, the electric field can be applied in different directions, such as parallel plate, perpendicular, or coaxial, which can influence the treatment outcome.

Induction Transformer :-

An induction transformer is a type of electrical transformer that operates on the principle of electromagnetic induction. It consists of two or more coils wound around a common magnetic core. When an alternating current (AC) flows through one coil (the primary winding), it creates a varying magnetic field in the core.

This changing magnetic field induces a voltage in the other coil (the secondary winding) through electromagnetic induction. This property allows transformers to change voltage levels and is widely used in power distribution and electrical systems.

Design :-**Working Principle :-****Electroporation :-**

PEF creates transient pores in the cell membranes of the tomato tissue through a process called electroporation. The electric pulses cause the cell membranes to become permeable for a brief moment.

Technology Involved :-

- Irradiation technology
- PEF – Pulsed Electric Field rays
- Electroporation
- Sterilizing using PER(Pulsed Electric Rays)

Result & Discussion :-

Our paper's initial stage was centered around the design and fabrication of a Pulse electric field. Using techniques such as measuring, cutting and welding, we successfully created a model. Our subsequent step is to test the functionality of the Pulse electric field. We aim to observe its performance and efficiency, with the goal of developing a cost-effective and time-saving mechanism that perfectly kill the microbes present in tomato by using irradiation method. To evaluate the efficiency of the Pulse electric field we test tomatoes. From these results, the non irradiation method of tomatoes have shelf-life of 2 days where as irradiated tomatoes have shelf-life more than 5 days. This indicates that the Pulse electric field is significantly more efficient and productive compared to the non irradiation method. The use

of the Pulse electric field can help the farmers to reduce the post-harvest losses and improved results.

Conclusion :-

Irradiation had a significant impact on post-harvested practices in India. As a country that relies heavily on agriculture, India has faced many challenges during storage and transportation of tomatoes, including tomato degradation. Pulse Electric Field technology has helped to address these issues and improve the efficiency and productivity of post-harvested tomatoes in India. Our Pulse Electric Field technology in irradiation process can bring several advantages compared to non irradiated ones. Our Pulse Electric field can save time and increase efficiency. Additionally, it can help to increase the shelf-life of tomatoes. Overall, our Pulse Electric Field technology can lead to reduce post-harvest losses, cost savings, and increase shelf-life compared to non irradiation methods.

Abstract

The agricultural robot is used to reduce human efforts made by farmers during farming. There are many aspects to the future of this Agrobot. Agriculture is considered one of the most important economic activities in India. The bot uses various techniques that help us track the various activities involved in the farming process such as soil moisture level, soil type, different nutrient levels in the soil, suggestion of the crop to be cultivated. The multi functionality of the robot will also help the farmer use the same robot to extract weeds, maintain records on soil data, and make it available at any time as it will be stored in a cloud server. Farmers using bots will be easier to monitor the field. In recent years, robotics in agriculture sector with its implementation based on precision agriculture concept is the newly emerging technology. The main reason behind automation of farming processes are saving the time and energy required for performing repetitive farming tasks and increasing the productivity of yield by treating every crop individually using precision farming concept. Designing of such robots is modeled based on particular approach and certain considerations of agriculture environment in which it is going to work. These considerations and different approaches are discussed in this project. Also, prototype of an Agriculture Robot is presented which is specifically designed for seed sowing task only. It is a four wheeled vehicle which is controlled by switching. Its working is based on the precision agriculture which enables efficient seed sowing at optimal depth and at optimal distances between crops and their rows, specific for each crop type.

Keywords

Cloud Server, Precision Agriculture, Agrobot

Introduction

In the current generation most of the countries do not have sufficient skilled man power specifically in agricultural sector and it affects the growth of developing countries. So it's a time to automate the sector to overcome this problem. In India there are 70% people dependent on agriculture. So we need to study agriculture. Innovative idea of our project is to automate the process of ploughing and sowing seeding such as sunflower, corn, groundnut and vegetables like beans, lady's finger, pumpkin and seed of wheat etc.

The farmers are involved in agriculture practices, but proper automation in agriculture makes farmer work ease. There are various equipments that are moisture sensor, ph sensor and soil temperature sensor are implemented with automatic seed sowing machine. This machine helps a farmer in automatic seed sowing which reduces labor work.

Agricultural Robots or Agrobot is a robot deployed for doing agricultural purposes. Pollution is also a big problem. Which is eliminated by using solar panel. The energy needed for robotic machine is less as compared with other machines like tractors or any agriculture tools; also this energy is getting from the solar energy which is found abundantly in nature.

Nowadays robotics technology plays a paramount role in all Sections like medical field, industries and various organizations. In other countries robots are used to perform different operations in the agricultural field. The main application area of robots in agriculture is at the harvesting stage and Seed Sowing Stage. Driverless robots are designed to replace human labor. The Agrobot developed in this project performs ploughing, seed sowing and covering seeds simultaneously and powered by solar panel with a control by wiring. Every movement is controlled by DPDT switches connection.

Main Feature of Indian Agriculture

Agriculture is the main occupation. It provides employment to nearly 61% persons of total population. It contributes 25% to national income.

Agriculture in India mainly depends on monsoon. If monsoon is good, the production will be more and if monsoon is less than average then the crops fail. As irrigation facilities are quite inadequate, the agriculture depends on monsoon.

Due to increase in population the pressure on land holding increased. Land holdings get fragmented and subdivided and become uneconomical. Machinery and equipment cannot be used on such farms.

Due to increase in population the pressure on land holding increased. Land holdings get fragmented and subdivided and become uneconomical. Machinery and equipment cannot be used on such farms.

Due to large scale sub-division and fragmentation of holdings, land holding size is quite small. Average size of land holding was 2 to 3 hectares in India while in Australia it was 1993 hectares and in USA it was 158 hectares.

In India methods of production of crops along with equipment are traditional. It is due to poverty and illiteracy of people. Traditional technology is the main cause of low production.

In India methods of production of crops along with equipment are traditional. It is due to poverty and illiteracy of people. Traditional technology is the main cause of low production.

75% of the cultivated area is under food crops like Wheat, Rice and Bajra, while 25% of cultivated area is under commercial crops. This pattern is cause of backward agriculture.

Major Challenges faced by Indian Agriculture

Production of some of the major staple food crops like rice and wheat has been stagnating for quite some time. This is a situation which is worrying our agricultural scientists, planners and policy makers. If this trend continues, there would be a huge gap between the demand of ever growing population and the production.

Over the years rates of farm inputs have increased. Farm inputs include fertilizer, insecticide, pesticides, HYV seeds, farm labour cost etc. Such an increase puts low and medium land holding farmers at a disadvantage.

You can see the effect of globalization on the farm sector in India. All developing countries have been affected by it. The most evident effect is the squeeze on farmer's income and the threat to the viability of cultivation in India.

This is due to the rising input costs and falling output prices. This reflects the combination of reduced subsidy and protection to farmers.

Problem Statement

Agriculture is a very important sector in Indian economy. Most of the livelihood in India depends on agriculture. As the knowledge based farm labours are less, the requirement for them is high and their wages are increasing. Traditionally farming is done by human being with the help of bullock carts, tractors and tillers etc.

The main problem in agricultural field includes lack of labor availability, lack of knowledge regarding soil testing, increase in labor wages, wastage of seeds and more wastage in water. The idea of applying robotics technology in the field of agriculture is very new. In agriculture, the opportunity for robot-enhanced productivity is more and the robots are appearing on farms in various guises and in increasing numbers.

Problem Solution

In recent years there are many agricultural robots which can perform only single or dual tasks. We are improving the robot by designing a agricultural robot for spraying water, seeding, mulching and cutting operation. More than 42% of the total population in the world has chosen agriculture as their primary occupation. In recent years, the development of autonomous vehicles in agriculture rational and adaptable vehicles.

In the field of agricultural autonomous vehicles, a concept is being developed to investigate if multiple small autonomous machines are more efficient than traditional large tractors and human force. These vehicles should be capable of working round the clock all year round, in most weather conditions and have the intelligence embedded within them to behave sensibly in a semi-natural environment over long periods of time, unattended, while carrying out the useful task. There are a number of field operations that can be executed by autonomous vehicles, giving more benefits than conventional machines.

Existing System

Many agriculture operations are automated nowadays and many automatic machineries and robots available commercially. Some of the major operations in farming which are under research and automation are seeding, weeding and spraying processes. When it comes to designing a robot for automating these operations one has to decompose its idea into two considerations which are agriculture environment in which robot/system is going to work and precision requirement in the task over traditional methods. Based on this for seeding process, considerations which are taken into account in terms of environment are robot must be able to move in straightway properly on bumpy roads of farm field, soil moisture content may affect the soil digging function, sensors to be selected for the system must be chosen by considering farming environmental effects on their working.

Apart from these three other requirements are in terms of accuracy required in the task and these are: digging depth, particular optimal distances between rows and plants for certain type of crop, rows to be sown at a time and accurate navigation in the field. Whereas the other processes like weeding, spraying and harvesting, for which functioning depends on seeding stage by knowing the exact location of crop and then making those operations on it accordingly. So the major stage of all subsequent operations is maintaining a precision in seed sowing process.

When considering the physical aspects of the vehicle or robotic system, farmer's present condition in particular area plays a major role in designing these aspects. Considering facts of farming industry of India, system to be developed must have advantage over traditional methods and tractors in terms of cost, speed, accuracy in operation for which it is designed, fuel consumption and physical energy required by human for it. By targeting these issues and consideration properly the end product will be real help for farmers.

Interface by using Arduino board and various types of sensors. Various aspects shows Agricultural robot serves better result than manual system. It is expected that recent trends in robots shall make it to be used in enhanced role in future. In agriculture, Agricultural robot can be experienced for several advancements. Implementation of Agricultural robot has significant saving in terms of time, efficiency and saving the wastage of resources and reduced utilization of manpower should pay the cost once the system is activated. The scope of the system, especially in metro cities, is located in places where people are unaware of

farming. Agriculture is more valuable compared to others fields for occupation. The utility of technology with agriculture consider for automation. The Farming System is a suitable system which aids to sure that it has wide scope for improvement, which in turn eases the agricultural system for the farmers and ultimately helps in effective crop productivity.

Limitations

1. It costs a lot of money to make or buy robots.
2. They need maintenance to keep them running.
3. The farmers can lose their jobs.
4. The robots can change the culture / the emotional appeal of agriculture.
5. Energy cost and maintenance.
6. The high cost of research and development.
7. Lack of access to poor farmer.

Fabrication of Agrobot

In this fabrication process, have used certain materials and also different processes such as sawing, cutting, drilling and fastening are used. Most of the fabrication is done. Following figure 5.1 shows the end product of Agrobot.

The wood is cut into the desired dimensions to create the chassis. To mount the motors and T-shaped stand to the chassis, U-clamps, L-clamps are used and to fix these clamps fasteners are used. And for this purpose, holes are drilled at the measured locations on the chassis.

Slots are made in the chassis for the fixing of the seed distribution mechanism and also for the plough arm. For the seed distribution mechanism, a slot is made at the center of the chassis. For plough arm a slot is allocated on the chassis, along the shorter edge and the sides of the slot are made at equidistance from the central axis when drawn along the length of the chassis. A square cut is made at the centre of the plywood side. This cut is used to attach the plough arm to the chassis. The below table 5.1 shows the components used for making of agrobot.

Components Used for Agrobot

- Dc motors
- Battery
- Submersible pump
- Solar panel
- DPDT switches

DC Motor

A direct current (DC) motor is a type of electric machine that converts electrical energy into mechanical energy. DC motors take electrical power through direct current, and convert this energy into mechanical rotation. DC motors use magnetic fields that occur from the electrical currents generated, which powers the movement of a rotor fixed within the output shaft. The output torque and speed depends upon both the electrical input and the design of the motor.

A DC motor is composed of the following main parts:

- **Armature or Rotor:**

The armature of a DC motor is a cylinder of magnetic laminations that are insulated from one another. The armature is perpendicular to the axis of the cylinder. The armature is a rotating part that rotates on its axis and is separated from the field coil by an air gap.

- **Field Coil or Stator:**

A DC motor field coil is a non-moving part on which winding is wound to produce a magnetic field. This electro-magnet has a cylindrical cavity between its poles. Commutator and Brushes

- **Commutator:**

The commutator of a DC motor is a cylindrical structure that is made of copper segments stacked together but insulated from each other using mica. The primary function of a commutator is to supply electrical current to the armature winding.

- **Brushes:**

The brushes of a DC motor are made with graphite and carbon structure. These brushes conduct electric current from the external circuit to the rotating commutator. Hence, we come to understand that the commutator and the brush unit are concerned with transmitting the power from the static electrical circuit to the mechanically rotating region or the rotor. The conductors located on the other pole are subjected to a force of the same intensity but in the opposite direction. These two opposing forces create a torque that causes the motor armature to rotate.

Working Of Dc Motor

The term 'DC motor' is used to refer to any rotary electrical machine that converts direct current electrical energy into mechanical energy. DC motors can vary in size and power from small motors in toys and appliances to large mechanisms that power vehicles, pull elevators and hoists, and drive steel rolling mills.

DC motors include two key components: a stator and an armature. The stator is the stationary part of a motor, while the armature rotates. In a DC motor, the stator provides a rotating magnetic field that drives the armature to rotate.

A simple DC motor uses a stationary set of magnets in the stator, and a coil of wire with a current running through it to generate an electromagnetic field aligned with the centre of the coil. One or more windings of insulated wire are wrapped around the core of the motor to concentrate the magnetic field.

The windings of insulated wire are connected to a commutator (a rotary electrical switch), that applies an electrical current to the windings. The commutator allows each armature coil to be energized in turn, creating a steady rotating force (known as torque).

When the coils are turned on and off in sequence, a rotating magnetic field is created that interacts with the differing fields of the stationary magnets in the stator to create torque, which causes it to rotate. These key operating principles of DC motors allow them to convert

the electrical energy from direct current into mechanical energy through the rotating movement, which can then be used for the propulsion of objects.

Battery

A battery can be defined as; it is a combination of one or more electrochemical cells that are capable of converting stored chemical energy into electrical energy. Simply said that the battery is a storing device to store the energy.

In this project we are using a 12Volts battery for the running of coin based sensor mobile charging project. The capacity of this battery is 12V 1.4 AH

Submersible Pump

A submersible pump, also called an electric submersible pump, is a pump that can be fully submerged in water. The motor is hermetically sealed and close-coupled to the body of the pump. A submersible pump pushes water to the surface by converting rotary energy into kinetic energy into pressure energy. Below figure 5.12 shows the submersible pump.

Listed below are some common submersible pumps:

- Bladder Pumps.
- Grinder Pumps.
- Well Pumps.
- Borehole Pumps.
- Fountain Pumps.
- Utility Pumps.

Submersible pumps are often used to pump excess water from work sites or flooded basements in construction sites. They can also be used to pump slurries. Submersible pumps

can be used in inland or offshore oil wells to pump oil from the ground to treatment and holding facilities above ground.

Solar Panel

Solar panels are those devices which are used to absorb the sun's rays and convert them into electricity or heat. A solar panel is actually a collection of solar (or photovoltaic) cells, which can be used to generate electricity through photovoltaic effect.

These cells are arranged in a grid-like pattern on the surface of solar panels. Thus, it may also be described as a set of photovoltaic modules, mounted on a structure supporting it. A photovoltaic (PV) module is a packaged and connected assembly of 6×10 solar cells. When it comes to wear-and-tear, these panels are very hardy. Solar panels wear out extremely slow. In a year, their effectiveness decreases only about one to two per cent (at times, even lesser).

Most solar panels are made up using crystalline silicon solar cells. Installation of solar panels in homes helps in combating the harmful emissions of greenhouse gases and thus helps reduce global warming. Solar panels do not lead to any form of pollution and are clean. They also decrease our reliance on fossil fuels (which are limited) and traditional power sources. These days, solar panels are used in wide-ranging electronic equipment like calculators, which work as long as sunlight is available. However, the only major drawback of solar panels is that they are quite costly. Also, solar panels are installed outdoors as they need sunlight to get charged. Below figure 5.13 shows the solar panel used in our Agrobot.

Switches

Switch is an electrical component which can make or break electrical circuit automatically or manually. Switch is mainly works with ON (open) and OFF (closed) mechanism. Numerous circuits hold switches that control how the circuit works or actuate different characteristics of the circuit. The classification of switches depends on the connection they make. Two vital components that confirm what sorts of connections a switch makes are pole and throw.

- **Pole:**

The amount of circuits controlled by the switch is indicated by poles. Single pole (SP) switch controls only one electrical circuit. Double pole (DP) switch controls two independent circuits.

- **Throw:**

The number of throws indicates how many different output connections every switch pole can connect its input. A single throw (ST) switch is a simple on/off switch. When the switch is ON, the two terminals of switch are connected and current flows between them. When the switch is OFF the terminals are not connected, so current does not flow. These are classified on based the connections they make. If you were under the impression that switches simply turn circuits on and off, guess again.

Preparation of Chasis

1. The chassis is made with wood of dimensions of 400*300*12 millimetres length, width and thickness respectively.
2. This agriculture robot having four wheels for the movement purpose. we have used U clamps to hold the motors to the chassis to which the wheels are attached.
3. The wheels are made of plastic and has the diameter of 70 mm, thickness of 22.5 mm.
4. The placing of each motor to the chassis has specific location. The dimensions of motor placing from each corner is 50*10 millimetres length and width respectively.
5. The motors are used to rotate the wheels are of 12v, 60 rpm type.
6. Wires of required length are soldered to the motors. On the left side both motors are attached to the battery in parallel connection.
7. Similarly, the motors are connected in parallel connection on the right side.
8. A 300*50 millimetres size wood is added at the front of the chassis and is fixed to the chassis using screws. L-clamps are also used to provide extra support.
9. A wooden strip of dimensions 300*45 mm is fixed to front end of chassis to this an L.E.D strip is attached. These lights help the user to navigate the agrobot even in the dark.

Seeding Arrangement

1. A cut is made in the chassis for the seeding operation. This cut is of dimensions 150*50 millimetres as length and width respectively. The below figure 5.19 shows the cutting of chassis for the pet bottle arrangement.

2. A P.E.T bottle is used for the seeding purpose. Some holes are made in the P.E.T bottle for the seeds to fall out, at certain distance from each other.

3. 9V, 45r.p.m motor is used for the seeding purpose. whenever the motor rotates the bottle also gets rotated. With every one complete rotation made by the bottle, the seeds will fall out through the holes.

4. 5 holes are made in the P.E.T bottle along its length. These holes are made 20 mm away from each other with equidistance. This causes the seeds to fall out at their designated points.

5. On the other side a hole is made at the base center of the bottle. A shaft is inserted in this hole. This shaft supports the bottle and also allows it to freely rotate. Below figure 5.20 shows the complete seeding arrangement in the agrobot.

Working Principle

Four DC motors are used for driving the four wheels of vehicle. These four motors gives the directions like forward, backward, left and right For these directions of movements we used two DPDT switches. If we have press two switches at a time front side, then the robot will move forward. If we have to press two switches at a time back side, then the robot will move backward direction. If we have to press one switch is front side and another switch is back it will make a turn. If you do not press any switch the robot should be in stable condition. V-shaped arms for Agrobot are used, closing of which will dig the soil and opening of it will release the soil to cover the pit. DC motors of arms and wheels are directly connected to DPDT switches to enable them rotating in both clockwise and anticlockwise direction. A single DC motor is required for the movement of V-shaped arms as ploughing. The movement of the ploughing motor is also operated by another DPDT switch. Seed tank and water tank are connected for storage of seeds and water respectively. A DC motor is connected for rotating wheel mechanism to drop the seeds. Submersible entirely waterproof DC water pump is used for pouring the water.one more DPDT switch is required for performing both seeding and watering operations. Input of crop type is given manually by

selecting one of the four input switches. We are using an X principle while connecting the DPDT switch. This principle gives the both directions to the motors when we are using throwing two directions.

Operations performed by Agrobot

The ploughing tool can be operated in three modes namely on, off and mid. The microcontroller will receive the command to work on any of these three modes and it directs the plugging tool to plough the field accordingly.

The seeds are stored in a small container and it is closed with a small flip. This flip is controlled by the motor to open and close the container. The motor is capable of rotating to 360 degrees.

During summer there is shortage of water due to the scarcity if rain and frequent power cuts, so a smart method to pump water is described as follows. A water container is used for water storage. A water pump is used for pumping water to the water sprayer. The water flows to the sprayer through pipe. The power for pump is regulated by using a relay switch.

Conclusion

An autonomous robot is developed to perform the complex farming task of seeding. Agrobot in this project is designed to perform sowing only for four crops: cotton, maize, soybean, wheat. Row and column distances required for these four crop types are modeled in the system. With slight variations of few centimeters in the distances defined robot successfully covers distances between crops and their rows.

Navigation technique using IR sensors in Agrobot is easier and less bulky over other existing agriculture robotic systems. Ease of handling and precision working makes this agriculture robot real aid for farmers. Less complexity in the mechanical design and simpler navigation technique makes the system of lower cost and less bulky compared to conventional tractors. Also, the coverage area by the robot is restricted because of its dependence on DC battery. Other crop types can be included by modeling their required optimal distances.

In future, the system can be modified for other farming tasks too such as weeding and spraying processes with some mechanical designing modifications and by using advanced

controllers and sensors. More advanced and fast system can be developed with more focus on implementation of right mechanical parts and their designing.

MILLET BROWNIE AN APPROACH TOWARDS TRIPLE BURDEN OF MALNUTRITION

Ganeshwari. R,

Assitant Professor, Department of Agricultural Engineering, RVS Technical Campus, Coimbatore, Tamil Nadu, India.

Pragadeeshwari. U, Dhiviya. S, Magdhalenaa Stephaniya. S,

Students, Department of Agricultural Engineering, RVS Technical Campus, Coimbatore, Tamil Nadu, India.

Abstract

A millet-based approach toward addressing the triple burden of malnutrition holds promise in promoting food security, improving dietary diversity, and enhancing nutritional outcomes across diverse populations. Incorporating millet into innovative recipes like millet brownies can play a pivotal role in advancing nutrition-sensitive interventions and fostering sustainable food systems. The triple burden of malnutrition refers to the coexistence of undernutrition, micronutrient deficiencies, and overnutrition (including overweight and obesity) within populations, households, and individuals. Addressing this complex challenge requires comprehensive approaches that emphasize the availability, accessibility, and affordability of nutritious foods. This study focused on developing a product to combat micronutrient deficiencies often overlooked in mainstream nutritional studies, which primarily concentrate on calorie intake. The research involved the development, sensory evaluation, nutrient analysis, and shelf life of millet-based brownies as a supplement for calcium deficiency, a prevalent micronutrient deficiency. Finger Millet (Ragi) and foxtail millet were chosen to create a calcium-rich product due to their nutritional richness in calcium, vitamin B12, cardiovascular health benefits, breast cancer prevention, and ecological sustainability, coupled with their climate resilience. Three variations of millet based brownies were created, and the product approved by sensory panels underwent further nutrient analysis. The millet brownie development process was simplified and made cost-effective to facilitate smooth adoption and achieve desired outcomes. The nutrient profile of the millet brownie, including carbohydrates (62.9g), energy (400 kcal), protein

(5.5g), calcium (197mg), and fiber (4.6g), was analyzed. This study represents a fruitful endeavor toward developing a product suitable for addressing micronutrient deficiencies through intervention strategies.

Keywords

Triple burden of malnutrition, millet brownie, nutrient analysis, shelf life.

TRADITIONAL AND MODERN TECHNIQUES IN FOOD PRESERVATION

ABSTRACT

In Order to store the foodstuffs for a long period of time without any spoilage , proper preservation is needed. However preservative materials must not be causes toxic to human. There are some techniques to eliminate microbial contamination and avoid rancidity of fat present in preservative materials. Care must also be taken to preserve nutritional value, texture, odour, structure, taste, smell and flavour of foodstuffs. In this traditional techniques for preservation such as curing, freezing, canning, boiling, pickling and many more as well as modern techniques such as pasteurization, freeze drying, vacuum packing, irradiation, bio preservation, hurdle technology and modified atmosphere are briefly discussed. This techniques are particularly popular for preserving meats, fruits & vegetables offering convenience and efficiency in foodstuffs storage.

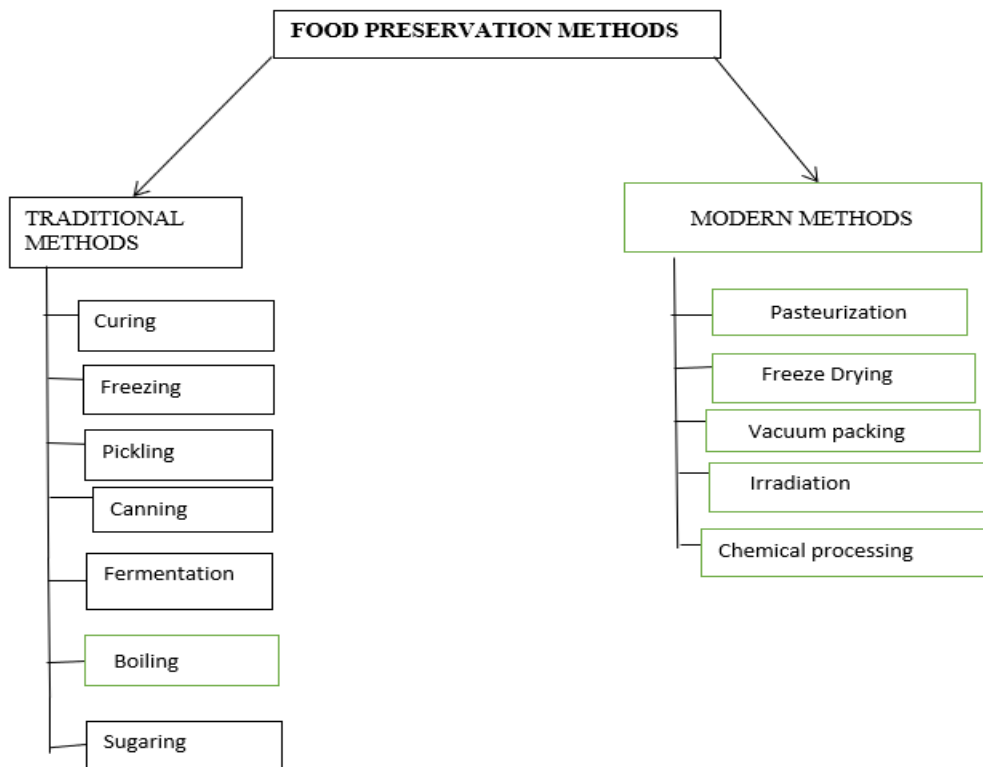

KEYWORDS

Pickling, Canning, Sugaring, Fermentation, Freeze Drying, Vacuum Packing, Bio preservation.

Introduction

Food preservation is the process of handling and treating food to control its spoilage by stopping the attack and growth of food-borne disease-causing microbes; avoiding oxidation of fats (rancidity); and maintaining the nutritional value, texture, and flavour of the food. Food preservation is also known as food processing. (Lianou, Panagou, & Nychas, 2016; Necidová et al., 2019). It is commonly recognized that chemicals, bacteria from the

surrounding area, and enzymes included in the food itself can cause food products to decay if they are exposed to them. In addition, food and food products must be carried from one location to another to be consumed. During transit, there are chances to deteriorate the food, loss or decrease in morphological attraction, and reduction in the nutritional value of the food. According to the World Health Organization (WHO), around 600 million people – roughly one out of every ten people on the earth – become unwell after eating contaminated food, and 420 000 people die each year, resulting in the loss of 33 million healthy lifestyles. Similarly, 2.2 million children in poorer countries die of diarrhoea each year[2018 food-borne disease outbreaks]. Inadequate sanitation, a lack of drinkable drinking water, insufficient food storage facilities, and food safety awareness make food-borne disease outbreaks in underdeveloped countries. It is the leading cause of morbidity and mortality all across the world. In many regions of the world, food-borne outbreaks caused by tainted food are becoming more widespread. Therefore, it is important to make efforts for food preservation for longer shelf life, stability in quality, maintaining the morphological attraction, and no change in taste (Sharif, Mustapha, Jai, Yusof, & Zaki, 2017). Various foods have been gathered and processed all around the world over time. Every year, there is also food rotting and many ripening food effects. Today, several approaches are applied to extend its shelf life. Several traditional and modern ways now operate. However, current methods are increasingly preferred over conventional methods due to their greater efficiency and dependability. (Annis & Banks, 1993). With the flow of time, several modern methods have also been developed to protect different types of food for varying lengths of time. While some processes have certain drawbacks, others have advantages that are being displaced by other methods, allowing us to store our food articles for longer periods without losing their flavour, nutritional value, quality, aroma, taste, or freshness; some processes have advantages that are being replaced by other techniques. Numerous approaches have been evaluated that,

Traditional methods for food preservation

The following are the main traditional methods for preservation of foods:

Curing

The basic concept in curing of foods like meat, fishes and vegetables is to reduce the moisture contents by osmosis process. When moisture contents in any food are much low, there are much lesser chances of getting microbial infection and subsequently growth. Curing is also done for flavouring. It is done by adding salt, nitrates, sugar, nitrites in combinations which are capable of dehydrating the food. Higher salt used for curing also dehydrates bacteria resulting in their killing. Not only this, salt is also capable of slowing oxidation process resulting in slow oxidation of fat thus avoiding rancidity (https://en.wikipedia.org/wiki/Food_preservation).

Freezing

Freezing is a phase transition where a liquid turns into a solid when its temperature is lowered below its freezing point. In accordance with the internationally established definition, freezing means the solidification phase change of a liquid or the liquid content of a substance, usually due to cooling.

For most substances, the melting and freezing points are the same temperature; however, certain substances possess differing solid-liquid transition temperatures. For example, agar displays a hysteresis in its melting point and freezing point. It melts at 85 °C (185 °F) and solidifies from 32 °C to 40 °C (89.6 °F to 104 °F).

Freezing the food at temperatures ranging from minus 10o C to minus 80o C for long term storage is much DOI: 10.31080/ASNH.2019.03.0529 Citation: Anil Kumar. "Food Preservation: Traditional and Modern Techniques". Act a Scientific Nutritional Health 3.12 (2019): 45-49. 46 Food Preservation: Traditional and Modern Techniques common technique at the commercial scale as well as at homes. Under the freezing condition, microbes generally do not survive, and if any already existing microbe survived, it will not multiply. The phenomenon of meat freezing is very quick, and nearly 75% of tissue fluid freezes at -5 °C. While the temperature is decreased, the freezing rate is increased, and around 98% of water freezes at -20 °C. However, widespread crystal formation occurs at -65 °C (Dave & Ghaly, 2011; Rosmini, Perez-Alvarez, & Fernandez-Lopez, 2004)

Table No.1 Different quick-freezing techniques (fishery products) (Venugopal, 2005).

Criteria	Contact freezing	Plate freezing	Air-blast freezing	Cryogenic freezing
Capital cost	Low capital investment		Economical to construct and operate	High capital costs
Operating cost	Low operating cost		Higher operating cost	Higher operating cost
Heat transfer	Controlled heat transfer	heat	Efficient heat transfer	Efficient heat transfer
Product line	Generally bulk freezing	bulk	Flexible	Flexible
Required floor space	Large		Large	Small
Refrigeration plant	Required		Required	Not required
Maintenance cost	Low		Low	Minimum
Dehydration loss	High		High	Minimum
Product quality	Reasonably good product quality	good product quality	Good product quality	Superior product quality

Pickling

This technique involves adding acid, such as vinegar or lemon juice, to food, and optionally adding sugar, salt, spices, or herbs for flavor. Pickling lowers the pH of food, making it more acidic and less hospitable for microorganisms and enzymes. Pickling also enhances the flavor and texture of food, and may prevent oxidation and browning. Examples of pickled foods include cucumbers, onions, peppers, carrots, beets, eggs, and herring. Pickling can be done quickly, such as by immersing food in hot vinegar, or slowly, such as by fermenting food in brine. Pickling preserves the water and fiber content of food, but it

also reduces the vitamin and mineral content, especially vitamin C. Pickling can also alter the color and appearance of food, and may require refrigeration or sterilization to prevent spoilage.

Canning

The food contents are sealed in an airtight container at high temperatures. Meat, fish, fruits are preserved by canning. The process of canning for extending the shelf life of foodstuffs was discovered by Nicolas Appert, a French confectioner in early nineteenth century. The process involves cooking of the food, and thereafter sealing it in sterilized jars or cans, and boiling the containers for sterilization. Under the conditions, there is killing or weakening of any remaining microbe. The process could not be popular until 1864 when Louis Pasteur showed the relationship between the food spoilage and microbes, and subsequently illness [https://nchfp.uga.edu/publications/nchfp/factsheets/food_pres_his t.html].. This microbe also produces a toxin, however unlike toxin produced by *Clostridium botulinum*, this is not inactivated by heating the canned food (<https://en.wikipedia.org/wiki/Canning>).

Fermentation

Certain foodstuffs such as beer, wine and cheese are manufactured by the process of fermentation using specific microbes. These fermentative microbes protect the foodstuff against other pathogenic microbes by producing an acid or alcohol which is toxic to other pathogenic microbes. During fermentation, controlled conditions such as salt, temperature, oxygen level and other parameters are maintained which help the fermentative microbe to produce the food product good enough for human consumption. [https://en.wikipedia.org/wiki/Fermentation_in_food_processing].

Boiling

It is a traditional way especially in developing countries to boil water in order to kill microbes if any in it, and thereafter, it is cooled to room temperature before drinking. It is also customary to boil milk before drinking (even pasteurized milk) in order to kill the microbes if any.

Sugaring

It is customary even today to preserve certain food-stuffs using sugar as a preservative. The basic mode of action is that high sugar contents make the foodstuff hyper tonic and microbes do not survive in hyper tonic solution since hyper-tonic solution will draw water from the microbe and it will be-come dehydrated. It is quite common to store fruits in honey or sugar. Jams and jellies are also examples of sugaring. Many soft drinks concentrates like orange squash which have much sugar amount are also prepared based on this principle.

Modern methods for food preservation

Pasteurization

Pasteurization is the technique of killing pathogenic bacteria, inactivating spoilage-causing enzymes, and reducing or eliminating rotting microorganisms in food by employing heat. The comparatively modest heat treatment employed in the pasteurization process causes little alterations in the sensory and nutritional characteristics of foods when compared to the high heat treatments utilized in the sterilization process. The temperature and time requirements of the pasteurization process are influenced by the pH of the food. Pasteurization primarily targets spoilage bacteria and enzymes when the pH . Pasteurization is a process for preservation of liquid food. It was originally applied to combat the souring of young local wines. Today, the process is mainly applied to dairy products. In this method, milk is heated at about 70 °C (158 °F) for 15–30 seconds to kill the bacteria present in it and cooling it quickly to 10 °C (50 °F) to prevent the remaining bacteria from growing. The milk

is then stored in sterilized bottles or pouches in cold places. This method was invented by Louis Pasteur, a French chemist, in 1862.

Freeze drying

Freeze drying, also known as lyophilization or cryodesiccation, is a low temperature dehydration process that involves freezing the product and lowering pressure, thereby removing the ice by sublimation. This is in contrast to dehydration by most conventional methods that evaporate water using heat. Because of the low temperature used in processing, the rehydrated product retains much of its original qualities. When solid objects like strawberries are freeze dried the original shape of the product is maintained. If the product to be dried is a liquid, as often seen in pharmaceutical applications, the properties of the final product are optimized by the combination of excipients (i.e., inactive ingredients). Primary applications of freeze drying include biological (e.g., bacteria and yeasts), biomedical (e.g., surgical transplants), food processing (e.g., coffee), and preservation.

Vacuum packing

Vacuum-packing stores food in a vacuum environment, usually in an air-tight bag or bottle. The vacuum environment strips bacteria of oxygen needed for survival. Vacuum-packing is commonly used for storing nuts to reduce loss of flavor from oxidization. A major drawback to vacuum packaging, at the consumer level, is that vacuum sealing can deform contents and rob certain foods, such as cheese, of its flavor. The earliest study of vacuum cooling of cooked meat was perhaps conducted by Burfoot, Self, Hudson, Wilkins, and James (1990), who observed that vacuum cooling greatly increased cooling rate of boneless hams in comparison to convection cooling. James (1990) showed that vacuum cooling of large hams (6.8–7.3 kg) from 70 to 10 °C only took 0.5 h as compared to 10 h using air blast chilling. However, no further research attempts were made. In 1997, the Food Refrigeration and Computerised Food.

Irradiation

Irradiation is the process by which an object is exposed to radiation. An irradiator is a device used to expose an object to radiation, notably gamma radiation, for a variety of purposes. Irradiators may be used for sterilizing medical and pharmaceutical supplies, preserving foodstuffs, alteration of gemstone colors, studying radiation effects, eradicating insects through sterile male release programs, or calibrating thermoluminescent dosimeters (TLDs). The exposure can originate from various sources, including natural sources. Most frequently the term refers to ionizing radiation, and to a level of radiation that will serve a specific purpose, rather than radiation exposure to normal levels of background radiation. The term irradiation usually excludes the exposure to non-ionizing radiation, such as infrared, visible light, microwaves from cellular phones or electromagnetic waves emitted

by radio and television receivers and power supplies. The irradiation results in the inactivation of organisms found in frozen food. When eliminating pathogenic microorganisms, Gamma radiation and x-rays are both effective methods. The gamma sterilization procedure uses cobalt 60 radiation to kill microorganisms. (Ronholm et al., 2016). A certain concentration of these radiations is needed for efficient.

Chemical Preservation

Chemical food preservatives are compounds that, underneath specific environments, also inhibit the growth of germs without essentially killing them or preventing quality degradation during production and distribution. Some natural dietary elements that, when added to foods, impede or prevent the growth of microbes are included in the first group. Sugar is used in the preparation of jams, jellies, and marmalades, as well as in the candying of fruit. This includes the use of vinegar and salt in pickling, as well as the use of alcohol in brandying. To prevent the growth of microbes, some chemicals that are not found in foods are added. The latter group includes some natural food elements, such as ascorbic acid, which is added to frozen peaches to prevent browning, as well as a wide range of artificial chemicals.

Conclusion

Both traditional and modern preservation methods have their own advantages and disadvantages, and the choice of which method is better depends on various factors such as the type of food being preserved, available resources, and personal preferences.

Traditional preservation methods, such as canning, drying, smoking, and fermenting, have been used for centuries and are often preferred for their simplicity and natural ingredients. These methods can enhance the flavor of food and allow it to be stored for long periods without the need for refrigeration or other modern conveniences. However, traditional preservation methods can be time-consuming and require careful attention to detail to ensure that the food is properly preserved and safe to eat.

On the other hand, modern preservation methods, such as freezing, vacuum packaging, and chemical preservatives, offer faster and more convenient ways to preserve food. These methods can help retain the nutritional value of the food and extend its shelf life without altering its taste or texture. However, some modern preservation methods may involve the use of artificial additives or chemicals that some people prefer to avoid.

In general, both traditional and modern preservation methods have their place in food preservation, and the best method to use will depend on individual preferences and needs. It is important to consider factors such as the type of food being preserved, available resources, and desired shelf life when choosing a preservation method.

SMART WATER MANAGEMENT SYSTEM

Yogaraj. P, Rashmika. R S, Kanishka. S, Yasodha. G,

Students, DEPARTMENT OF B.TECH AGRICULTURAL ENGINEERING, Paavai Engineering College

ABSTRACT

Water is an essential requirement for life on earth because it function as a solvent and component of all the biological process. With the usage of new technological advancements in IoT (Internet of Things) powered smart devices for water management, it can become a useful implementation towards avoiding the predicted water depletion. In India water monitoring and management were manually carried out with intensive power requirements and high capital expense with low efficiency recorded. Overflow of water overhead tanks in residential, commercial, cooperate and educational settings, as well as broken pipes resulting in spillage, irrigating the crops contribute to wastage at large. Regular reservoirs for water cannot monitor nor give analytics and automated water level detection in the tank. Vandalization or transmission blockages on damaged pipes may take so long to discover. The proposed model addresses problems mentioned above by the application of portable smart systems with interoperability and easily configurable to handle automated management of water supply with energy efficiency and smart cities as well as reduction of the rate of building degradation as a result of overflow from overhead tanks. Our model also integrates the application of Natural Language Processing for speech recognition as an alternate medium useful in operating the system.

KEYWORDS

Internet of Things (IoT), Water management, Overhead tank.

INTRODUCTION

Overflowing tanks and reservoirs are arguably amongst the biggest cause of water wastage across urban and rural areas. Often time results from forgetful control of the pump

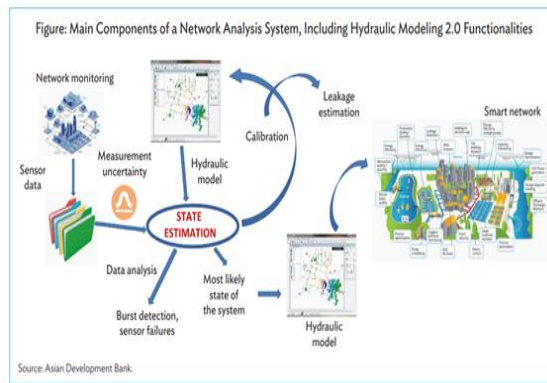

switches and the absence of timely human presence to turn off the running motto when the overhead tank begins to overflow. Water which is one of the most important resources for daily existence [1][5] is fast depleting and falling in supply to meet the growing demand by rising population. Thus the need to proffer cost-effective smart automated systems for water management. A lot of buildings degrade over a short period due to consistent overflow of high rise tanks and reservoirs.

Other than the overall worries of freshwater shortage for a household reason, there are rising worries for the shortage of water for agrarian purposes [2, 3]. To handle the difficulties of water shortage, Smart water management and automation can greatly address the water crisis by eliminating endless running of pumping motors even after water tanks are filled to maximum.

This smart management model is conceivable principally by constant observing of water level and quantity. [8] Constant water level observation can essentially decrease the wastage of water subject to flooding from tanks or reservoirs. The smart management framework [13, 14, 15, 16, 17] can likewise assist with identifying water spills in a savvy home by examining water levels during various hours of the day. A smart water management framework as such is a desperate requirement for the drive toward green IoT on our planet.

Several years ago, the high cost of implementing automated water management systems led to the low adoption of such technologies. Lately, with the advent of the Internet of Things (IoT) for smart urban areas [4], the expense has decreased altogether. Web 2.0 and [6] the development of low-powered smart devices at relatively low prices has made associated gadgets with the capacity to exchange information accessible to just anyone.

Fig.1 presents an outline of functionalities obtainable with IoT based water management system. It, by and large, indicate tank state sensing capability using sensors [2], the ability of smart meters useful in measuring usage over time, real-time analysis is also a notable function obtainable in smart water management, spillage or hardware damage can also be detected as well as remotely controlling the pumping motto through a web interface or automated switching of the motor based on water level [1,2,3,4,5]. Smart valves for schedule irrigation is another exciting functionality possible with automated water management.

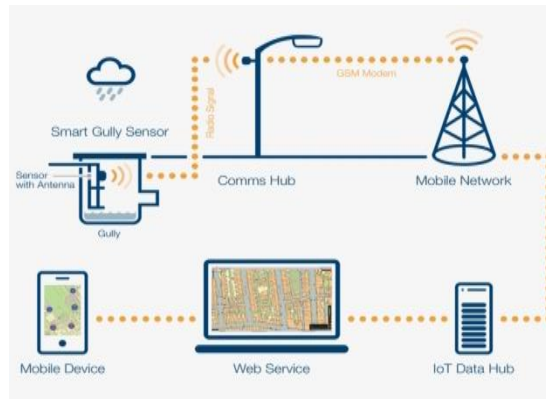

LITERATURE SURVEY

In [2] the authors pointed out the lack of standardization of IoT devices to allow smooth interoperability amongst varying vendors. My proposed model combines low-cost and lowpower hardware that interoperates seamlessly. An ultrasonic sensor was used by [6] for water level sensing with reliance on the sound bombarding the water surface from the sensor consisting of a speaker which generates ultrasonic sound waves and a mic to detect the resonance from the water surface; this approach is prone to erroneous reading as surrounding sound external to the tank could trigger the sensor reading. I proposed in this paper the use of a laser sensor which gives a more reliable water level sensing independent of the external environment of the overhead tank.

Proposed Work

Proposed in this paper is a description of the setup of a smart water management system using an IoT control console connected to a cloud management dashboard as illustrated in Fig.2 Showcasing IoT devices like water level indicator sensors, smart switch for the pumping motor hardware, wireless transceivers for device connectivity, and a management dashboard that can be accessed and controlled from a user's smartphone or PC. The dashboard shows real-time analytics on water level and usage metrics.

Hardware and Software Requirements

A laser sensor of VL53LOX for precise water level indication in storage tanks can be utilized. This type of sensor can sense the water level in real-time and with an attached HC12 transmitter for data transfer to the cloud platform.

Components within the transmitter can comprise of an Arduino and NodeMcu utilizing low power and transmitting data using any of the wireless technology such as Zigbee, Low Power Wide Area Networks (LPWANs), RFID or Wi-Fi / Wi-Fi HaLow. The use of such transmitters combined can enable automated water level detection and system controlled refilling of water storage tanks.

Incorporating a VL53LOX sensor module positioned at the topmost part inside the reservoir opposite the fluid level uses a laser-based time-of-flight (ToF) distance ranging technique. Invisible infrared laser rays are bounced from any surface thus measuring the time taken for the light to reach the detector. The values obtained from the sensor recordings at varying time intervals are transmitted to the cloud Ardafruit implementation.

A minimum threshold can be taken as V_1 at time t_1 and maximum water height defined as V_2 at time t_2 , actualtime T taken to fill the tank when empty is determined by equation (1).

$$T = v_2 t_2 - v_1 t_1 \quad (1)$$

In equation (2) the pump switch is activated A_i automatically when the water level in the tank detected by the sensor is equal to V_1 .

$$A_i = v_1 \quad (2)$$

and deactivate D_i in equation (3) when the water level equals V_2 .

$$D_i = v_2 \quad (3)$$

Let the varying water level measured during fill up or usage time be n , thus V_n indicates the current water level at time t_n . Tank water level L in equation (4) at a particular time is given by

$$L = V_2 t_2 - v_n t_n \quad (4)$$

The values received from the laser sensor are communicated to the cloud platform from which users can gain analytical insights of water status in the tank. The Adafruit dashboard can also indicate the pump status to users allowing for turn on/off of the pump remotely. Values received from the sensor are transmitted to the pumping motor through the HC12 wireless transmitter to activate or deactivate the pump motor remotely. Power consumption is greatly reduced by using automated switching dependent on the sensor values thus preventing the motor pump from running endlessly when the tank is filled to the defined maximum V_2 .

NodeMCU [3,4,5] which is useful for the deployment of IoT applications connects the system to cloud storage. The Adafruit cloud platform is a useful implementation for such a purpose. The platform can show the real-time value received and compute the current water level. The continuous level measured by the laser sensor is transmitted to the NodeMcu and to the Adafruit cloud platform from which graphical representation of water level at a given time can be visualized and further analyze water usage.

- The combination of Arduino [2, 3] Uno hardware, Relay, HC12 receiver connected to the motor can serve as receiver unit of the setup. When the data received from the sensor is V_1 then the motor is activated to running mode by a smart Relay switch and deactivated when the value is V_2 .
- This implementation ensures that water tanks and reservoirs do not overflow continuously thereby wasting this precious resource. It automates water refill into tanks as well for continuous water availability to users. In using the Adafruit cloud platform, users can gain analytics of average daily quantity use and time taken for the water tank to be filled when the lower configured limit is reached.
- Leakage can be assumed as well by comparing [7] the expected fill-up time at any given level against the wait time to fill up if it exceeds outrageously then a leakage notification can be prompted.

CONCLUSION AND FUTURE SCOPE

We proposed a flexible, economical, easily configurable portable system for water management and wastage reduction. The implementation described above can be expanded to smart agricultural processes of watering plants and gardens. In present days liquid level monitoring is essential in oil sectors, automotive, and many others. The proposed solution can automate the process of liquid detection and optimum management as well as use analytics with insights for detecting leakages, vandalism, or any form of damages along supply tracks. A high percentage of wastage can be greatly reduced and accurate billing reading for the used resource can be achieved. In the future, we look forward to integrating speech recognition using the Adafruit IO web interface. This will extend the remote activation or deactivation of the motor using voice commands.

Tractors With Global Navigation Satellite System

Naveena Nava Bharathi. P T, Muthu Priya. M, Nandhini. A, Kanishka. K

Department of Agriculture Engineering, Paavai Engineering College, Namakkal, Tamil Nadu, India

Abstract

Modern agriculture faces the challenge of feeding a growing global population while minimizing environmental impact and maximizing productivity. Global Navigation Satellite System (GNSS) technology has revolutionized the agricultural sector by enabling precision farming practices. This abstract explores the role of GNSS-enabled tractors in enhancing agricultural efficiency. GNSS technology allows tractors to precisely navigate fields, perform automated tasks such as planting, fertilizing, and harvesting, and optimize resource use. By integrating GNSS receivers, inertial sensors, and advanced algorithms, tractors can achieve centimeter-level accuracy in positioning and guidance. The benefits of GNSS-enabled tractors include improved yield, reduced input costs, lower environmental impact, and enhanced safety. Farmers can optimize field operations, reduce overlap, and minimize wastage of resources such as seeds, fertilizers, and pesticides. Additionally, GNSS technology enables farmers to monitor and manage their fields more effectively, leading to better decision-making and higher productivity. In conclusion, GNSS-enabled tractors play a crucial role in modern agriculture by offering precision, efficiency, and sustainability. Continued advancements in GNSS technology are expected to further enhance the capabilities of tractors, leading to more sustainable and productive farming practices.

Keywords

GNSS Technologies, perform automated tasks and minimize wastage of resources.

INTRODUCTION

The Global Navigation Satellite System (GNSS) has emerged as a revolutionary technology that enables precise positioning, navigation, and timing services worldwide. GNSS systems such as GPS, Galileo, GLONASS, and BeiDou have transformed various industries and everyday life by providing accurate location information to users around the

globe. This essay explores the evolution, working principles, applications, and future prospects of GNSS technology. era of seed accessibility and cultivation. At its core, the machine employs intelligent algorithms to recommend the most suitable seeds based on local conditions, ensuring a successful gardening experience for users of all levels.

The concept of satellite-based navigation originated in the early 1960s with the launch of the Transit system by the United States Navy. The development of GPS by the US Department of Defense in the 1970s marked a significant milestone in satellite navigation. Since then, other countries have developed their GNSS systems, leading to the establishment of a global network of satellites providing positioning and timing.

In agricultural machinery automatic navigation, researchers usually use information fusion methods to enhance the accuracy and stability of the navigation system. At present, the widely used fusion method is to use the acceleration and attitude angle information measured by the inertial navigation system to predict dead reckoning and then correct the global navigation satellite system (GNSS) measured coordinate value in accordance with the error probability.

COMPONENTS AND WORKING

Figure 1: GNSS TRACTOR WORKING

Components of GNSS in agriculture include satellites, ground stations, and receivers. Satellites are like stars in the sky, which constantly send signals to the ground to tell receivers where they are. Ground stations use radar to confirm whether the satellite is in line with the predicted position. Receivers were mounted on machinery. It continuously searches for signals from satellites to figure out the precise position of the machinery and guide it to go on the right track.

Therefore, GNSS technology is usually applied to the auto steer navigation system in precision agriculture to improve operation accuracy.

GNSS system on tractor guidance

Tractors equipped with GNSS systems can run automatically and maintain high-precision operation for a long time. It can also effectively avoid skips and overlaps caused by manual operation, which improves work efficiency greatly. The GNSS guidance systems for farm tractors play a key role in controlling the cost and increasing the yield of farmlands.

Firstly, as the GNSS guidance systems for tractors for sale in our online store have shown, the systems enable the tractor to maintain a high accuracy of 2.5cm during operations. No matter whether it's during the day or at night, or in the rain or haze, the tractor can work well. Weather won't affect the tractor's operation in the field.

Secondly, the tractor GNSS guidance system can greatly reduce farmers' pressure. They don't need to be always in the field because GNSS will ensure that the tractor runs straightly by itself. If you adopt higher technology with U-turn, your tractors can even turn around at the headland by themselves. Therefore, tractor drivers will be able to save their time and energy to prepare for the next season, or they can simply enjoy quality family time. It is also conducive to the management and production of the farm.

FUNCTION OF GNSS

Automatic driving system is a comprehensive system integrating satellite signal reception, positioning & orientation and automatic control. GNSS high-precision satellite navigation system is the key to automatic driving system, mainly composed of GNSS high-precision antennas and positioning & orientation terminals. It can obtain high-precision position information in real time. According to the parameters such as the position and attitude, automatic driving system sends instructions to the steering system in real time based on the calculation of the controller. In this way, agricultural machinery can work according to the planned route of the navigation displayer.

Figure 2: Tractor With GNSS

Application Solution

To meet industry needs, Harxon provides customized GNSS high-precision antennas, wireless data radios and positioning solutions. The combination of GNSS high-precision antennas and wireless data radios, and smart antennas can determine the position, heading, and attitude of agricultural machinery. While improving the efficiency of agricultural machinery, it can ensure centimeter-level accuracy of farmland operations such as tilling, sowing, spraying, and harvesting. In this way, labor intensity is brought down, time investment and fuel consumption are reduced and per unit area yield is increased.

State of GNSS in Scientific Studies Indexed in WoSCC Related to PA

According to the number of scientific papers indexed in the WoSCC, GPS is a dominantly used GNSS system for both “agriculture” and “precision agriculture” topics, with the annual number of scientific papers growing rapidly between 2000 and 2022 (Figure 1). However, its overall application in agriculture has a more linear upward trend in comparison to PA, as represented by the coefficient of determination (R^2) from linear regression. The presence of broad GNSS topics is increasingly used in scientific studies with GPS, while the studies which focus on other individual GNSS components (GLONASS, Galileo, or BeiDou) remain relatively low.

Figure 3: The annual number of scientific papers indexed in WoSCC per GNSS component.

The use of GNSS technology in agriculture is expected to grow further with advancements in satellite technology, sensor technology, and data analytics. This will enable even more precise and efficient farming practices.

ADVANTAGES

- **Precision Agriculture:** Tractors with GNSS technology enable precision agriculture practices such as precision planting, variable rate application of inputs (fertilizers, pesticides), and precision harvesting. This precision helps farmers optimize yields, reduce costs, and minimize environmental impact.
- **Auto-steering:** Tractors with GNSS can be equipped with auto-steering systems, which can automatically steer the tractor along planned paths with high accuracy. This reduces driver fatigue and improves efficiency.
- **Overlap and Skip Control:** GNSS technology helps in reducing overlaps and skips in field operations, ensuring that each area is treated correctly, which can save on inputs like seeds, fertilizers, and pesticides.
- **Data Management:** GNSS-equipped tractors can collect data about field conditions, such as soil properties and yield variability. This data can be used to make informed decisions about crop management and improve overall farm productivity.

- **Time and Fuel Savings:** Precision guidance from GNSS can help reduce the time and fuel required for field operations, leading to cost savings and reduced environmental impact.
- **Remote Monitoring and Control:** Some GNSS systems offer remote monitoring and control capabilities, allowing farmers to monitor their tractors' performance and location in real-time.

CONCLUSION

In conclusion, tractors equipped with GNSS technology are transforming the agricultural industry by improving efficiency, productivity, and sustainability. The ability to use satellite positioning for tasks such as auto-steering, mapping, and precision farming allows farmers to operate with greater precision and accuracy. This results in reduced input costs, lower environmental impact, and increased yields. As GNSS technology continues to advance, we can expect further innovations that will enhance the capabilities of tractors and further revolutionize modern agriculture.

ABSTRACT

Malicious (spam) social bots generate and spread fake tweets and automate their social relationships by pretending like a follower and by creating multiple fake accounts with malicious activities. Furthermore, malicious social bots post shortened malicious URLs in the tweet in order to redirect the requests of online social networking participants to some malicious and suspicious servers. Hence, distinguishing malicious social bots from legitimate users is one of the most tasks in the Twitter network. To detect malicious or suspicious social bots, extracting URL-based features that include frequency of shared URLs, DNS feature, network features, link popularity features and spam content presents in URL requires less amount of time comparatively with social graph-based features (which rely on the social interactions of users). Moreover, malicious social bots cannot quickly manipulate URL redirection chains. In this, a learning automata-based malicious social bot detection (LA-MSBD) algorithm is a Machine Learning approach proposed by integrating a Naïve Bayes algorithm model with URL-based features(URL Classification and Feature Extraction) for identifying trustworthy participants (users) in the Twitter network. Experimentation has been performed on 2 Twitter data sets, and the results obtained illustrate that the proposed algorithm achieves improvement in precision and detection accuracy.

KEY WORDS

Learning Automata, Friends recommendation URL Classification, Feature Extraction, Online social network.

INTRODUCTION

Twitter being a micro-blogging platform used by an increasing population of users of different age groups over the last decade. Generally, people post tweets and interact with other users as well. More specifically, they (users) can follow (following/friends) their favorite politicians, celebrities, athletes, entrepreneur, artists, friends and get followed by them (followers). Furthermore, Twitter generates a list of the topics being discussed day-to-day updates, that so called trending topics. Hence, users can get informed about the hot topics of discussion on a daily basis. And generally online social networks (OSNs) are increasingly used by automated accounts, well known as bots, due to their immense popularity across a wider range of user categories. It is estimated that over 15% of accounts on Twitter are automated bot accounts .A customer support chatbot is a prime example of a Twitter bot. It can help and improve the overall customer support experience by improving the response time. Following few are the most useful and amazing bots on Twitter.

Fig 1: Bot Bootstrap

Moreover, a malicious social larva might post shortened phishing URLs within the tweet. Twitter bots are often an excellent facilitate in several distinctive ways that, there square measure cases wherever they were used unethically and illicitly. Hence, it's vital to identifying malicious social bots from legitimate users is one in all the foremost vital tasks within the Twitter network. The researchers at Indiana and North-eastern University had developed a brand new tool referred to as BOTOMETER, that tells concerning the chance of a Twitter network user being a larva. It's extremely troublesome to see AN threshold share

to observe the bots however or so the score is nearer to 100%, the likelihood of the account being a larva will increase. The systems square measure being trained to acknowledge the larva behavior and analyze supported the patterns in a very dataset of over thirty,000 accounts that were initial verified by the human researchers as either bots or non-bots. Botometer a tool that “reads” over a thousand different characteristics, or “features,” for each account and then assigns the account a score between 0 and 1.

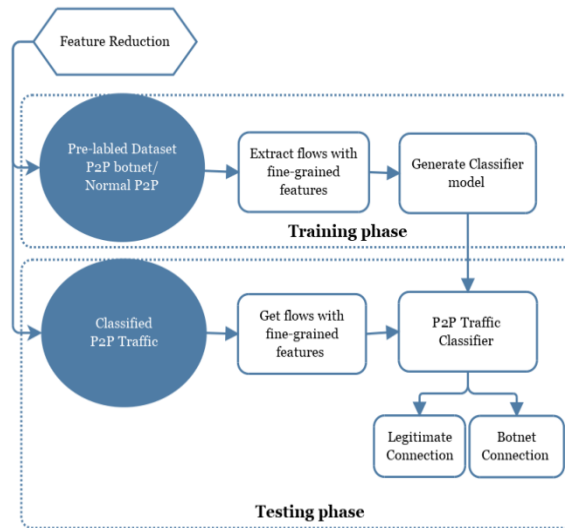

Fig 2: Bot Testing

The higher the score, the more the chances the account is automated. By the process and experiments being done one can estimate and understand the level of difficulty is too high and even time consuming to detect an twitter account is being or not and then the main task comes into role while the account if detected as bot is being purposive or subversive. Detecting an account is automated or not involves complicated steps and again detecting that automated account is malicious or legitimate is more complicated. Several techniques, including supervised, unsupervised and reinforcement learning, have been proposed to detect bots and its malicious activities in Twitter. These techniques mainly use a limited number of features extracted for identifying the automated accounts at account-level. However, there exists bots that have grown mechanisms to mimic human behavior and avoid detections. Therefore, new techniques should be proposed for securing the legitimate users from the proliferation of malicious accounts in the Twitter Network.

LITERATURE SURVEY

In our daily lives, social media has become increasingly crucial. People naturally flock to this medium to read and share news, given that billions of users produce and consume information every day. Social media bots are little program that can be deployed on social media platforms to perform a variety of useful and destructive functions while encouraging human behavior . Some social media bots provide helpful services like weather and sports scores. These excellent social media bots are clearly labelled as such, and those who connect with them are aware that they are bots. A huge majority of social media bots, on the other hand, are harmful bots masquerading as human users. Users lose faith in social media platforms' ability to offer accurate news as a result of these bots, since they suspect that the stories at the top of their feeds were "pushed" there by manipulative bots. Because so many individuals are using social media, malevolent users such as bots have begun to manipulate conversations in the direction that their makers desire.[2]

These malicious bots have been used for nefarious purposes such as spreading false information about political candidates, inflating celebrities' perceived popularity, deliberately suppressing protestors' and activists' messages, illegally advertising by spamming social media with links to commercial websites, and influencing financial markets in an attempt to manipulate stock prices. Furthermore, these bots have the ability to alter the outcomes of standard social media analysis. Social media bots use a variety of attack strategies, including: Sleeper bots are bots that sleep for lengthy periods of time before waking up to unleash an attack of thousands of postings in a short period of time (perhaps as a spam attack), and then sleep again. jacking the trend - the use of top trending topics to focus on a certain audience for the purpose of targeting, An attacker employs a watering hole assault to estimate or watch which websites a company frequently visits and infects one or more of them with malware. Click farming or like farming-inflate fame or popularity on a website by like or reposting content via click farms, and hashtag hijacking- use of hashtags to focus an assault (e.g. spam, harmful links) on a specific audience using the same hashtag. In social media, bot detection is a critical duty. [5]

Automated accounts are a problem on Twitter, a popular social networking platform. According to certain surveys, roughly 15% of Twitter accounts operate automatically or semiautomatically. The peculiarities of Twitter could be one factor that has contributed to

the rise in bots. It's also worth noting that a Twitter bot is recognised as a reliable source of information. Although social networking sites have improved our social life, there are still some drawbacks. In online social networks, malicious social bots are a widespread problem. These malevolent social bots are being utilised for a variety of things, including artificially inflating a person's or movement's popularity, influencing.[10]

METHODS

We proposed as an alternative to the user-based neighborhood approach. We first consider the dimensions of the input and output of the neural network. In order to maximize the amount of training data we can feed to the network, we consider a training example to be a user profile (i.e. a row from the user-item matrix R) with one rating withheld. The loss of the network on that training example must be computed with respect to the single withheld rating. The consequence of this is that each individual rating in the training set corresponds to a training example, rather than each user. As we are interested in what is essentially a regression, we choose to use root mean squared error (RMSE) with respect to known ratings as our loss function.

Compared to the mean absolute error, root mean squared error more heavily penalizes predictions which are further off. We reason that this is good in the context of recommender system because predicting a high rating for an item the user did not enjoy significantly impacts the quality of the recommendations. On the other hand, smaller errors in prediction likely result in recommendations that are still useful – perhaps the regression is not exactly correct, but at least the highest predicted rating are likely to be relevant to the user. Data Processing is a task of converting data from a given form to a much more usable and desired form i.e. making it more meaningful and informative. Using Machine Learning algorithms, mathematical modeling and statistical knowledge, this entire process can be automated.[3] The output of this complete process can be in any desired form like graphs, videos, charts, tables, images and many more, depending on the task we are performing and the requirements of the machine.

This might seem to be simple but when it comes to really big organizations like Twitter, Facebook, Administrative bodies like Parliament, UNESCO and health sector organizations, this entire process needs to be performed in a very structured manner.

The most crucial step when starting with ML is to have data of good quality and accuracy. Data can be collected from any authenticated source like data.gov.in, Kaggle or UCI dataset repository. For example, while preparing for a competitive exam, students study from the best study material that they can access so that they learn the best to obtain the best results. In the same way, high-quality and accurate data will make the learning process of the model easier and better and at the time of testing, the model would yield state of the art results.[8]

A huge amount of capital, time and resources are consumed in collecting data. Organizations or researchers have to decide what kind of data they need to execute their tasks or research. Example: Working on the Facial Expression Recognizer, needs a large number of images having a variety of human expressions. Good data ensures that the results of the model are valid and can be trusted upon.

RESULT ANALYSIS

Social bots are automated social media accounts governed by software and controlled by humans at the backend. Some bots have good purposes, such as automatically posting information about news and even to provide help during emergencies. Nevertheless, bots have also been used for malicious purposes, such as for posting fake news or rumour spreading or manipulating political campaigns. There are existing mechanisms that allow for detection and removal of malicious bots automatically. However, the bot landscape changes as the bot creators use more sophisticated methods to avoid being detected. Therefore, new mechanisms for discerning between legitimate and bot accounts are much needed. Over the past few years, a few review studies contributed to the social media bot detection research by presenting a comprehensive survey on various detection methods including cutting-edge solutions like machine learning (ML)/deep learning (DL) techniques. [11]

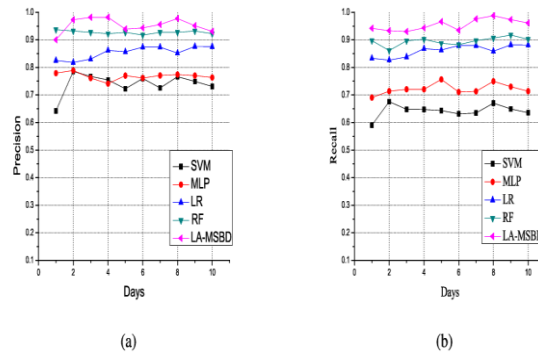

Fig 3: Result Analysis

This paper, to the best of our knowledge, is the first one to only highlight the DL techniques and compare the motivation/effectiveness of these techniques among themselves and over other methods, especially the traditional ML ones. We present here a refined taxonomy of the features used in DL studies and details about the associated pre-processing strategies required to make suitable training data for a DL model. We summarize the gaps addressed by the review papers that mentioned about DL/ML studies to provide future directions in this field. Overall, DL techniques turn out to be computation and time efficient techniques for social bot detection with better or compatible performance as traditional ML techniques.

CONCLUSION

The need for new, low-cost Bot detection systems is evident given the frequency of detecting malicious bots on social media sites such as Twitter. We suggested a Naive Bayes and Random Forest (RF) algorithm for detecting tweets or URLs that are potentially fraudulent or damaging to users. So far, we have downloaded and installed all of the software that is required for the planned system. The dataset was obtained from the Kaggle website, and the preparation stage was completed. The features of preprocessed data will be extracted in the next phase, and the method will be implemented, with a model saved that can be used to categorize the data.

Abstract

In recent years broad community of researchers has emerged, focusing on the original ambitious goals of the AI field – the creation and study of software or hardware systems with general intelligence comparable to, and ultimately perhaps greater than, that of human beings. This paper surveys this diverse community and its progress. Approaches to defining the concept of Artificial General Intelligence (AGI) are reviewed including mathematical formalisms, engineering, and biology inspired perspectives.

The spectrum of designs for AGI systems includes systems with symbolic, emergentist, hybrid and universalist characteristics. Metrics for general intelligence are evaluated, with a conclusion that, although metrics for assessing the achievement of human-level AGI may be relatively straightforward (e.g. the Turing Test, or a robot that can graduate from elementary school or university), metrics for assessing partial progress remain more controversial and problematic.

Figure 1. Artificial General Intelligence

Introduction

Landgrebe and Smith (2023)⁴ argue that it is impossible for artificial general intelligence (AGI) to succeed, on the grounds that it is impossible to perfectly model or emulate the “complex” “human neurocognitive system”. However, they do not show that it is logically impossible; they only show that it is practically impossible using current mathematical techniques. Nor do they prove that there could not be any other kinds of theories than those in current use. Even if perfect theories were impossible or unlikely, perfection may not be needed and may even be unhelpful.

What is General Intelligence?

But what is this “general intelligence” of what we speak? A little later, I will review some of the key lines of thinking regarding the precise definition of the GI concept. Qualitatively speaking, though, there is broad agreement in the AGI community on some key features of general intelligence:

- General intelligence involves the ability to achieve a variety of goals, and carry out a variety of tasks, in a variety of different contexts and environments.
- A generally intelligent system should be able to handle problems and situations quite different from those anticipated by its creators.

The main principles driving the scientific discovery process

The dominant approach of current AI systems focus on solving specific narrow problems, this approach has key limitations in its generalization ability as discussed in earlier sections. The evolution-inspired path [83, 126-127] could provide an alternative way to build more general AI systems. However, the extremely large search space and the existence of many complex interacting parts still represent a major obstacle. In this study, we argue that the building of these systems should be guided by a set of principles as an alternative of narrow objectives or open-ended evolution. The use of these principles is backed by many historical examples of how different scientists made their discovery. Most scientific discoveries could be understood as instances of the use of one or more of these principles. They are the main approach used by scientists to solve problems and discover new knowledge. The use of these principles provides a way for machine learning systems to

improve their generalization ability and to cut down the large search space of hypotheses by approaching the given problem using these principles in template ways as an alternative of the expensive random search.. In addition to logic, which plays an important role in the scientific discovery process, in reality, logic alone is not enough, we usually use more sophisticated principles and structures. In the literature, there is a focus on two main principles, concepts combination and analogies. However, other principles should be taken into account to build a comprehensive framework. Different problems in science can be solved using one or more of these principles by using these principles in template ways. For instance, some problems require finding the equation that fits the experimental data, some problems require finding the optimization criteria that give rise to the observed phenomenon, other problems require finding the rules or the program that gives rise to the observed phenomenon, many problems require combining different ideas, unifying ideas or finding analogy with other ideas, and so on. Each scientific problem comes with an objective to meet, the problem could be approached by these principles to find which principle best satisfy the objective. These principles should seek to expand the knowledge base by discovering new knowledge, they should also reveal new connections that link different concepts. Proposing theoretical and computational frameworks that encapsulate these principles is beyond the scope of this paper. These principles can be summarized as follow.

Figure 2. AGI concepts and Technology

AGI Core Requirements

To get to AGI we begin by examining the phenomenon at the core of the enterprise - intelligence. Intelligence means succeeding at goals for which there are no rules in

environments you have never seen before, cannot control, and that are constantly changing. (cf. Legg and Hutter 2007) The key implementing mechanism for intelligence is simulation. Whenever an intelligent agent needs to think, plan, adapt to change, make a choice or decision, determine how to feel about an event, and/or accomplish any other traditionally ‘cognitive’ task, the best (and typically only) way to accomplish this is to accurately simulate the context within which we want to realize our goals. We simulate the future created by each potential option so as to discover which ones create the best outcomes. Simulations not only teach us how we can achieve our goals but also what might go wrong, what risks we might face, and what we should do in response. They help us discover what our highest goals ultimately should be. And thinking is best understood as a form of simulation; imagine deciding whether or not to marry a particular person. In our mind’s eye, we’d simulate what our lives would be like with that person, how we think we would feel, and whether or not we think things would work out. We’d simulate every key aspect of life and ultimately make our decision based on where our simulations took us. 2 As we cover in much more depth below, the ability to accurately simulate emotions is essential to intelligence and AGI. But all emotions arise from consequences; it’s impossible to know how to feel about something until we’re able to imagine (that is, simulate) how it will affect us.

Figure 3. Human vs AGI

Emergence

Emergence is a powerful approach to explain complex behaviors by simple underlying rules. One notable example is birds flocking, some birds fly in coordinated flocks that show remarkable synchronization in movements. Heppner [60] showed that the coordinated

movements could be the result of simple individually. Another example is the Game of Life [61], a two-dimensional cellular automaton with rules that avoid the formation of structures that grow freely or quickly disappear. Remarkable behaviors have been observed such as the glider, a small group of cells that moves like an independent emergent entity. The main purpose of the algorithm that encapsulates the emergence principle would be to find the set of rules that gives rise to the emergent behavior.

The Scope of the AGI Field

Within the scope of the core AGI hypothesis, a number of different approaches to defining and characterizing AGI are under current study, encompassing psychological, mathematical, pragmatic and cognitive architecture perspectives. This paper surveys the contemporary AGI field in a fairly inclusive way. It also discusses the question of how much evidence exists for the core AGI hypothesis – and how the task of gathering more evidence about this hypothesis should best be pursued. The goal here is not to present any grand new conclusions, but rather to summarize and systematize some of the key aspects AGI as manifested in current science and engineering efforts. It is argued here that most contemporary approaches to designing AGI systems fall into four top level categories: symbolic, emergentist, hybrid and universalist. Leading examples of each category are provided, and the generally perceived pros and cons of each category are summarized. Not all contemporary AGI approaches seek to create human-like general intelligence specifically. But it is argued here, that, for any approach which does, there is a certain set of key cognitive processes and interactions that it must come to grips with, including familiar constructs such as working and long-term memory, deliberative and reactive processing, perception, action and reinforcement learning, metacognition and so forth. A robust theory of general intelligence, human-like or otherwise, remains elusive. Multiple approaches to defining general intelligence have been proposed, and in some cases these coincide with different approaches to designing AGI systems (so that various systems aim for general intelligence according to different definitions). The perspective presented here is that a mature theory of AGI would allow one to theoretically determine, based on a given environment and goal set and collection of resource constraints, the optimal AGI architecture for achieving the goals in the environments given the constraints. Lacking such a theory at present, researchers must

conceive architectures via diverse theoretical paradigms and then evaluate them via practical metrics. Finally, in order for a community to work together toward common goals, environments and metrics for evaluation of progress are necessary. Metrics for assessing the achievement of human level AGI are argued to be fairly straightforward, including e.g. the classic Turing test, and the test of operating a robot that can graduate from elementary school or university. On the other hand, metrics for assessing partial progress toward, human-level AGI are shown to be more controversial and problematic, with different metrics suiting different AGI approaches, and with the possibility of systems whose partial versions perform poorly on commonsensical metrics, yet whose complete versions perform well. The problem of defining agreed-upon metrics for incremental progress.

AGI versus Human-Level AI

One key distinction to be kept in mind as we review the various approaches to characterizing AGI, is the distinction between AGI and the related concept of “human-level AI” (which is usually used to mean, in effect: human-level, reasonably human-like AGI). AGI is a fairly abstract notion, which is not intrinsically tied to any particular characteristics of human beings. Some properties of human general intelligence may in fact be universal among all powerful AGIs, but given our current limited understanding of general intelligence, it’s not yet terribly clear what these may be. The concept of “human-level AGI”, interpreted literally, is confusing and ill-defined. It’s difficult to place the intelligences of all possible systems in a simple hierarchy, according to which the “intelligence level” of an arbitrary intelligence can be compared to the “intelligence level” of a human. Some researchers, as will be discussed below, have proposed universal intelligence measures that could be used in this way; but currently the details and utility of such measures are both quite contentious. To keep things simpler, here I will interpret “human-level AI” as meaning “human-level and roughly human-like AGI,” a restriction that makes the concept much easier to handle. For AGI systems that are supposed to operate in similar sorts of environments to humans, according to cognitive processes vaguely similar to those used by humans, the concept of “human level” is relatively easy to understand.

Figure 4. Characterizing Approach of AI

A Mathematical Approach to Characterizing General Intelligence :

In contrast to approaches focused on human-like general intelligence, some researchers have sought to understand general intelligence in general. The underlying intuition here is that

- Truly, absolutely general intelligence would only be achievable given infinite computational ability. For any computable system, there will be some contexts and goals for which it's not very intelligent
- However, some finite computational systems will be more generally intelligent than others, and it's possible to quantify this extent

This approach is typified by the recent work of Legg and Hutter who give a formal definition of general intelligence based on the Solomonoff-Levin prior. Put very roughly, they define intelligence as the average reward-achieving capability of a system, calculated by averaging over all possible reward-sumable environments, where each environment is weighted in such a way that more compactly describable programs have larger weights. According to this sort of measure, humans are nowhere near the maximally generally intelligent system. However, humans are more generally intelligent than, say, rocks or worms. ¹⁰ While the original form of Legg and Hutter's definition of intelligence is impractical to compute, a more tractable approximation has recently been developed (Legg and Veness, 2013). Also, Achler (Achler, 2012b) has proposed an interesting, pragmatic AGI intelligence measurement approach explicitly inspired by these formal approaches, in the

sense that it explicitly balances the effectiveness of a system at solving problems with the compactness of its solutions. This is similar to a common strategy in evolutionary program learning, where one uses a fitness function comprising an accuracy term and an “Occam’s Razor” compactness term.

Discussion and Conclusion

This paper has presented a review of different machine learning techniques used in scientific discovery with their limitations. It discussed and reviewed the main principles used by scientists to solve problems and discover new knowledge. We argue that a key step to improve the generalization ability of AI systems is to build systems guided by these principles rather than focusing on solving specific and narrow problems, or searching the extremely large space of the evolution inspired approaches. The main challenge to build The main challenge to build science discovery machines and automate the scientific discovery process is to build the theoretical and computational frameworks that encapsulate these principles. Although some principles are harder to automate where the challenge of building representation and models of the world is more dominant such as concepts combination and analogy. However, a lot of progress can be made in working on other principles such as mathematization, emergence, etc. Deep learning could be a very effective tool to implement some of these principles, it has shown promising results for the mathematization principle. However, it might be limited for other principles. In the literature, there is a focus on few principles, we believe that there are rooms for many interesting future contributions by working on the rest of the principles by building different theoretical and computational frameworks or by investigating the use of some existing AI techniques. Incorporating these principles fully in an automated scientific discovery framework might open the doors for many advancements. Pursuing this research direction holds a great promise to help scientist in their research and to speed up the scientific discovery process.

Abstract

The integration of data mining with warehousing is then explored, highlighting the synergy between these disciplines in enabling comprehensive knowledge discovery. Data mining and warehousing have become indispensable components of modern information systems, facilitating the extraction of actionable insights from vast volumes of data. Transitioning to data warehousing, the paper delves into the architecture and components of data warehouses, encompassing data extraction, transformation, loading (ETL), and multidimensional modeling techniques such as star and snowflake schemas. Furthermore, it examines the role of OLAP and data cube technology in enabling efficient analysis and querying of warehouse data.

The paper concludes by emphasizing the critical role of data mining and warehousing in unlocking valuable insights from complex data ecosystems, innovation driving, and fostering data-driven decision-making in diverse domains.

Keywords

Architecture, ETL, OLAP, Data ecosystem, Data -driven decision-making.

INTRODUCTION

Data mining differs from the conventional database retrieval in the fact that it extracts hidden information or knowledge that is not explicitly available in the database, whereas database retrieval extracts the data that is explicitly available in the databases through some query language.

It focuses on Web mining where it addresses the issues and challenges present in it. Finally, it describes the integration technique where data mining and data warehousing system can be combined for an effective functionality [1]. As data mining is an

interdisciplinary field, it uses algorithms and techniques from various fields such as statistics, machine learning, artificial technology.

Data Mining And Warehousing Concept's

Data mining is the process of nontrivial extraction of implicit, previously unknown and potentially useful information from the raw data present in the large database [2]. It is also known as Knowledge Discovery in Databases (KDD). Data mining techniques can be applied upon various data sources to improve the value of the existing information system. When implemented on high performance client and server system, data mining tools can analyse large databases to deliver highly reliable results.

Data warehousing is the location where it stores subject oriented and task relevant data for an organization decision support system. It contains data that are most important and relevant to decision making process Information from heterogeneous sources is integrated in advance and stored in warehouses for direct query and analysis. The detailed information of data warehouse is below in figure1.1.

Fig:1 The Data Warehouse: A Blend of Technologies.

Database Architecture For Parallel Processing

Software Parallelism is a natural follow-on to hardware parallel architectures. In addition to the parallel operating system, an adaptable parallel database. There are three main DBMS software architecture styles: Shared-everything architecture, shared disk architecture, and shared-nothing architecture[3].

i) SHARED EVERYTHING ARCHITECTURE:

Shared-memory or shared-everything style is the traditional approach to implementing an RDBMS on SMP hardware. It is relatively simple to implement, and has been very

successful up to the point where it runs into the scalability limitations of the shared-everything architecture. In shared memory SMP systems, the DBMS assumes that multiple data based components executing SQL statements communicating each other by exchanging message and data via the shared memory.

ii) SHARED DISK ARCHITECTURE:

Shared Disk Architecture implements a concept of shared ownership of the entire database between the RDBMS servers. Each of which is running on a node of a distributed memory systems. Each RDBMS server can read, write, update and read records from the same shared database which is required to implement a form of a distributed lock Manager.

iii) SHARED-NOTHING ARCHITECTURE:

In shared-nothing distributed memory environment the data are partitioned across all the disks and the DBMS is partitioned across multiple co-servers each of which resides on individual nodes of the parallel system and has an ownership of its own disk and thus its own database partition. A shared-nothing RDBMS parallelizes has it shown memory and disks and communicated with other processor by exchanging messages and data over the interconnection networks this architecture is optimized specifically for the MPP and cluster system.

MULTIDIMENSIONAL DATA MODEL

A data warehouse is based on a multidimensional data model which views data in the form of a data cube.

FROM TABLES AND SPREADSHEETS TO DATA CUBES:

A data cube, such as sales, allows data to be modeled and viewed in multiple dimensions [4]. Dimensions are perspectives or entities with respect to which an organization wants to keep records such as time, item, branch, location etc.

- Dimension tables, such as item (item_name, brand, type), or time(day, week, month, quarter, year) gives further descriptions about dimension.
- Fact table contains measures (such as dollars sold) and keys to each of the related dimension tables. In data warehousing literature, an n-D base cube is called a base cuboid. The top most 0-D cuboid, which holds the highest-level of summarization, is called the apex cuboid.

Fig.2 A Lattice of Cuboids

MEASURES

THREE CATEGORIES

Distributive: If the result derived by applying the function to n aggregate values is the same as that derived by applying the function on all the data without partitioning. E.g., `count()`, `sum()`, `min()`, `max()` [5].

Algebraic: If it can be computed by an algebraic function with M arguments (where M is a bounded integer), each of which is obtained by applying a distributive aggregate function. E.g., `avg()`, `min_N()`, `standard_deviation()`.

Holistic: If there is no constant bound on the storage size needed to describe a subaggregate.

E.g., `median()`, `mode(rank().)`,

TECHNOLOGIES USED

i) ON-LINE ANALYTICAL PROCESSING (OLAP):

On-Line Analytical Processing (OLAP) is a category of software technology that enables analysts, managers and executives to gain insight into data through fast, consistent, interactive access to a wide variety of possible views of information[6] that has been transformed from raw data to reflect the real dimensionality of the enterprise as understood by the user which is shown below.

Fig.3 MOLAP architecture

i) NEED FOR OLAP:

OLAP functionality is characterized by dynamic multi-dimensional analysis of consolidated

enterprise data supporting end user analytical and navigational activities including:

- calculations and modeling applied across dimensions, through hierarchies and/or across members
- trend analysis over sequential time periods
- slicing subsets for on-screen viewing
- drill-down to deeper levels of consolidation
- reach-through to underlying detail data
- rotation to new dimensional comparisons in the viewing area

OLAP is implemented in a multi-user client/server mode and offers consistently rapid response to queries, regardless of database size and complexity.

ii) CATEGORIZATION OF OLAP TOOLS:

Multidimensional OLAP (MOLAP) and Relational OLAP (ROLAP). Hybrid OLAP (HOLAP) refers to technologies that combine MOLAP and ROLAP.

i) Multidimensional OLAP (MOLAP):

This is the more traditional way of OLAP analysis. In MOLAP, In the OLAP world, there are mainly Multidimensional two different types: data is stored in a multidimensional cube. The storage is not in the relational database, but in proprietary formats.

ii) RELATIONAL OLAP (ROLAP):

The architecture of ROLAP (or) Relational On-Line Analytical Processing is shown in below (figure1.4). This methodology relies on manipulating the data stored in the relational database to give the appearance of traditional OLAP's slicing and dicing functionality. In

essence, each action of slicing and dicing is equivalent to adding a “WHERE” clause in the SQL statement.

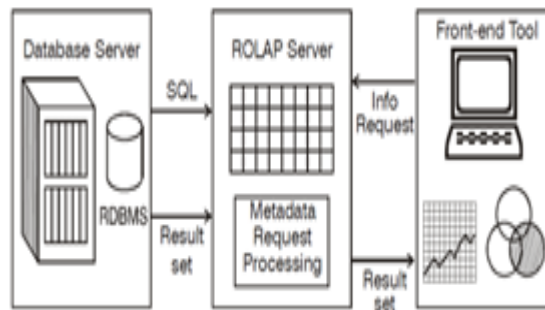

Fig 4 .ROLAP architecture

iii) HOLAP:

Hybrid online analytical processing (HOLAP) is a combination of relational OLAP (ROLAP) and multidimensional OLAP (usually referred to simply as OLAP). HOLAP can use varying combinations of ROLAP and OLAP technology. HOLAP was developed to combine the greater data capacity of ROLAP with the superior processing capability of OLAP. The architecture of HOLAP is shown Below in the figure.

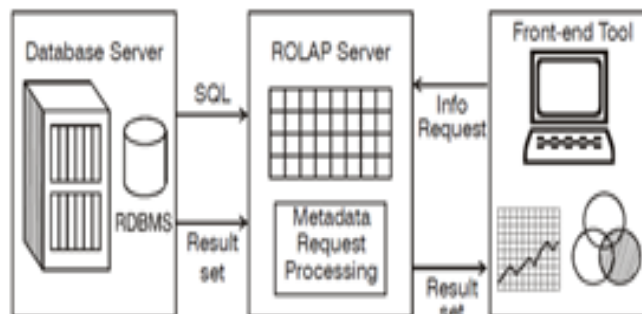

Fig. 1.5 HOLAP architecture

iii) OLAP OPERATIONS:

Roll up (drill-up): summarize data by climbing up hierarchy or by dimension reduction.

Drill down (roll down): reverse of roll-up from higher level summary to lower level summary or detailed data, or introducing new dimensions

disjoint groups: The input for the classification is the training data set, whose class labels are

Slice and Dice: project and select

Pivot (rotate): reorient the cube, visualization, 3D to series of 2D planes.

drill-within: It is switching from one classification to different one within the same dimension.

drill across: involving (across) more than one fact table

drill through: through the bottom level of the cube to its back-end relational tables(using SQL).

DATA MINING TECHNIQUES

Data mining tasks are classified into two categories[7].

1. Descriptive and
2. Predictive

Descriptive mining tasks characterize the general properties of the data in the database.

Predictive mining tasks perform inference on the current data in order to make predictions

i) ASSOCIATION ANALYSIS:

Association analysis is the discovery of association rules showing attribute value conditions that occur frequently together in a given set of data. This rule implies that the transaction of the database which contains X tends to contain Y. This rule should satisfy two interesting measure namely support and confidence. Association rules that contain a single predicate are referred to a single dimensional. Association rule Association between more than one attribute or predicate is referred as multidimensional association rule.

ii) CLASSIFICATION AND PREDICTION:

Classification involves finding rules that partition the data into already known. Classification analyses the training data set and constructs a model based on the class label and aims to assign a class label to the future unlabeled records.

iii) CLUSTER ANALYSIS:

Clustering is a method of grouping data into different groups, so that data in each group share similar trends and patterns. The objectives of clustering are :

- To uncover natural groupings.
- To initiate hypothesis about the data
- To find consistent and valid organization of the data.

Clustering analyses data objects without considering known class label. Clusters can be grouped based on the principles of maximizing intra - class similarity and minimizing interclass similarity.

IV) OUTLIER ANALYSIS:

Data objects which differ significantly from the remaining data objects are referred to as outliers. Normally outliers do not comply with the general behavior or model of the data. Hence, most of the data mining methods discard outliers as noise or exceptions. Outliers mining is used for identifying exceptions or rare events which can often lead to the discovery of interesting and unexpected knowledge in areas such as credit card fraud detection, cellular phone cloning fraud and detection of suspicious activities.

V) EVOLUTION ANALYSIS:

Data Evolution analysis describes and model regularities (or) trends of objects whose behaviour changes over time. Normally, evolution analysis is used to predict the future trends by effective decision making process.

MAJOR ISSUES IN DATA MINING

Mining different kinds of knowledge in databases [8].

- i) Interactive mining of knowledge at multiple levels of abstraction.
- ii) Incorporation of background knowledge.
- iii) Presentation and visualization of data mining results.
- iv) Data mining query languages and ad hoc data mining.
- v) Handling noisy or incomplete data.
- vi) Pattern evaluation – the interestingness problem.
- vii) Performance issues: These include efficiency, scalability, and parallelization of data mining algorithms.
- viii) Efficiency and scalability of data mining algorithms.
- ix) Parallel, distributed, and incremental mining algorithms.

CLASSIFICATION USING FREQUENT PATTERNS

Frequent pattern-based classification may overcome some constraints introduced by decision tree induction, which considers only one attribute at a time [9].

i) Associative Classification:

It consists of the following steps:

- 1) Mine the data for frequent item sets, that is, find commonly occurring attribute–value pairs in the data.
- 2) Analyse the frequent item sets to generate association rules per class, which satisfy confidence and support criteria.
- 3) Organize the rules to form a rule-based classifier

One of the earliest and simplest algorithms for associative classification is CBA (Classification Based on Associations). CBA uses an iterative approach to frequent itemset mining, similar to a priori, where multiple passes are made over the data and the derived frequent item sets are used to generate and test longer item sets.

ii) Discriminative Frequent Pattern–Based Classification:

The general framework for discriminative frequent pattern–based classification is as follows:

- 1) Feature generation: The data, D , are partitioned according to class label. Use frequent itemset mining to discover frequent patterns in each partition, satisfying minimum support. The collection of frequent patterns, F , makes up the feature candidates.
- 2) Feature selection: Apply feature selection to F , resulting in FS , the set of selected (more discriminating) frequent patterns. Information gain, Fisher score, or other evaluation measures can be used for this step. Relevancy checking can also be incorporated into this step to weed out redundant patterns.
- 3) Learning of classification model: A classifier is built on the data set D_0 . any learning algorithm can be used as the classification model.

TOOLS USED IN DATA MINING AND WAREHOUSING

Data mining and warehousing involve a variety of tools and technologies to collect, store, analyse, and extract insights from large volumes of data [10]. Here's a list of commonly used tools in these domains:

Databases:

Relational Databases: MySQL, PostgreSQL, Oracle, SQL Server.

NoSQL Databases: MongoDB, Cassandra, Redis, Couchbase

Data Warehousing Platforms: Amazon Redshift, Google Big Query, Snowflake, Microsoft Azure Synapse Analytics .

Data Mining Tools:

WEKA: A popular open-source suite of machine learning algorithms for data mining tasks.

Rapid Miner: An open-source and commercial data science platform for analytics and predictive modeling.

KNIME: Another open-source data analytics, reporting, and integration platform.

Orange: An open-source data visualization and analysis tool.

SAS: A commercial software suite offering advanced analytics, data mining, and business intelligence.

Data Visualization Tools:

Tableau: A powerful data visualization tool used to create interactive dashboards and reports.

Power BI: A business analytics tool by Microsoft for creating interactive visualizations and business intelligence reports.

QlikView / Qlik Sense: Business intelligence and data visualization tools for interactive data exploration and discovery.

ETL (Extract, Transform, Load) Tools:

Information Power Center: A comprehensive ETL tool for extracting, transforming, and loading data.

Talend: An open-source ETL tool with a comprehensive set of features for data integration.

Apache NiFi: An open-source data automation tool for moving, modifying, and managing data between systems.

Text Mining Tools:

NLTK (Natural Language Toolkit): A Python library for text analysis and natural language processing.

Stanford NLP: A suite of natural language processing tools developed by Stanford NLP Group.

spaCy: Another popular Python library for natural language processing.

Data Mining Libraries:

scikit-learn: A popular machine learning library in Python.

Tensor Flow / Keras: Deep learning libraries widely used for building neural networks.

PyTorch: Another deep learning library known for its flexibility and ease of use.

Data Quality Tools:

Trillium Software: Offers data quality solutions for data profiling, cleansing, and enrichment.

Information Data Quality: Provides data quality assessment, monitoring, and management capabilities.

Data Robot: Utilizes AI and machine learning for data quality assessment and improvement.

Cloud Services:

Amazon Web Services (AWS): Provides various services like S3, EC2, Redshift, Athena, Glue for data storage, processing, and analysis.

Google Cloud Platform (GCP): Offers services like Bigquery, Dataflow, Dataprep, and Pub/Sub for data processing and analytics.

Microsoft Azure: Provides services like Azure Data Lake, Azure SQL Data Warehouse, Azure Data bricks for data storage and analysis.

APPLICATIONS

Data mining and warehousing have numerous applications across various industries, enabling organizations to extract valuable insights from large volumes of data and make informed decisions [11]. Here are some common applications:

1) Retail and E-commerce:

- i) Market Basket Analysis,
- ii) Customer Segmentation,
- iii) Demand Forecasting,

2) Finance and Banking:

- i) Fraud Detection,
- ii) Risk Management,
- iii) Assessing credit risk,
- iv) market risk, and
- v) operational risk
- vi) Customer Churn Prediction.

3) Healthcare:

- i) Clinical Decision Support,
- ii) Disease Surveillance,
- iii) Monitoring and analysing disease outbreaks,
- iv) epidemiological trends, and
public health data,
- v) Personalized Medicine.

4) Manufacturing and Supply Chain:

- i) Predictive Maintenance,
- ii) Supply Chain Optimization,
- iii) Analysing supply chain data ,
- iv) Quality Control.

5) Telecommunications:

- i) Customer Segmentation,
- ii) Network Optimization

6) Marketing and Advertising:

- i) Customer Behavior Analysis,
- ii) Campaign Optimization,
- iii) Social Media Analytics.

CONCLUSION:

In conclusion, data mining and warehousing play crucial roles in today's data-driven world across various industries. By leveraging advanced technologies and analytical techniques, organizations can extract valuable insights from large volumes of data stored in

data warehouses. These insights enable informed decision-making, improved business processes, enhanced customer experiences, and competitive advantages [12]. Data mining facilitates the discovery of patterns, correlations, and trends within the data, while data warehousing provides a centralized repository for storing and managing data efficiently.

Abstract

Cyberbullying has emerged as a pervasive and insidious phenomenon on social media platforms, posing significant threats to individual well-being, mental health, and societal cohesion. In response to this growing challenge, the integration of artificial intelligence (AI) technologies holds promise for effectively identifying, mitigating, and preventing instances of cyberbullying. This abstract explores the application of AI-powered solutions in combating cyberbullying, examining their potential benefits, ethical considerations, and implications for fostering safer online environments. At the heart of AI-powered cyberbullying detection systems lies the capability to analyze vast amounts of textual, visual, and contextual data to identify patterns indicative of abusive behavior. Natural language processing (NLP) algorithms enable the automatic detection of harmful language, offensive content, and targeted harassment, empowering social media platforms to swiftly intervene and mitigate the impact of cyberbullying incidents. Moreover, computer vision algorithms facilitate the identification of derogatory images, memes, and videos, enhancing the efficacy of content moderation efforts in combating online abuse. Furthermore, machine learning algorithms enable the continuous refinement and adaptation of cyberbullying detection models based on evolving patterns of abusive behavior, thereby enhancing their accuracy and effectiveness over the time. By leveraging large-scale datasets annotated with labeled instances of cyberbullying, AI algorithms can learn to discern subtle nuances in language and behavior, enabling more nuanced and context-aware detection of harmful content.

Additionally, ensemble learning techniques combine multiple AI models to enhance detection accuracy and robustness, mitigating the risk of false positives and false negatives in cyberbullying detection. However, the deployment of AI-powered solutions for combatting cyberbullying raises ethical considerations pertaining to privacy, freedom of expression, and algorithmic bias. The automated analysis of user-generated content entails the collection and processing of sensitive personal data, necessitating stringent safeguards to protect user privacy and prevent potential misuse of data by social media platforms. Moreover, the automated removal or censorship of content deemed as cyberbullying raises concerns regarding censorship, content moderation, and the potential suppression of legitimate speech and dissenting viewpoints. Additionally, the reliance on AI algorithms for cyberbullying detection introduces the risk of algorithmic bias, whereby systemic biases in training data or algorithmic decision-making processes may disproportionately target certain individuals or communities. To mitigate these risks, it is imperative to employ transparent and accountable AI systems that undergo rigorous testing, validation, and auditing to ensure fairness, equity, and inclusivity in cyberbullying detection practices. Moreover, fostering user empowerment and engagement through transparent reporting mechanisms, user controls, and recourse mechanisms can enhance trust and accountability in AI-powered content moderation processes. Furthermore, the effectiveness of AI-powered solutions in combatting cyberbullying hinges on collaborative efforts among social media platforms, researchers, policymakers, and civil society stakeholders to develop robust ethical guidelines, best practices, and regulatory frameworks. By fostering interdisciplinary collaboration and stakeholder engagement, societies can harness the transformative potential of AI technologies while upholding fundamental rights, values, and norms in the digital realm.

Cyberbullying, social media, Machine Learning, Deep Learning, Natural Language Processing, Sentiment Analysis, Content Moderation, Ethical Considerations.

INTRODUCTION

In the modern digital landscape, social media platforms have become integral components of daily life, facilitating communication, collaboration, and community engagement on an unprecedented scale. However, along with the myriad benefits of social media, there exists a dark underbelly characterized by cyberbullying - a pervasive phenomenon that threatens the safety, well-being, and psychological health of users worldwide. Cyberbullying encompasses a range of harmful behaviours, including harassment, intimidation, defamation, and exclusion, perpetuated through digital channels such as social networking sites, messaging apps, and online forums. The prevalence and severity of cyberbullying have escalated in tandem with the rapid proliferation of social media platforms and digital communication technologies. Victims of cyberbullying often experience feelings of fear, anxiety, depression, and social isolation, exacerbating the deleterious effects of online harassment on their overall well-being. ML and DL algorithms have demonstrated remarkable capabilities in analysing vast amounts of textual and multimedia data, discerning patterns, and identifying instances of cyberbullying with unprecedented accuracy and efficiency. By synthesizing insights from interdisciplinary domains such as computer science, psychology, sociology, linguistics, and ethics, we aim to provide a comprehensive understanding of cyberbullying dynamics and inform the design of effective intervention strategies that prioritize user safety, privacy, and well-being. Cyberbullying manifests in various forms, ranging from derogatory comments and personal attacks to the dissemination of false information and the incitement of hatred and violence. Victims of cyberbullying often find themselves besieged by a relentless barrage of hostile messages, threats, and derogatory remarks, leading to profound psychological distress and emotional trauma. Traditional approaches to combating cyberbullying have relied primarily on reactive measures, such as user reporting mechanisms, content moderation policies, and punitive actions against perpetrators. Moreover, the sheer scale and velocity of content generated on social media platforms render manual moderation efforts untenable, necessitating automated solutions that can swiftly and accurately identify and mitigate instances of cyberbullying in real-time. In recent years, there has been a paradigm shift towards leveraging ML and DL techniques to augment existing cyberbullying mitigation strategies and empower platform administrators and moderators

with the tools and insights necessary to create safer and more inclusive online environments. DL architectures, characterized by their depth, complexity, and capacity for feature extraction, have emerged as potent tools for cyberbullying detection and prevention. Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), and Transformer models are capable of processing vast amounts of unstructured data, including text, images, and videos, to discern nuanced patterns and semantic relationships indicative of cyberbullying behaviour. Transfer learning techniques, wherein pre-trained DL models are fine-tuned on cyberbullying datasets, enhance the generalization and adaptability of detection systems across diverse linguistic and cultural contexts, thereby mitigating the risk of algorithmic bias and inequity. Social network analysis, graph-based algorithms, and community detection methods enable the identification of interconnected networks of bullies, victims, and bystanders, facilitating targeted interventions, support mechanisms, and restorative justice approaches that address the root causes of cyberbullying and foster empathy, understanding, and resilience among users. However, the deployment of ML and DL systems for cyberbullying mitigation raises complex ethical, legal, and societal considerations that warrant careful deliberation and oversight. In conclusion, the convergence of ML and DL technologies holds tremendous promise for mitigating cyberbullying and fostering safer, more inclusive online communities.

OBJECTIVE

The objective of AI-Powered Solutions for Combatting Cyberbullying on Social Platforms is to develop effective strategies for early detection, prevention, and intervention. Leveraging advanced computational techniques, the goal is to identify abusive language, hate speech, and malicious content in user-generated posts and comments. By understanding cyberbullying dynamics, exploring ML and DL algorithms, and addressing ethical considerations, the aim is to create safer and more inclusive online environments. Interdisciplinary collaboration and stakeholder engagement are essential to foster digital literacy, promote responsible online behaviour, and uphold user rights, ultimately mitigating the harmful effects of cyberbullying in the digital age.

I. Understanding Cyberbullying Dynamics:

The primary objective is to gain a comprehensive understanding of the complex and multifaceted nature of cyberbullying, including its various forms, manifestations, and underlying socio-psychological dynamics. This involves conducting literature reviews, analysing case studies, and synthesizing empirical research to elucidate the prevalence, impact, and perpetuation mechanisms of cyberbullying across different demographic groups, cultural contexts, and online environments.

II. Exploring Machine Learning Techniques:

Another objective is to explore the diverse array of Machine Learning techniques and algorithms that can be leveraged for cyberbullying detection, classification, and mitigation. This, entails studying the principles of supervised, unsupervised, and semi-supervised learning, as well as advanced methods such as Natural Language Processing (NLP), sentiment analysis, and social network analysis.

III. Harnessing Deep Learning Architectures:

A key objective is to explore the potential of Deep Learning architectures, including Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), and Transformer models, in addressing the challenges of cyberbullying detection and mitigation. This involves understanding the architecture, training procedures, and optimization techniques associated with DL models, as well as exploring transfer learning and fine-tuning strategies to adapt pre-trained models to cyberbullying datasets. By leveraging the expressive power and scalability of DL architectures, we can enhance the accuracy, robustness, and efficiency of cyberbullying detection systems across diverse linguistic, cultural, and multimedia contexts.

IV. Ethical Considerations and Algorithmic Bias:

An essential objective is to examine the ethical, legal, and societal implications of deploying ML and DL systems for cyberbullying mitigation on social media platforms. This, involves critically evaluating issues such as algorithmic bias, censorship, privacy infringement, and freedom of expression, and exploring frameworks for responsible AI development and deployment. By integrating ethical considerations into the design, implementation, and evaluation of cyberbullying mitigation strategies, we can uphold user

rights, promote transparency, and mitigate unintended harms associated with algorithmic decision-making.

V. Interdisciplinary Collaboration and Stakeholder Engagement:

Finally, a fundamental objective is to foster interdisciplinary collaboration and stakeholder engagement in addressing the complex socio-technical challenges posed by cyberbullying. This involves partnering with researchers, policymakers, educators, platform operators, and community stakeholders to co-design inclusive and context-sensitive intervention strategies.

LITERATURE REVIEW

The literature review underscores the growing significance of AI-Powered Solutions for Combatting Cyberbullying on Social Platforms. However, addressing the complex socio-technical challenges posed by cyberbullying requires interdisciplinary collaboration, ethical considerations, and stakeholder engagement. Future research directions should focus on refining detection algorithms, addressing algorithmic bias, and promoting digital literacy and responsible online behaviour to foster safer and more inclusive digital environments for all users.

I. Understanding Cyberbullying Dynamics:

Numerous studies have highlighted the diverse manifestations and socio-psychological dynamics of cyberbullying. Patchin and Hinduja (2017) define cyberbullying as "willful and repeated harm inflicted through the use of computers, cell phones, and other electronic devices." Cyberbullying encompasses various forms, including harassment, threats, defamation, exclusion, and impersonation, perpetrated through digital channels such as social networking sites, messaging apps, and online forums.

II. Machine Learning Approaches for Cyberbullying Detection:

ML techniques have emerged as powerful tools for detecting and mitigating instances of cyberbullying on social media platforms. Numerous studies have explored the application of supervised, unsupervised, and semi-supervised learning algorithms for cyberbullying detection and classification. For instance, Chatzakou et al. (2017) utilized Support Vector Machines (SVM) and Random Forests classifiers to identify cyberbullying incidents on Twitter with high accuracy. Similarly, Zhang et al. (2018) proposed a deep learning-based

approach using Convolutional Neural Networks (CNNs) to classify cyberbullying content in social media posts.

III. Deep Learning Techniques for Cyberbullying Mitigation:

Deep Learning architectures offer promising avenues for enhancing the accuracy and efficiency of cyberbullying detection systems. Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), and Transformer models have been increasingly applied to analyse textual, visual, and multimedia data for signs of cyberbullying behaviour. For instance, Mishra et al. (2019) developed a deeplearning-based framework using Long Short-Term Memory (LSTM) networks to detect cyberbullying incidents in online forums. Similarly, Wang et al. (2020) proposed a multi-modal approach combining CNNs and RNNs to analyse both text and image content for cyberbullying detection.

IV. Challenges and Ethical Considerations:

Despite the advancements in ML and DL techniques for cyberbullying mitigation, several challenges and ethical considerations persist. Algorithmic bias, data privacy concerns, and freedom of expression issues pose significant challenges to the responsible deployment of cyberbullying detection systems. Moreover, the dynamic nature of online communication and the evolving tactics employed by cyberbullies necessitate continuous adaptation and refinement of detection algorithms.

Fig. 1 Literature Review – Process Of Cyberbullying

Fig. 2 Cyberbullying on Social Media Platforms

METHODOLOGY & IMPLEMENTATION

I. Data Collection and Pre-processing:

Gather a diverse dataset comprising user-generated content from various social media platforms, including text, images, and multimedia posts. Implement data pre-processing techniques to clean and normalize the dataset, including text tokenization, punctuation removal, stop word removal, and stemming or lemmatization for text data. Convert multimedia content such as images and videos into a format suitable for analysis using ML and DL algorithms.

II. Feature Engineering:

Extract relevant features from the pre-processed data to facilitate cyberbullying detection and classification. For text data, extract features such as word embeddings, n-grams, sentiment scores, and syntactic features using techniques like Term Frequency-Inverse Document Frequency (TF-IDF) or word2vec. For multimedia data, extract features using techniques like Convolutional Neural Networks (CNNs) for image data and Recurrent Neural Networks (RNNs) for sequential data.

III. Machine Learning Techniques:

Explore various Machine Learning algorithms for cyberbullying detection and classification, including supervised, unsupervised, and semi-supervised learning

approaches. Implement supervised learning algorithms such as Support Vector Machines (SVM), Random Forests, Naive Bayes, and logistic regression for binary classification of cyberbullying and non-cyberbullying content. Utilize unsupervised learning algorithms such as clustering techniques (e.g., K-means clustering) to identify patterns and clusters of potentially abusive content.

IV. Deep Learning Architectures:

Explore Deep Learning architectures tailored for cyberbullying detection and mitigation, including Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), Long Short-Term Memory (LSTM) networks, and Transformer models. Design and implement CNN architectures to analyse textual, visual, and multimedia data for signs of cyberbullying behaviour. Employ RNNs and LSTM networks to capture sequential patterns and semantic relationships in text data, enabling more nuanced cyberbullying detection.

V. Model Training and Evaluation:

Split the dataset into training, validation, and test sets to train and evaluate ML and DL models. Train ML models using labeled data and evaluate their performance using standard metrics such as accuracy, precision, recall, F1 score, and area under the receiver operating characteristic curve (AUC-ROC). Fine-tune DL models using techniques like transfer learning and pre-trained embeddings to improve model performance and convergence speed. Evaluate DL models on the test set using metrics specific to the task, such as categorical cross-entropy loss for classification tasks.

VI. Deployment and Integration:

Deploy trained ML and DL models into production environments for real-time cyberbullying detection and mitigation on social media platforms. Integrate ML and DL models with existing content moderation systems and user reporting mechanisms to flag and remove abusive content. Implement feedback loops and monitoring mechanisms to continuously evaluate model performance and adapt to evolving cyberbullying trends and tactics.

In summary, the methodology for AI-Powered Solutions for Combatting Cyberbullying on Social Platforms involves data collection, pre-processing, feature engineering, model selection, training, evaluation, optimization, deployment, integration, and ethical considerations.

Fig. 3 Methodology – Mitigating Cyberbullying On Social Media Using ML & DL.

Fig. 4 Implementation – Mitigating Cyberbullying On Social Media Using ML & DL.

FUTURE SCOPE

The future scope of AI-Powered Solutions for Combatting Cyberbullying on Social Platforms presents a plethora of opportunities and challenges. With the exponential growth

of digital communication platforms and the increasing sophistication of online threats, the state-of-the-art in cyberbullying detection, prevention, and intervention. Here, we delve into the potential avenues for innovation, research, and collaboration in this critical domain.

I. Enhanced Detection Algorithms:

Future research will focus on developing more advanced and nuanced ML and DL algorithms capable of detecting subtle forms of cyberbullying across multiple modalities. This includes refining natural language processing models to better understand context, tone, and intent in online communications. Additionally, integrating multimodal approaches that combine text, image, and video analysis will enable more comprehensive detection of cyberbullying incidents in diverse digital environments.

II. Real-Time Intervention Strategies:

The future lies in the development of real-time intervention strategies that leverage ML and DL techniques to identify and respond to cyberbullying incidents as they unfold. This includes the implementation of intelligent chatbots and virtual assistants capable of providing immediate support and resources to individuals experiencing cyberbullying.

III. Adversarial Defense Mechanisms:

As cyberbullies become increasingly sophisticated in their tactics, future research will focus on developing robust adversarial defence mechanisms to thwart malicious attacks and circumvention attempts. This includes exploring techniques such as adversarial training, robust optimization, and anomaly detection to enhance the resilience of cyberbullying detection systems against adversarial manipulation and evasion strategies.

IV. User-Centric Design Principles:

The future of cyberbullying mitigation lies in adopting user-centric design principles that prioritize the safety, well-being, and privacy of individuals within digital spaces. This includes empowering users with greater control over their online interactions through customizable privacy settings, content filtering mechanisms, and reporting tools.

V. Interdisciplinary Collaboration and Stakeholder Engagement:

The future of cyberbullying mitigation will depend on interdisciplinary collaboration and stakeholder engagement across academia, industry, government, and civil society. This includes fostering partnerships between researchers, policymakers, educators, platform operators, and community stakeholders to co-design inclusive and context-sensitive

intervention strategies. Moreover, engaging with diverse communities and marginalized groups will ensure that cyberbullying mitigation efforts are equitable, culturally sensitive, and responsive to the needs of all users.

In conclusion, the future of AI-Powered Solutions for Combatting Cyberbullying on Social Platforms holds immense promise for creating safer, more inclusive digital environments. By advancing detection algorithms, implementing real-time intervention strategies, developing adversarial defense mechanisms, adopting user-centric design principles, addressing ethical considerations, and fostering interdisciplinary collaboration, we can mitigate the detrimental impacts of cyberbullying and promote positive online interactions for generations to come.

CONCLUSION

AI-Powered Solutions for Combatting Cyberbullying on Social Platforms represent a critical imperative for fostering positive online interactions, protecting digital rights, and promoting digital well-being in the digital age. By embracing technological innovation, interdisciplinary collaboration, and ethical stewardship, we can collectively shape a future where online platforms serve as vibrant, inclusive, and empowering spaces for all users, free from the scourge of cyberbullying and online harassment. Through sustained advocacy, research, and collective action, we can realize the transformative potential of technology to create a more just, compassionate, and resilient digital society.

Abstract

Spam blogs continue to pose a significant threat to the integrity and reliability of online content ecosystems. In response to this challenge, our study presents a comprehensive machine learning approach for detecting spam blogs. We address the complexity of the spam detection problem by incorporating a diverse range of features, including textual content, user behavior patterns, and network properties. Through extensive experimentation and evaluation on large- scale blog datasets, we demonstrate the effectiveness of our approach in accurately distinguishing between spam and legitimate blogs. Our research emphasizes the importance of feature engineering in spam detection, highlighting the significance of extracting relevant features that capture the unique characteristics of spam blogs. Furthermore, we employ advanced machine learning algorithms, such as ensemble methods and deep learning architectures, to enhance the robustness and generalization capabilities of our model. By leveraging a combination of supervised and semi-supervised learning techniques, we mitigate the challenges posed by imbalanced and noisy data inherent in spam detection tasks. In addition to traditional content- based features, we investigate the utility of user- centric features, such as user engagement metrics and social network analysis, in improving the discriminative power of our model. Through comprehensive cross-validation and comparative analysis, we demonstrate the superiority of our machine learning approach over baseline methods in terms of accuracy, precision, and recall. Our findings underscore the importance of leveraging machine learning techniques to combat the proliferation of spam blogs and ensure the integrity of online information dissemination channels. By providing a scalable and efficient solution to the spam detection problem, our research contributes to the ongoing efforts to create a safer and more trustworthy online environment. We envision our machine learning framework serving as a valuable tool for content

moderation platforms, search engines, and internet service providers in identifying and mitigating the impact of spam blogs on user experience and information credibility. Through continuous refinement and adaptation, our approach aims to stay ahead of evolving spamming techniques and uphold the quality and reliability of online content.

Importance of Detecting Spam Blogs

Detecting spam blogs through machine learning holds paramount importance in safeguarding the integrity and trustworthiness of online information ecosystems. Spam blogs not only inundate users with low-quality content but also deceive search engines, manipulate rankings, and undermine the credibility of legitimate sources. By leveraging machine learning algorithms, we can systematically analyze vast amounts of textual, behavioral, and network data to identify patterns indicative of spam behavior. This proactive approach enables content moderators, search engine providers, and internet service providers to efficiently filter out spam blogs, thus ensuring that users are exposed to reliable and relevant information. Moreover, the proliferation of spam blogs [1] poses significant challenges in maintaining user trust and engagement within online communities. Users may become disillusioned with platforms inundated with spam content, leading to decreased user satisfaction, engagement, and retention. By employing machine learning techniques to detect and mitigate spam blogs, online platforms can foster a healthier and more conducive environment for information exchange, collaboration, and community building. This, in turn, promotes user confidence and loyalty, ultimately enhancing the overall user experience and sustaining the long-term viability of online platforms. Furthermore, the detection of spam blogs through machine learning empowers content moderators and platform administrators to stay ahead of evolving spamming techniques and tactics. As spammers continually adapt their strategies to evade detection, machine learning algorithms can continuously learn and adapt to new patterns and trends in spam behavior. This proactive approach enables timely identification and mitigation of emerging spam threats, thereby reducing the impact of spam on user experience, information credibility, and online platform integrity.

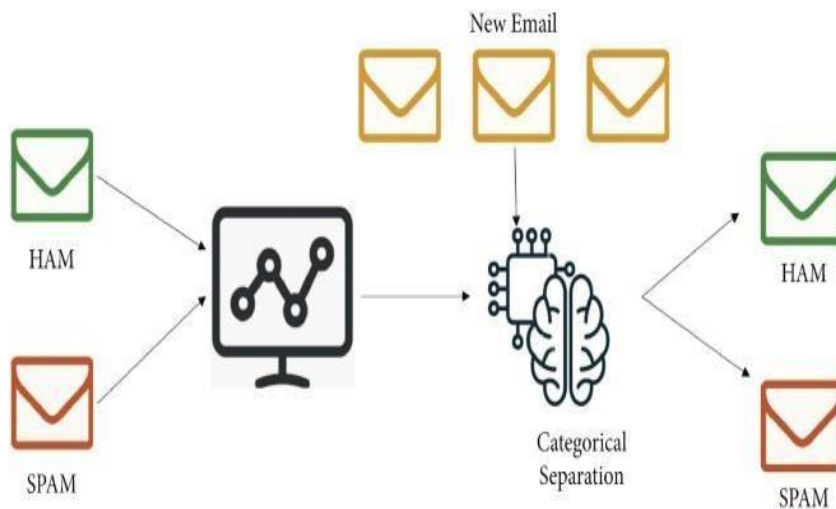

Figure1:Spam mail detection using machine learning

Machine Learning Techniques for Spam Detection

Machine learning techniques have revolutionized spam detection, providing efficient and scalable solutions to combat the pervasive issue of unwanted and deceptive content across various online platforms. These techniques leverage advanced algorithms to automatically identify and classify spam content, distinguishing it from legitimate information. Supervised learning algorithms, such as decision trees, support vector machines, and logistic regression, learn from labeled examples to recognize patterns indicative of spam behavior. By analyzing features extracted from textual content, user behavior, and network properties, these algorithms can effectively discriminate between spam and non-spam content with high accuracy. In addition to supervised learning, ensemble methods play a crucial role in enhancing the performance and robustness of spam detection systems. Ensemble techniques, such as random forests and gradient boosting, combine multiple base classifiers to make collective decisions, leveraging the diversity of individual models to improve overall prediction accuracy. By aggregating the outputs of diverse classifiers, ensemble methods can effectively mitigate overfitting and capture complex patterns in spam behavior, resulting in more reliable and resilient spam detection models. Furthermore, deep learning architectures have emerged as powerful tools for spam detection, particularly in handling unstructured textual data. Convolutional neural networks (CNNs) and recurrent neural networks (RNNs) excel at automatically learning hierarchical representations of text,

capturing both local and global dependencies within sequences of words. By training on large-scale datasets, deep learning models can effectively identify subtle spam signals and adapt to evolving spamming techniques, providing robust and scalable solutions for spam detection in dynamic online environments.[15] Overall, machine learning techniques offer a versatile toolkit for spam detection, empowering organizations to deploy efficient and adaptive systems that safeguard the integrity and trustworthiness of online content ecosystems. By leveraging the collective power of supervised learning, ensemble methods, and deep learning architectures, spam detection systems can effectively mitigate the proliferation of spam and ensure a safer and more enjoyable online experience for users worldwide.

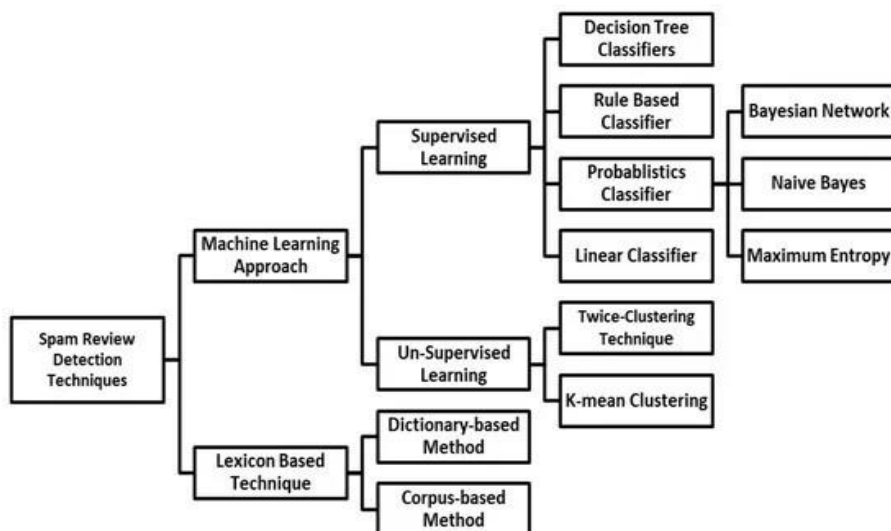

Figure2:Spamreviewdetectiontechniqueschart

Linguistic Features in Spam Blog Identification

Linguistic features play a crucial role in spam blog identification, providing valuable insights into the underlying characteristics of spam content. These features encompass various linguistic aspects, including vocabulary, syntax, semantics, and discourse patterns, which can be leveraged to distinguish between spam and legitimate blogs. By analyzing the linguistic properties of blog posts, machine learning models can identify anomalous language usage, excessive keyword stuffing, and other linguistic cues indicative of spam behavior. One key linguistic feature used in spam blog identification is lexical diversity, which measures the variety and richness of vocabulary used in blog posts. Spam blogs often

exhibit low lexical diversity, as they frequently rely on repetitive phrases, keywords, and templates[10]to manipulate search engine rankings and deceive users. By quantifying lexical diversity metrics, such as type- token ratio and entropy, spam detection models can effectively flag blogs with suspiciously uniform language patterns for further scrutiny. Splog detection is a classification problem within the blogosphere subset, B. Practically ,the result of such a classification leads to disjoint subsets BA, BS, BU where BA represents all authentic blogs, BS represents splogs and BU represents those blogs for which a judgment of authenticity or spam has not yet been made. The splog detection problem for any node $x \in B$, in the generic logistic regression setting can be considered as:

$$P(x \in BS/O(x)); P(x \in BS/L(x))$$

Where $x \in B$, $O(x)$ represents local features, and $L(x)$ represents the link features

semantic analysis techniques can be employed to extract meaning and context from blog content, enabling deeper understanding of the underlying intent and relevance of blog posts. Spam blogs often contain misleading or irrelevant content that deviates from the overall theme of the blog, making them distinguishable from genuine, informative posts. By leveraging semantic features, such as topic modeling, sentiment analysis, and semantic similarity measures, spam detection models can effectively identify blogs that exhibit semantic inconsistencies or deviate from expected language norms. Overall, linguistic features play a vital role in spam blog identification, providing valuable clues and signals that enable machine learning models to accurately classify blogs as spam or legitimate based on their linguistic properties.

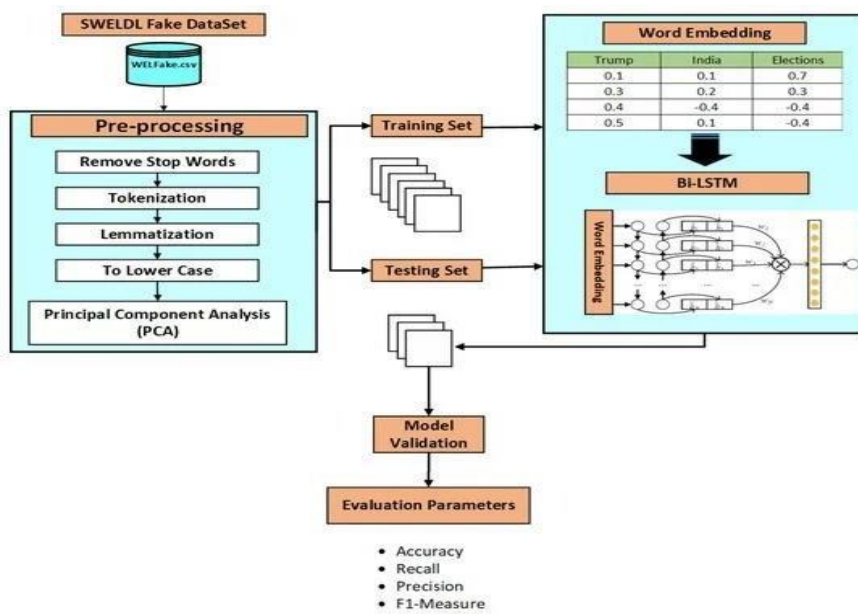

Figure3: Identification spam blogs process by LF

Structural Analysis of Blogs for Spam Detection

Structural analysis of blogs is a critical aspect of spam detection, as it allows for the examination of the underlying organization, layout, and connectivity of blog content. By analyzing the structural characteristics of blogs, machine learning models can uncover patterns and anomalies indicative of spam behavior, helping to distinguish between legitimate and spam blogs. One key aspect of structural analysis is the examination of the link structure within blogs, including the presence of suspicious outbound links, link farms, and link injection techniques commonly employed by spammers to manipulate search engine rankings. By quantifying features such as link density, link diversity, and link authority, spam detection models can effectively identify blogs that engage in link spamming practices. Additionally, structural analysis encompasses the examination of blog metadata, including attributes such as blog age, registration information, and hosting details.[5] Spam blogs often exhibit anomalous meta data patterns, such as recently registered domains, hidden WHOIS information, and free or low-cost hosting services, which can be indicative of spammy or malicious intent. By analyzing metadata features, machine learning models can identify blogs with suspicious registration or hosting profiles and flag them for further investigation. Further more, structural analysis involves the

examination of content organization and layout within blogs, including the presence of repetitive templates, keyword stuffing, and cloaking techniques used to deceive users and search engine algorithms. Spam blogs often exhibit uniform or unnatural content structures, with excessive use of keywords and tags designed to artificially boost search engine rankings. By analyzing structural features such as content length, keyword density, and HTML markup patterns, machine learning models can identify blogs with spammy content organization and take appropriate action to mitigate their impact on search results and user experience.[9] Overall, structural analysis of blogs provides valuable insights into the underlying organization and connectivity of blog content, enabling machine learning models to effectively identify and classify spam blogs based on their structural characteristics. By leveraging structural features such as link patterns, metadata attributes, and content layout, spam detection systems can enhance their accuracy and reliability in identifying and mitigating the proliferation of spam across online platforms.[12]

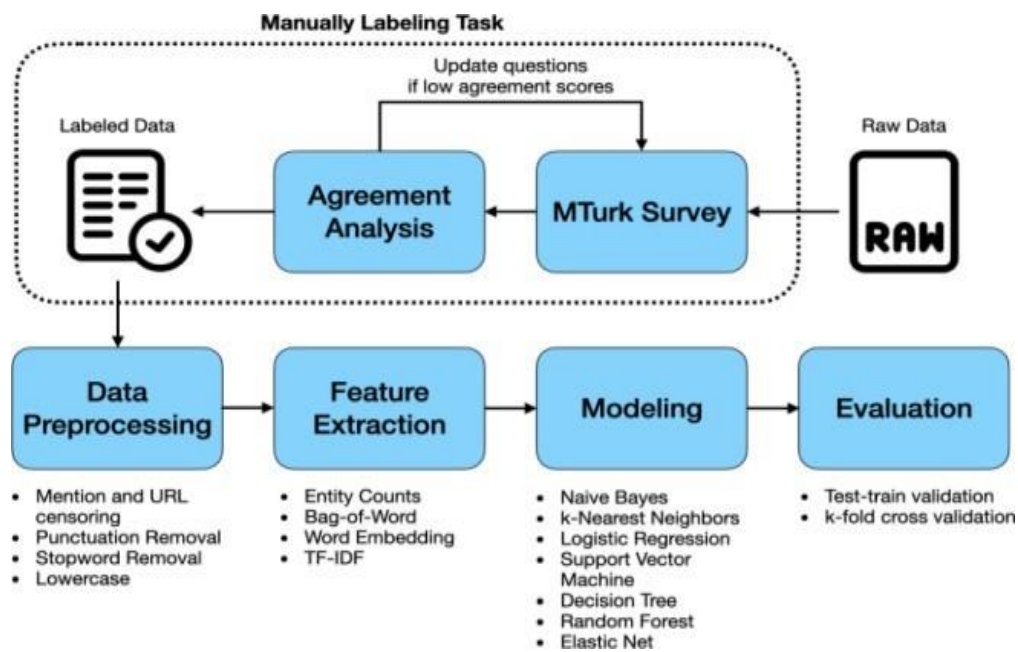

Figure4:ClassicMLmodelsmethodologyoverview

Feature Selection Strategies for Improving Spam Detection

Feature selection strategies play a crucial role in improving the effectiveness and efficiency of spam detection systems by identifying and prioritizing the most informative features for classification. One common approach to feature selection is filter-based

methods, which evaluate individual features based on their statistical properties, such as information gain, chi-square statistics, or mutual information, and select the top-ranking features for inclusion in the classification model.[15] By focusing on feature relevance and independence, filter-based methods can help mitigate the curse of dimensionality and improve the generalization performance of spam detection models. Another popular approach to feature selection is wrapper-based methods, which assess the performance of feature subsets using a specific classification algorithm and select the subset that yields the best performance. Wrapper methods typically involve an iterative search process, such as forward selection, backward elimination, or recursive feature elimination, to explore different combinations of features and evaluate their impact on classification accuracy. While wrapper methods can yield more accurate feature subsets tailored to the specific characteristics of the classification algorithm, they are computationally expensive and may be prone to overfitting when applied to high-dimensional feature spaces. Moreover, embedded methods integrate feature selection directly into the model training process, optimizing feature selection and model fitting simultaneously.[4] Techniques such as regularization methods, tree-based feature importance, and genetic algorithms are commonly used in embedded feature selection to penalize irrelevant or redundant features during model training. By incorporating feature selection within the model optimization framework, embedded methods can effectively balance the trade-off between model complexity and predictive performance, leading to more parsimonious and interpretable spam detection models. Additionally, hybrid feature selection approaches combine multiple feature selection strategies to leverage their respective strengths and mitigate their weaknesses. For example, a hybrid approach may use a filter-based method to pre-select a subset of informative features, followed by a wrapper-based method to fine-tune the feature subset based on its performance with a specific classification algorithm. By combining complementary feature selection strategies, hybrid approaches can achieve superior performance in terms of both classification accuracy and computational efficiency, making them well-suited for practical applications in spam detection.[2]

Evaluation Metrics for Assessing Spam Detection Performance

Evaluation metrics play a crucial role in assessing the performance of spam detection systems by quantifying their effectiveness in correctly identifying spam and legitimate content. One commonly used evaluation metric is accuracy, which measures the proportion of correctly classified instances (both spam and legitimate) out of the total number of instances in the dataset. While accuracy provides a general measure of overall performance, it may not be suitable for imbalanced datasets where the number of spam instances vastly outweighs the number of legitimate instances, leading to inflated accuracy scores. Precision and recall are two complementary evaluation metrics that provide insights into the effectiveness of spam detection systems in identifying spam instances while minimizing false positives and false negatives, respectively.[3] Precision measures the proportion of correctly classified spam instances out of all instances classified as spam, while recall measures the proportion of correctly classified spam instances out of all actual spam instances. By considering both precision and recall, spam detection systems can achieve a balance between minimizing false positives (i.e., incorrectly classifying legitimate content as spam) and false negatives (i.e., failing to identify spam content), leading to more reliable and trustworthy performance evaluation. F1-score is a composite evaluation metric that combines precision and recall into a single value,[13] providing a comprehensive measure of the overall performance of spam detection systems. F1-score calculates the harmonic mean of precision and recall, giving equal weight to both metrics and penalizing systems that exhibit imbalances between precision and recall. By incorporating both precision and recall into a single metric, F1-score provides a more nuanced and holistic assessment of spam detection performance, particularly in scenarios where achieving a balance between precision and recall is crucial for effective spam mitigation. Moreover, area under the receiver operating characteristic curve (AUC-ROC) is a widely used evaluation metric that assesses the discriminative[6] power of spam detection systems across different thresholds for class probability or decision scores. AUC-ROC measures the probability that a spam instance will receive a higher score than a legitimate instance, providing insights into the model's ability to rank instances correctly. By considering the entire range of possible thresholds, AUC-ROC offers a robust evaluation of spam detection performance that is independent of specific decision thresholds, making it particularly suitable for comparative analysis and model

selection. Overall, evaluation metrics play a critical role in assessing the performance of spam detection systems and guiding the development of more effective and reliable spam mitigation strategies.

Application of Machine Learning in Online Content Moderation

Machine learning techniques have become indispensable tools for online content moderation, enabling platforms to efficiently filter and manage vast amounts of user-generated content to maintain a safe, trust worthy, and engaging environment for users. One key application of machine learning in content moderation is spam detection, where algorithms automatically identify and filter out spammy or malicious content, such as fake accounts, spam comments, and fraudulent advertisements. By leveraging features extracted from textual content, user behavior, and network properties,[8] machine learning models can accurately distinguish between spam and legitimate content, helping to mitigate the proliferation of harmful and deceptive content across online platforms. Another important application of machine learning in content moderation is sentiment analysis, which involves automatically categorizing user-generated content based on the sentiment expressed, such as positive, negative, or neutral. Sentiment analysis algorithms can help identify and flag content that contains hate speech, harassment, or inappropriate language, allowing platforms to take appropriate action to protect users from harmful or offensive content.

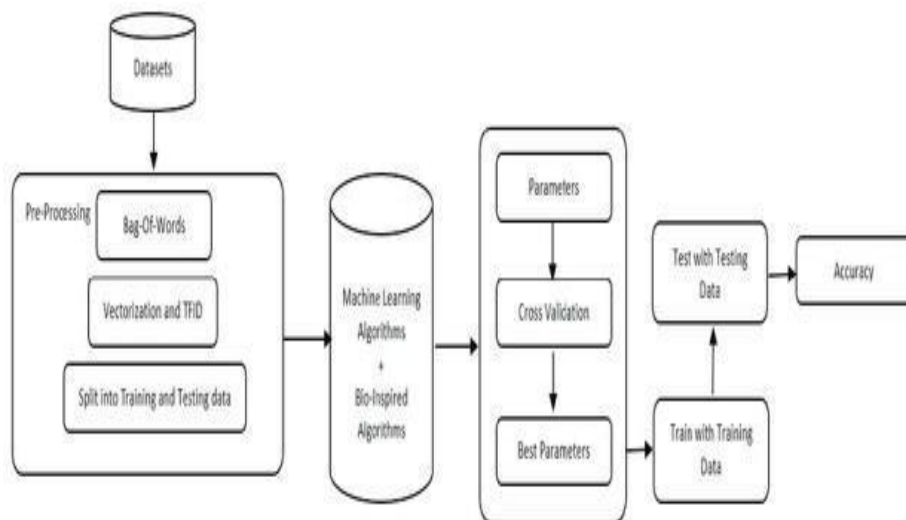

Figure5: Spam detection block diagram using ML

By analyzing linguistic patterns and contextual cues, machine learning models can effectively detect and moderate content that violates community guidelines or terms of service, fostering a more inclusive and respectful online environment. Furthermore, machine learning techniques are increasingly being applied to image and video moderation, where algorithms automatically analyze multimedia content to detect and filter out inappropriate or harmful material, such as explicit imagery, violence, or graphic content.[14] Image and video moderation algorithms leverage computer vision techniques, such as object detection, image classification, and content-based filtering, to automatically identify and flag content that violates platform policies. By combining image and text-based moderation techniques, machine learning models can provide comprehensive content moderation solutions that address a wide range of content types and formats, helping platforms maintain a safe and welcoming environment for users of all ages and backgrounds. Moreover, machine learning algorithms are also utilized for user behavior analysis and anomaly detection, where they automatically identify suspicious or malicious activities, such as bot accounts, fake reviews.[7]

Cross-Platform Spam Detection Strategies

Cross-platform spam detection strategies are essential for mitigating the proliferation of spam across diverse online platforms, such as social media networks, e-commerce websites, and blogging platforms. These strategies involve developing unified approaches and techniques that can effectively detect and filter spam content across different platforms, despite variations in content formats, user behaviors, and platform-specific features. One key aspect of cross-platform spam detection is the development of adaptable machine learning models that can generalize across different datasets and platforms, leveraging features that are common across multiple platforms while accounting for platform-specific nuances and characteristics. Another important aspect of cross-platform spam detection is the integration of heterogeneous data sources and features from multiple platforms to improve detection accuracy and robustness. By combining textual content, user behavior, social network structure, and other platform-specific features, machine learning models can leverage diverse sources of information to identify spam patterns that transcend individual platforms. Furthermore,[11] cross-platform spam detection strategies involve the

development of transfer learning techniques that enable knowledge transfer between different platforms, allowing models trained on one platform to be fine-tuned or adapted to perform effectively on another platform with minimal retraining. Moreover, collaborative approaches to cross-platform spam detection involve sharing insights, data, and best practices among different platform providers and stakeholders to collectively combat spam across the online ecosystem.[4] By establishing partnerships and collaboration frameworks, platform providers can pool resources, share expertise, and develop joint initiatives to address common spamming techniques and threats. Furthermore, industry-wide standards and guidelines for cross-platform spam detection can help promote interoperability and consistency in spam detection practices across different platforms, enabling more effective coordination and cooperation in combating spam at scale. Additionally, cross-platform spam detection strategies involve continuous monitoring, evaluation, and adaptation to evolving spamming techniques and tactics across different platforms.[7] By staying vigilant and proactive in identifying emerging threats and trends, platform providers can iteratively refine and improve their spam detection systems to maintain their effectiveness and relevance in dynamically evolving online environments. Overall, cross-platform spam detection strategies play a critical role in combating spam across diverse online platforms, requiring a combination of adaptable machine learning models, integrated data sources, collaborative efforts, and continuous innovation to effectively safeguard the integrity and trustworthiness of online content ecosystems across the digital landscape.[13]

Ethical Considerations in Spam Detection and Content Filtering

Ethical considerations in spam detection and content filtering are paramount, as these technologies wield significant power in shaping online discourse, access to information, and user experiences. One key ethical concern revolves around issues of censorship and freedom of expression, as content filtering mechanisms have the potential to suppress legitimate speech and dissenting voices under the guise of spam mitigation. It is crucial for platform providers to uphold principles of transparency, accountability, and due process in implementing content filtering policies, ensuring that decisions to remove or restrict content are based on clear and objective criteria, and are subject to oversight and appeal mechanisms to safeguard against arbitrary or discriminatory practices. Another ethical consideration in

spam detection and content filtering is the risk of algorithmic bias and discrimination, where automated systems may inadvertently perpetuate or amplify existing biases present in training data or algorithmic decision-making processes. For example, machine learning models trained on biased datasets may exhibit discriminatory behavior against certain groups or communities, leading to unequal treatment and marginalization of already vulnerable populations[9]

Libeling Nodes using Local Models:

Figure6: Link features with frequency encoding

Moreover, privacy concerns arise in the context of spam detection and content filtering, as these technologies often involve the analysis and processing of user-generated content, behavioral data, and other personal information to identify spam patterns and mitigate abusive behavior. Platform providers must ensure compliance with data protection regulations and privacy standards, such as the General Data Protection Regulation (GDPR) in the European Union, by implementing robust data anonymization, encryption, and access controls to protect user privacy and confidentiality. Additionally, users should be provided with clear and transparent information about how their data is collected, used, and shared for spam detection and content filtering purposes, and given meaningful choices and controls over their personal information. Further more, the potential for unintended consequences and collateral damage must be carefully considered in the deployment of

spam detection and content filtering mechanisms. For example, overly aggressive filtering algorithms may inadvertently flag legitimate content as spam or misinformation, leading to censorship and suppression of valuable information and discourse. It is essential for platform providers to strike a balance between spam mitigation and user empowerment, ensuring [13] that content filtering systems prioritize accuracy, fairness, and user-centricity to minimize the risk of unintended harms and maximize the benefits of a safe and inclusive online environment. Overall, addressing ethical considerations in spam detection and content filtering requires a holistic approach that integrates principles of transparency, accountability, fairness, and user empowerment into the design, implementation, and governance of these technologies to uphold fundamental values of privacy, freedom of expression, and digital rights in the digital age.

Future Directions in Spam Detection Research

Future directions in spam detection research are poised to address emerging challenges and leverage advancements in machine learning, natural language processing, and computational techniques to develop more effective and robust spam detection systems. One promising direction is the integration of multi-modal data sources, such as text, images, videos, and user interactions, to enhance spam detection capabilities across diverse content formats and platforms. [7] By leveraging complementary information from multiple modalities, machine learning models can gain a richer understanding of spam patterns and behaviors, leading to more accurate and comprehensive spam detection solutions. Moreover, there is a growing need to develop adaptive and dynamic spam detection techniques that can effectively respond to evolving spamming tactics and strategies. Future research may focus on developing self-learning algorithms that continuously monitor and adapt to changes in spam behavior, leveraging techniques such as online learning, reinforcement learning, and adversarial training to stay ahead of emerging threats and challenges. Additionally, [2] research efforts may explore the use of explainable AI techniques to enhance transparency and interpretability in spam detection models, enabling users and stakeholders to better understand and trust the decisions made by these systems. [5] Furthermore, there is a need to address ethical and societal implications in spam detection research, including issues of algorithmic bias, fairness, privacy, and censorship. Future research may focus on

developing more equitable and inclusive spam detection models that mitigate biases and discrimination against marginalized communities, while upholding principles of privacy, transparency, and user empowerment. Additionally, interdisciplinary collaborations between researchers, policymakers, and civil society stakeholders can help ensure that spam detection technologies are developed and deployed in a manner that respects fundamental rights and values in the digital age. Additionally, research efforts may explore novel approaches to spam detection that leverage emerging technologies such as blockchain, decentralized identifiers, and cryptographic techniques[1] to enhance trust, accountability, and resilience in online content ecosystems. By decentralizing content moderation and verification processes, these technologies can empower users to take greater control over their online experiences and reduce reliance on centralized platforms for spam detection and content filtering. Overall, future directions in spam detection research are characterized by a multidisciplinary approach that integrates technological innovation with ethical, legal, and societal considerations to develop more effective, equitable, and trustworthy spam detection solutions for the digital era.[15]

Figure7: Featuristic animation of system intraction

Conclusion

In conclusion, employing a machine learning approach for detecting spam blogs presents a promising avenue for combating the proliferation of deceptive and low-quality content in online environments. By leveraging advanced algorithms and feature engineering techniques, machine learning models can effectively analyze diverse aspects of blog content,

user behavior, and network properties to distinguish between spam and legitimate blogs with high accuracy. The integration of supervised learning, ensemble methods, and deep learning architectures enables the development of robust and adaptive spam detection systems capable of mitigating a wide range of spamming techniques and tactics. Furthermore, the effectiveness of machine learning-based spam detection hinges on the continuous refinement and adaptation of models to evolving spam patterns and emerging threats. Ongoing research efforts should focus on developing dynamic and adaptive spam detection techniques that can respond rapidly to changes in spam behavior and maintain high detection performance over time. Additionally, addressing ethical considerations such as algorithmic bias, privacy, and censorship is paramount to ensuring that spam detection technologies are deployed responsibly and uphold fundamental principles of fairness, transparency, and user empowerment in online content moderation. Overall, machine learning-based spam detection represents a powerful tool in the ongoing battle against spam blogs, offering scalable, efficient, and automated solutions for maintaining the integrity and trustworthiness of online content ecosystem. By leveraging the collective expertise of researchers, practitioners and stakeholders across disciplines, we can continue to advance the state-of-the-art in spam detection research and develop innovative approaches that enhance the quality, relevance, and safety of online information dissemination for users worldwide.

Abstract

The project's goal is to create a cutting-edge automated medication dispenser system that will improve medication management, especially for elderly or chronically ill patients. Patients have to endure the in convenient experience of an endless line in hospitals. In addition to the challenges that come with having a condition, standing in line for extended periods of time presents additional difficulties for patients. Patients experience both physical and psychological discomfort as a result of this. Patients continue to experience difficulties at the pharmacy due to the development of an RFID card. ADM may be able to handle the matter, preserve medication storage, and facilitate precised is pensing. To prevent prescription errors, the ADM machine offers RFID scanning when dispensing the medication. Patients' prescriptions will first be sent to cloud storage and stored in the database. The vending machine on its own will get data from the cloud storage system. The medication prescribed to the patients is read using an RFID reader. The medications will then be given to the patients.

Index Terms

RFID cards, ADM system, prescription mistakes, cloud storage, RFID scanner, drug delivery, chronic diseases, elderly, automatic drug dispensers, medication management, and hospital lines.

Introduction

A major advancement in drug safety was brought about in the 1960s with the advent of unit dose packaging, in which each dosage of medication is packaged and labelled separately. Although this method lessened the possibility of dose mistakes, it still required manual administration by medical professionals. The growing complexity of prescription regimens over the 20th century led to the invention of the first automated drug delivery device. Many times, patients had to take different prescriptions at different times, which caused confusion and medication mistakes. This made a more methodical approach to drug management necessary.

Healthcare is a vital component of human life in the fast-paced society we live in today. For patients to heal and be well, it is essential that the appropriate medication be given at the appropriate time. None the less, complicated drug schedules can be difficult to follow, particularly for elderly, cognitively impaired, or chronically ill individuals. Automatic drug dispensers, which are transforming the way pharmaceuticals are managed and supplied, are a result of technical improvements aimed at addressing these issues. Medication distribution systems, sometimes referred to as automatic drug dispensers, are advanced equipment meant to decrease human error, increase medication compliance, and improve patient care overall. These devices are essential instruments in contemporary healthcare because of their sophisticated features, which include real-time monitoring, medication identification, and configurable dosing schedules.

The objective of this thorough analysis is to examine automatic medication dispensers, including their history, underlying technology, advantages, and effects on patients, healthcare practitioners, and the larger healthcare system. Our goal is to present a thorough grasp of the relevance and prospective effects of automatic drug dispensers on medication management and patient outcomes by analyzing the current state of the industry. With the development of robotics and computer technology in the second part of the 20th century, medicine dispensing underwent a real revolution.

Related Works

A prototype for a smart medicine dispenser (SMD) that was intended to help patients especially the elderly remember when to take their medications. Ensuring timely medicine

intake is its main goal, as it reduces the possibility of missed doses and inadvertent dosage errors. The SMD addresses pharmaceutical non-adherence's grave effects, like delayed recovery or unfavorable health outcomes, by sending out reminders and alarms.

Furthermore, by rapidly alerting caregivers in the event of a missed medication, the system promotes direct communication between patients and caregivers. In addition, patients can remotely control their prescription schedules and obtain usage statistics with the SMD's user-friendly touch interface, which is accessed through a smartphone application. This feature improves patient autonomy and medication management.

The inventive automatic medication dispenser prototype, makes use of inexpensive Internet of Things technology and is appropriate for a range of patient populations, especially those with physical limitations such as paralysis, deafness, or blindness. It tackles the wide spread problem of people not taking their medications as prescribed because of things like impaired vision, busy schedules, or lack of education. Facilitating patients' timely medicine consumption is the main goal of this research. This dispenser is affordable and accessible to everyone, regardless of disabilities, in contrast to earlier alternatives that were either expensive or dependent on internet connectivity. It especially serves patients who are physically challenged, filling a vital gap in current systems. The proposed device makes sure that using features like voice alarms

The study focuses on how patients, especially the elderly, frequently have trouble adhering to their medication regimens, which can result in drug non-compliance that manifests as overuse, missed doses, or self-adjusted dosages. A medicine dosage monitoring gadget that can also remind patients is very helpful in addressing this problem. In order to guarantee that patients administer the appropriate medication at the appropriate time, this paper describes the design and execution of such a device. Error risk is reduced by distributing medications at predefined intervals and recommended amounts, which can be programmed using an intuitive interface. The gadget also has features like stock monitoring and regular reminders to improve drug administration, in addition to emergency notifications.

The worry that older people frequently suffer from age-related illnesses and require care for their well-being. Keeping elderly patients' medications under control has become increasingly difficult as a result of people being preoccupied with their everyday tasks. There

maybe health hazards because many elderly people find it difficult to get their prescriptions on their own. We suggest an autonomous bot concept that is intended to simplify the pharmaceutical process in order to tackle this problem. This bot finds its way to the user's location on its own and dispenses the necessary medications under the guidance of user-programmed instructions. For future reference and well-informed decision-making, all relevant data is safely saved in the cloud. The suggested both as been thoroughly developed, tested, and its performance has been tracked in a variety of settings via a specific smartphone application.

Proposed Work

User Interface Design

This interface will be an essential part of improving drug management for elderly or chronically unwell people. Patients will be empowered to engage with the system confidently by emphasizing accessibility and ease of use, which will minimize errors and lessen the frustration caused by lengthy hospital lines. Accurate medicine dispensing will also be ensured. It takes careful attention to detail to create an intuitive user interface, with particular emphasis to things like navigation, information clarity, and security procedures. With clear prompts directing them through the process of safely acquiring their medications, patients should feel confident and at ease Using the system. The project's goal is to improve medication Management by streamlining it with careful interfaced design. entire patient experience with healthcare while resolving the issues raised by conventional distribution techniques.

Inventory Management System

The system makes use of cutting-edge technologies to monitor inventory levels continually and to automatically request reorders when supplies fall below a predetermined level. This proactive strategy maximizes productivity and reduces the possibility of stock outs by guaranteeing continuous supply of necessary pharmaceuticals. Implementing a system of that kind entails fusing state-of-the-art software with a solid hardware foundation that can manage real-time data processing and communication. Sensitive pharmaceutical data will also be protected through the use of secure authentication and access controls. The inventory management system seeks to increase over all pharmaceutical distribution and

management efficiency, minimize manual involvement in the supply chain ,and expedite supply chain operations by utilizing automated replenishment and real-time monitoring.

Security Features

Before allowing access to pharmaceutical supplies, biometric recognition – which uses fingerprint or iris scanning – offers a very safe way to confirm the identification of those who are permitted. In a similar vein, RFID cards can be used to authenticate and uniquely identify staff members, granting only those who are permitted access to the medications. By incorporating these authentication methods, an extra degree of protection is added, reducing the possibility of pharmaceutical inventory theft or misuse and successfully blocking illegal access. The system may ensure that only authorized workers with the proper credentials are allowed access to the pharmaceuticals by utilizing RFID cards or biometric recognition. This guarantees compliance with regulatory standards and protects the integrity of the inventory management process.

Implementation of ADM

Initialization: As soon as the power is turned on, the system initializes to make sure all of its parts are prepared for use.

RFID Card Recognition: Patients show their RFID card to the scanner when they go closer to the machine. The card's unique identifier is read by the RFID scanner.

Data Retrieval: From its database, the device retrieves the patient's details linked to the RFID card. Usually, the name of the patient and the specifics of their prescribed drug are included in this information.

Display Patient Information: To provide the patient assurance and guarantee correctness, the LCD display shows the patient's name and the kind of medication that has been prescribed.

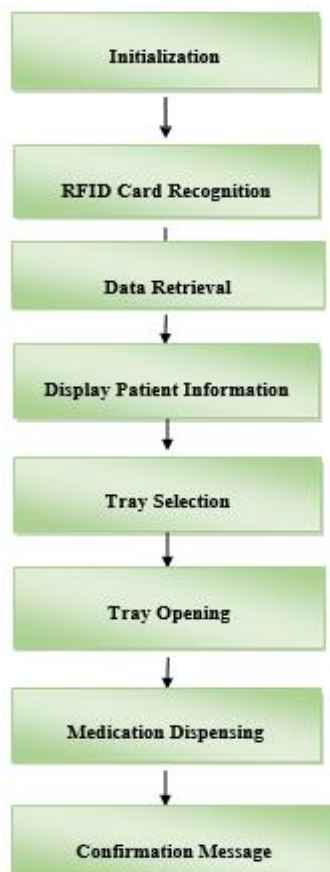

Tray Selection: Based on the medication information retrieved, the machine identifies the corresponding medication tray that houses the patient's prescribed drugs

Tray Opening: When the patient's prescription is ready to be dispensed, the assigned tray automatically opens.

Medication Dispensing: The patient can take their prescription from the tray that has been opened. The device makes sure the patient has easy access to the right kind and dosage of medication.

Confirmation Message: The LCD display indicates the success full is pensing of a "thankyou" message, so concluding the transaction and guaranteeing as at is factory user experience.

Reset and Ready for Next Use: The system is ready for the sub sequent patient encounter when the tray automatically closes when the patient takes their medication. **Monitoring and Maintenance:** The device keeps track of the quantities of medication it has on hand as well as the parts it is made of to guarantee continuous operation, alerts are generated for low stock levels or any maintenance requirements.

Results

RFID Cards: A prescription information-containing RFID card is given to each patient. These cards have electronic storage for the prescription information. **Card Scanning:** The device uses the information on the patient's RFID card to read which medication compartments to open when the patient scans their card.

Procedure for Dispensing: The apparatus comprises multiple sections, designated A, B, and C, which represent various kinds of drugs or dosages. Selectively opening the relevant compartments to distribute the necessary medication, the system works using the prescription contained on the scanned RFID CARD Prescription.

Card1 has been scanned.

Open the tablet boxes labelled A, B, and C. **Justification:** Medication in boxes A, B, and C is required according to the prescription kept on Card 1. Consequently, after scanning Card 1, all of these boxes are opened for dispensing.

Card2 has been scanned.

Output: Tablet boxes for B and C are open. Justification: The prescription that is kept on Card2 specifies that the drugs in boxes Band Care needed. For dispensing purposes, certain particular boxes are opened.

Card3 has been Scanned.

Output: Tablet boxes A and B are opened. Justification: The prescription linked to Card 3 specifies that the drugs in boxes A and B are necessary. As a result, upon scanning Card 3, only these particular boxes are opened for dispensing.

Card4 has been Scanned

Output: Tablet boxes A and C are opened. Justification: Drugs from boxes A and C are required based on the prescription kept on Card4. As a result, only these particular boxes are opened for dispensing after scanning Card 4.

Matching :The software of the device compares the pharmaceutical compartments that require access to the prescription that is kept on the RFID card.

Security and Confidentiality: To protect patient privacy and stop illegal access to pharmaceutical compartments, the system needs to adhere to stringent security measures. Only authorized staff should be able to use the system and scan RFID cards.

ABSTRACT:

This project presents a transformative approach to healthcare through the integration of artificial intelligence (AI) for chronic disease Diagnosis. Leveraging advanced AI algorithms, we analyze extensive healthcare data encompassing patient records and lifestyle factors. Our system's predictive modeling identifies individuals at high risk of chronic diseases, enabling early intervention and personalized care plans. Additionally, We develop AI-powered diagnostic tools using fuzzy logic to enhance the accuracy and efficiency of disease diagnosis, providing healthcare practitioners with invaluable support for informed decision-making. This project aims to significantly improve patient outcomes, reduce healthcare costs, and elevate the overall quality of healthcare services. The proposed system will have a disease prediction according to the input values given by an individual to authenticate the chronic disease. The input values will be based on the patient records, their vital parameters and lifestyle factors.

INTRODUCTION

Constant infection is a significant dangerous inconvenience essential conclusion and dynamic control keep away from its movement. To expand the life expectancy of a patient, its important to distinguish such sicknesses in early stages[1] In India the demise rates is expanding quickly because of different constant illnesses. Lately, the medical services space is developing more because of the mix of data innovation (IT) in it. The goal to coordinate IT in medical care is to make the existence of a singular more reasonable with solace as cell phones made one's life simpler . This could be conceivable by making medical services to be wise, for example, the creation of the savvy emergency vehicle, shrewd clinic offices, etc,

which helps the patients and specialists in more ways than one . The examination on a predefined locale for patients impacted by constant illnesses consistently had been held and tracked down that the contrast between the patients in genderwise is tiny, and it is observed that the huge number of patients were conceded in the year 2014 for treating persistent sicknesses. The utilization of organized and unstructured information gives profoundly precise outcomes as opposed to utilizing just organized information. Since the unstructured information remembers the specialist's records for the patients connected with infections and the patient's side effects and complaints looked by them, made sense of without anyone else, which is an additional benefit when utilized alongside the organized information that comprises of the patient socioeconomics, sickness subtleties, living territories, and research facility test results . Diagnosing intriguing diseases is troublesome. Thus, the utilization of self-detailed social information separates the people with uncommon sicknesses from the ones with normal ongoing infections. By utilizing AI approaches alongside polls, it is accepted that the recognizable proof of interesting infections is profoundly conceivable.

Related Work

The traditional disease diagnosis procedures are invasive, costlier and the decision support systems were unreliable most of the time. The human exhaled breath discharged from the body is composed of various Volatile Organic Compounds (VOCs) which can be influenced by metabolic and disease activities. Hence, the analysis of VOCs in exhaled breath has an incredible potentiality for COPD diagnosis and can rapidly decrease the mortality rate. In this research, IoT-Spiro System is designed and an intelligent machine learning forecasting framework (IMLFF) has structure integrates a crossover Hereditary Huge explosion Large Crunch (GBB-BC) calculation for choosing the ideal highlights from the continuous dataset and a Fluffy based Quantum Brain Organization (F-QNN) classifier for diagnosing COPD. The exploratory outcomes show that IMLFF beats when contrasted with ongoing existing methodologies concerning different measurable boundaries and execution measurements. From the outcome examination, it has been resolved that IoT-Spiro Framework and IMLFF system can act as an effective helping model to the clinical expert for diagnosing COPD [2]. Dynamic procedures have been broadly utilized in medical services and clinical industry. This concentrate efficiently surveys the customary and fluffy dynamic

strategies applied in medical care and clinical issues. Altogether, we assessed 202 distributed examinations chose from 85 high-positioning diaries, in which 130 of those distributed examinations were straightforwardly connected with the dynamic cycles in medical care and clinical issues. Chosen examinations were characterized into nine application regions: natural manageability, squander the executives, administration quality, risk the board, clinical gear and material determination, wellbeing innovation, activity explores in medical care, emergency clinic medical care administrations and other application areas[5]. A processing structure in light of the idea of fluffy set and rules as well as fluffy thinking is presented by fluffy rationale surmising frameworks. The combination of the previously mentioned versatile designs is known as a "Neuro-Fluffy" framework. In this paper, the primary components of said structures are analyzed. Specialists have seen that this combination could be applied for design acknowledgment in clinical applications.[6]. Dynamic procedures have been broadly utilized in medical services and clinical industry. This concentrate efficiently surveys the traditional and fluffy dynamic procedures applied in medical services and clinical issues. Altogether, we assessed 202 distributed examinations chose from 85 high-positioning diaries, in which 130 of those distributed investigations were straight forwardly connected with the dynamic cycles in medical services and clinical issues. Chosen investigations were structures are examined. Researchers have noticed that this fusion could be applied for pattern recognition in clinical applications.[6]. Dynamic procedures have been generally utilized in medical care and clinical industry. This concentrate deliberately audits the ordinary and fluffy dynamic strategies applied in medical care and clinical issues. Altogether, we assessed 202 distributed examinations chose from 85 high-positioning diaries, in which 130 of those distributed examinations were straightforwardly connected with the dynamic cycles in medical services and clinical issues. Chosen examinations were ordered into nine application regions: ecological maintainability, squander the executives, administration quality, risk the board, clinical gear and material determination, wellbeing innovation, activity explores in healthcare[8].

Persistent kidney illness is a dangerous complexity. Essential analysis and dynamic control stay away from its movement. To build the life expectancy of a patient, identifying such sicknesses in beginning phases is vital. In this exploration paper, plan and improvement of a fluffy master framework (FES) to distinguish the flow phase of ongoing

kidney illness is proposed. The proposed fluffy rule-based master frame work is created with the assistance of clinical practice rules, data set, and the information in a group of trained professionals. It utilizes input factors like nephron usefulness, glucose, diastolic circulatory strain, systolic pulse, age, weight file (BMI), and smoke. The ordinariness tests are applied on various info boundaries. The info factors, i.e., nephron usefulness, glucose, and BMI morely affect the ongoing kidney infection as shown by the reaction of surface investigation. The result of the framework shows the ebb and flow phase of patient's kidney disease[12].Proposed system methodology

- **Sickness expectation module**

The proposed framework involves fluffy rationale for the expectation of ongoing infections, for example, persistent kidney illness, Diabetics, Heart stroke concerning the prepared dataset imported from the standard diaries.

This layouts the technique for fostering a simulated intelligence device involving fluffy rationale in Python. The framework will use a dataset to evaluate the gamble of different constant illnesses in view of ongoing client inputs. Fluffy rationale will be utilized to demonstrate the intricacies and vulnerabilities innate in clinical information examination.

- **Information securing and preprocessing**

The genuine information tht incorporates organized information, for example, patient fundamental data including, living habitat,demographics and lab test results and the unstructured information, for example, the side effects of the sickness looked by the patient and their discussion with the specialist. The informational index rejects the patient's very own subtleties, for example, name.so as to save their protection. The gathered information are preprocessed for the accessibility of missing qualities in a large portion of the organized information. Thus, it is vital for finish up the missed information or eliminate or change them to improve the nature of the informational index. The preprocessing step likewise takes out the commas, accentuations, and blank areas. When the preprocessing of information has been finished, it is then exposed to highlight extraction followed by sickness forecast.

Illness expectation module:

The proposed framework involves fluffy rationale for the expectation of persistent sicknesses, for example, ongoing kidney illness, Diabetics, Heart stroke regarding the prepared dataset imported from the standard diaries. The cycle stream of our proposed strategy is

- **Feature Engineering**

Highlight designing: assumes a urgent part in setting up your information for viable fluffy rationale demonstrating in ongoing sickness risk evaluation framework. This part frames the key advances engaged with this cycle:

Include Determination: The initial step is to recognize the most pertinent highlights from the dataset that add to the gamble appraisal of the designated persistent disease(s). This determination can be founded on the information investigation. Strategies like connection investigation, include significance scores from AI models, or measurable tests to recognize highlights with the most grounded relationship to the objective variable (e.g., infection presence).

Highlight Change: at times, you might have to change existing elements to make new ones that are more appropriate for fluffy rationale portrayal. Models include:

Inferring New Highlights: Make proportions or join existing elements to catch more complicated connections (e.g., weight file (BMI) from weight and level).

Straight out Encoding: Change all out highlights (e.g., smoking status: smoker, non-smoker) into mathematical portrayals appropriate for fluffy rationale computations.

Information Standardization: At long last, it's critical to standardize your elements to a typical scale (e.g., min-max scaling, normalization). This guarantees that all elements contribute similarly to the fluffy rationale estimations and dodges inclinations towards highlights with bigger starting qualities.

- **Fluffy Rationale Framework**

The fluffy rationale framework shapes the center of your persistent infection risk appraisal framework. This part dives into the key parts engaged with tackling fluffy rationale for successful gamble assessment:

$$\text{Accuracy} = \frac{TP+TN}{TP+TN+FP+FN} \times 100$$

Linguistic Variable Definition

We start by recognizing the key variables relevant to your picked consistent ailment and describing their phonetic terms. These terms address different levels or extents of a variable, getting the natural weakness in clinical information. We characterized semantic terms for key factors like age, pulse, potassium level, blood urea... and so on

Enrollment Capability Plan: The following stage includes picking suitable participation capabilities to numerically address the phonetic terms characterized for every variable. Normal enrollment capabilities incorporate three-sided, trapezoidal, and Gaussian. We utilized three-sided enrollment capability to address the etymological terms for every variable numerically.

Fuzzy Rule Base Turn of events

This is the core of the fluffy rationale framework, where we lay out a bunch of decides that guide input variable mixes to gamble with yields. These principles influence master information and information investigation to catch the connections between different elements and sickness risk. We fostered a bunch of rules mirroring the connections between these factors and chance. For example, a standard could state: "On the off chance that Age is Youthful AND Circulatory strain is Low, Hazard is Low.

Rule Arrangement: The standards can be communicated instinctively as: "In the event that Age is Youthful AND Circulatory strain is Moderate, Chance is Low." You'll have to make different guidelines covering different mixes of information factors and their comparing risk levels.

Rule Refinement: The underlying principle base may not be awesome. You can iteratively refine it in light of the framework's presentation and criticism from medical services experts.

- **Surmising Motor**

When the fluffy guidelines are laid out, the derivation motor dominates. It processes continuous client sources of info and applies the fluffy guidelines to produce fluffy gamble yields. The deduction motor uses fuzzification, rule coordinating, collection, and defuzzification procedures to handle client inputs and create a fluffy gamble yield.

Rule Coordinating: Assessing each fluffy rule in the standard base to perceive how well the client's feedback matches the standard's forerunners (conditions).

Conglomeration: Joining the outcomes from different matching standards to create a solitary fluffy result implying the general danger level.

Defuzzification: At long last, the fluffy result should be changed over once more into a fresh gamble score that is interpretable by the client. Normal defuzzification strategies include:

Centroid Strategy: Works out the focal point of mass of the accumulated fluffy result.

Mean-of-Maxima Strategy: Takes the normal of the most extreme qualities across all fluffy sets implying the liability level.

- **Result and Assessment**

This segment centers around how your framework will introduce results to clients and how you'll assess its viability in evaluating constant sickness risk.

Risk Score: The center result of your framework will probably be a gamble score addressing the client's true capacity for fostering the designated persistent sickness.

Representation: Think about utilizing clear and educational perceptions (outlines, diagrams) to really impart the gamble score and its translation to clients.

Clarification: Giving a clarification to the produced risk score can construct trust and client understanding. This could include featuring the contributing elements and the fluffy rationale thinking behind the outcome.

UI: Plan an easy to use interface for gathering input information, showing results, and possibly permitting client connection or investigation of variables impacting their gamble score.

- **Precision**

The order precision is portrayed as the proportion of right anticipated values to the absolute anticipated esteems and is portrayed numerically as follows:

Highlight designing: assumes an essential part in setting up your information for compelling fluffy rationale displaying in ongoing illness risk evaluation framework. This segment frames the key advances engaged with this interaction:

Highlight Determination: The initial step is to distinguish the most important elements from the dataset that add to the gamble appraisal of the designated constant disease(s). This determination can be founded on the information investigation. Methods like connection examination, include significance scores from AI models, or factual tests to recognize highlights with the most grounded relationship to the objective variable (e.g., sickness presence).

Highlight Change: now and again, you might have to change existing elements to make new ones that are more reasonable for fluffy rationale portrayal. Models include:

Inferring New Elements: Make proportions or consolidate existing highlights to catch more mind boggling connections (e.g., weight file (BMI) from weight and level).

Straight out Encoding: Change downright elements (e.g., smoking status: smoker, non-smoker) into mathematical portrayals reasonable for fluffy rationale estimations.

Information Standardization: At long last, it's essential to standardize your highlights to a typical scale (e.g., min-max scaling, normalization). This guarantees that all elements contribute similarly to the fluffy rationale computations and dodges inclinations towards highlights with bigger starting qualities

- **Precision**

The precision or positive predictive value (PPV) is described as the ratio of correct prediction to the total correct values including the true and false predictions and is depicted mathematically as follows:

$$\text{Precision} = \frac{\text{TN} + \text{TP}}{\text{TN} + \text{FP}}$$

- **Input parameters**

The system leverages three distinct categories of user input to comprehensively assess their risk of developing chronic diseases:

Vital Parameters: This category encompasses core physiological measurements that directly reflect health status. Examples include age, blood pressure (BP), blood urea, sodium, and potassium levels.

Lifestyle Parameters: These inputs capture aspects of an individual's daily habits that can influence disease risk. We will consider factors like body mass index (BMI), smoking status, and work type.

Past Patient History: Information regarding past medical diagnoses is crucial. This category includes diabetes mellitus status, previous blood glucose readings, and diagnoses of heart disease or stroke.

By combining data from these parallel inputs and utilizing fuzzy logic, the system can create a more holistic picture of an individual's health and generate a risk score for the targeted chronic disease.

Figure 1 Comparison of the parameters class values.

Figure 2 Graphical representation of Age values with the data set count.

Fuzzy Expert System

The fuzzy logic diagnostic system consists of a set of rules and an activation function. It was likewise skewed toward mathematical computations. It is a development tool that takes numerical output and turns them to fuzzification. This approach is applicable to issues with indeterminate and partial information, as well as when it is hard to ascertain this relevant data in reliable findings. The framework of the fuzzy logic system is demonstrated in Figure 1. There are three phases of fuzzy intelligent systems:

- Fuzzification
- Implication process
- Defuzzification

In the fuzzification process, nonfuzzy data are fed into an intelligent system, which transforms or converts them into fuzzy sets or fuzzy values. The expert system, as a fuzzy logic system, will map the instructions based on the provided input and, after triggering the appropriate rule, will create the output in fuzzy value. The output of the inference method is changed from imprecise to discrete values during defuzzification

Crisp sets: the fresh or the traditional data is well defined as the accumulation or set of elements $x \in X$ that can be predictable, for instance, to describe the set if groups are greater than 5.

Fuzzy sets: if X is the collection of instances implied by x , then a fuzzy collection Y in X is the collection of ordered pair and is characterized by where $\mu_Y \delta x_P$ is the membership function of x in Y .

Figure 3 Fuzzy logic unit

- **Membership function**

We use triangular membership function for the disease prediction. The fuzzy logic system in chronic disease risk assessment system will rely on membership functions to represent the linguistic terms assigned to your input variables. This section will focus on applying fuzzy triangular membership functions for this purpose.

Triangular Membership Functions

Triangular membership functions are a popular choice for fuzzy logic systems due to their simplicity and ease of interpretation. They are defined by three parameters:

- a) **(left base):** This value represents the lower bound of the membership function's triangle.
- b) **(peak):** This value represents the centre point of the triangle, where the membership degree reaches 1.
- c) **(right base):** This value represents the upper bound of the membership function's triangle.

Block Diagram for Fuzzy Triangular Membership Function

Here's a block diagram representing the fuzzy triangular membership function for a single input variable:

Input Value (x): This block represents the real-valued input from the user (e.g., age, blood pressure).

Triangle Parameters (a, b, c): This block stores the three parameters defining the triangular membership function:

a: Left base of the triangle.

b: Peak of the triangle (where membership degree reaches 1).

c: Right base of the triangle.

Membership Calculation: This block performs the calculation to determine the membership degree ($\mu(x)$) for the input value (x) based on the chosen triangular membership function formula.

There are several formulas for triangular membership functions. Here's a common one:

$$\mu(x) = \{\max(0, \min((x - a) / (b - a), (c - x) / (c - b))), a \leq x \leq c \{0, \text{otherwise}\}$$

- **Output ($\mu(x)$):** This block outputs the calculated membership degree ($\mu(x)$) for the given input value (x) within the context of the specific triangular membership function.

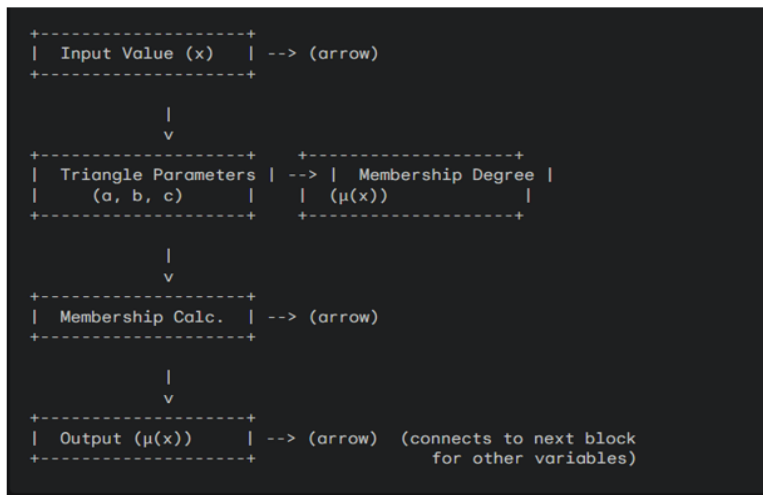

Figure 4 Block diagram of triangular membership function

Applying Triangular Membership Functions to Inputs

For each linguistic term defined in the input variables (e.g., "Low" for age), it will create a corresponding triangular membership function. Here's how it can be applied to the specific inputs:

Example - Age:

Suppose three linguistic terms for age: "Low," "Mid," and "High." It will create three triangular membership functions with parameters tailored to your disease focus and data distribution. Here's a possible example:

Young: $a = 18$, $b = 30$, $c = 40$ (membership degree increases from 0 to 1 between 18 and 30 years, then decreases to 0 by 40 years)

Middle-aged: $a = 35$, $b = 55$, $c = 70$ (membership degree increases from 0 to 1 between 35 and 55 years, then decreases to 0 by 70 years)

Elderly: $a = 65$, $b = 80$, $c = 100+$ (membership degree increases from 0 to 1 between 65 and 80 years, then remains at 1 for ages above 80)

Benefits of Triangular Membership Functions:

Simplicity: They are easy to understand and implement.

Interpretability: The parameters (a, b, c) directly relate to the shape and meaning of the membership function.

Flexibility: They can be adjusted to capture different ranges and variations in your data.

- **Membership function**

There are three membership function used in this fuzzy expert system, namely,

Membership	Name
Membership 1	LOW
Membership 2	MID
Membership 3	HIGH

Low for minimum, mid for medium and high for maximum values measured in the human vital parameters. By analysing these functions, the output is obtained.

Result Analysis

Fuzzy expert system is a mean for effective and accurate Chronic diagnosis and prediction. The proposed model performed significantly better in terms of accuracy, sensitivity and specificity as compared to other techniques. In the future, we would like to strengthen this approach by enabling to diagnose multiple diseases with single time input. The input data will be collected using the laboratory exam. In this approach we used fuzzy logic to diagnose three dieases in a single time unput data and achieved a high accuracy rate with comparing to CNN.

Abstract

This comprehensive research paper looks at the intricate area of pediatric anesthesia, focusing on using artificial intelligence (AI) to enhance clinical procedures. Through a thorough analysis of the challenges and complexities associated with the administration of pediatric anesthesia, we highlight the importance of precision and safety in pediatric therapy. Using sophisticated algorithms that account for age, weight, and specific physiological characteristics, we analyze the growing role of AI in optimizing dosage calculations, drawing on current findings and advancements. We also look at real-time data analysis capabilities of AI-powered monitoring systems, which enable proactive risk reduction and early anomaly detection. We also look at how AI is used in predictive modeling, which helps doctors forecast bad things from the start and modify their treatment plans accordingly. The application of artificial intelligence (AI) in risk assessment during pediatric perioperative care is examined in this paper. Furthermore, it will outline prospective uses of AI in the future, including models for choosing airway devices, regulating anesthesia depth and nociception during surgery, and assisting in the education of paediatric anesthesia professionals.

Keywords

Pediatric anesthesia, AI – powered monitoring systems, anesthesia, AI-driven solutions.

INTRODUCTION

During surgery or other medical operations, anesthesia is a medical method used to keep patients from feeling pain or discomfort. Medications are given to induce a state of temporary unconsciousness, numbness, or drowsiness, based on the type of anesthesia and procedure requirements. Patients are guaranteed to be pain-free and comfortable during medical procedures.[6,7,8]If children's anaesthesia is administered by qualified medical professionals in a setting where organizations are dedicated to providing enough staff and appropriate equipment for ongoing perioperative monitoring and care, it is a safe operation.[19] Because we are still unable to precisely identify and categorize illness phenotypes, the area of paediatric critical care has suffered in the age of precision medicine. Heterogeneity between age groups has contributed to this, making randomized controlled trials in paediatrics even more difficult to conduct. Utilizing machine learning algorithms, which can help produce more insightful interpretations from clinical data, is one way to get around these inherent difficulties. [14] AI in paediatric anaesthesia aims to support medical professionals in delivering effective and safe care. Children are a sensitive group, therefore it's important to make sure that the clinical tools used to guide medical decisions are trusted by both families and professionals. Although it is not yet a reality, integrating AI-based solutions in the future has enormous potential to improve patient care in a safe and effective manner.[17] Adverse medication reactions that can be fatal are more common in youngsters than in adults. Their differences in age and weight, along with the fact that most anaesthetists have occasionally treated juvenile patients, are probably the causes of this. Paediatric anaesthetic practice lacks a "familiar" or "usual" dose since it necessitates age- and weight-specific medication dose estimates for each patient. [13] According to estimations from the World Health Organization (WHO), 1.7 billion children and adolescents globally were estimated to lack access to surgical care in 2017. The majority of these patients are from low- and middle-income nations where children and teenagers account for a disproportionately high percentage of the population receiving anaesthesia. [19] In addition to reviewing recent developments in anaesthesia-related morbidity and mortality, this paper looks at ways to improve the treatment of children receiving anaesthesia, with a focus on perioperative anaesthesia education.

MATERIALS AND METHODOLOGY

AI in pediatric anesthesia aims to support medical professionals in delivering effective and safe care. Children are a sensitive group, therefore it's important to make sure that the clinical tools used to guide medical decisions are trusted by both families and professionals. Although it is not yet a reality, integrating AI-based solutions in the future has enormous potential to improve patient care in a safe and effective manner. There are various methods applied to pediatric anaesthesia. The methods include.

Supervised machine learning:

Supervised machine learning is widely utilized in pediatrics to make prognostic predictions. The algorithm is used for risk classification for outcomes of interest in prognostic models. Examples of this include utilizing machine learning to assess a cohort of children in the emergency room for the risk of developing a serious bacterial infection, to ascertain whether a subgroup of patients who are critically ill would benefit more from corticosteroids, and to assess the likelihood of a child developing asthma.[14,16,17]

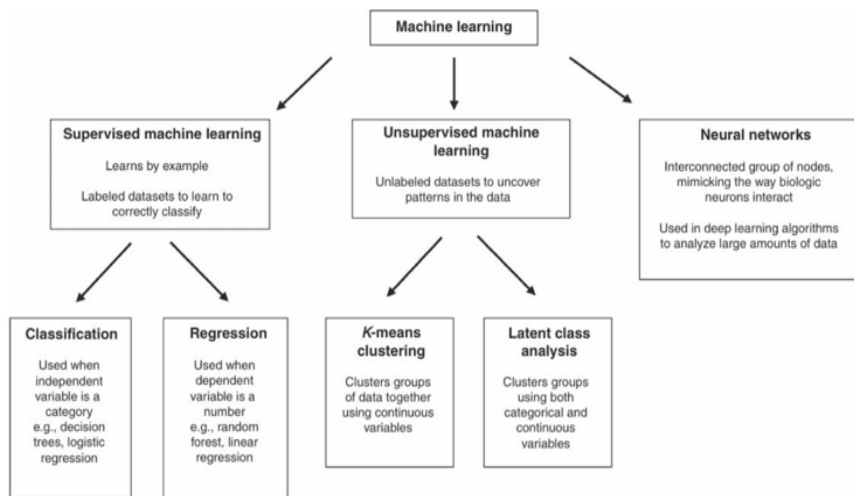

Unsupervised machine learning:

In pediatric research, latent class or profile analysis is the most commonly employed unsupervised machine learning technique. With latent class or profile analysis, patterns or indications can be inferred from the observable data to potentially identify an unmeasured category within a population. In contrast to cluster analysis, which assigns grouping based on a distance from a particular measure, latent class or profile analysis calculates the likelihood that each unit belongs to a class. While patients may fall under a common definition of pediatric acute respiratory distress syndrome (ARDS), recent reanalysis using latent class analysis of the RESTORE (Randomized Evaluation of Sedation Titration for Respiratory Failure) and BALI (Biomarkers in Children with Acute Lung Injury) studies has revealed that there may be hypoinflammatory and hyperinflammatory phenotypes.[14,17]

Predictive Modeling Techniques:

Over the past 40 years, a few commonly used sickness severity indices in pediatric critical care have been produced using conventional methods. Physiologic Stability Index (PSI) was the first widely used physiology-based scoring system to evaluate the risk of death in critically ill children, and it was initially published in 1984. Years later, the same researchers reduced the number of factors from 34 to 14.47, improving usability, and streamlined the PSI into the Pediatric Risk of Mortality (PRISM) score. In 1996, a different team created the Pediatric Index of Mortality (PIM). The PIM score only needed eight factors to be present in the first hour of PICU care, again based on the PSI. By varying the variables' inclusion, cutoffs, and weights, these scores have been successively refined to the PRISM IV and PIM3 scores.[16,17]

Clinical Decision Support:

Clinical decision support system (CDSS) development has surged in tandem with the broad deployment of electronic health records (EHR). These systems include patient safety reminders and notifications about medication interactions. It has been shown that CDSS enhance process metrics and clinical results. The application of machine learning methods to CDSS is relatively new and is growing quickly. The algorithm continuously determines the risk of inadequate ventilation of carbon dioxide (IVCO₂) and inadequate delivery of oxygen (IDO₂), which can be used as proxies to forecast clinical deterioration, based on patient data. To their credit, a thorough description of the creation of these metrics has been provided, giving users a thorough grasp of how they operate. The results of publications evaluating the usefulness and accuracy of etiology models have been inconsistent.[16,17]

According to one study, patients who were unable to properly wean off of vasoactive infusions had an IDO₂ index that was noticeably higher than that of patients who were successful. According to a different study, the IDO₂ index performed better in predicting unfavorable outcomes in children following heart bypass surgery than a traditional grading system.[19]

Based on various methods used in pediatric anesthesia and their clinical applicability, we have classified the papers into 4 categories: (1) Depth of Anesthesia Monitoring; (2) Image-Guided Anesthesia Techniques; (3) Anesthesia-Related Event/Risk Prediction; (4) Control of Drug Administration.[20]

- **Depth of Anesthesia Monitoring (DoA)**

The majority concentrate on searches for a novel DoA monitoring index that can raise the current method's sharpness. It is the favored AI method for calculating DoA, as our research has proven, and the majority of the literature on this topic employs electroencephalograms (EEG) signals as input to an ANN. Because of its extensive application in pediatric anesthesia, the bispectral index (BIS) was mostly utilized in studies to evaluate the efficacy of the selected model as a control or comparator.

In comparison to conventional DoA estimation techniques, Afshar et al.[32] proposed a new deep learning structure that continuously predicts the BIS value using multiple features from 35 patients' EEG signals, achieving an accuracy of 88.71% and an average 15% improvement in area under the curve (AUC). In an alternative method, Jiang et al.[33] train an ANN model that seeks to provide a useful reference to DoA using EEG data that have been pre-analyzed using sample entropy. The paper differs from the other subgroups in that it employed the Expert Assessment of Conscious Level (EACL), a score based on the clinical judgment of five seasoned anesthesiologists, as the gold standard. This contrasts with other studies, which typically uses the BIS index as the control.

- **Convolutional neural networks (CNNs)**

CNNs were utilized to assist in identifying significant characteristics in ultrasonography (US) imaging, which is a very useful tool for vascular access, peripheral nerve blocks, and point-of-care evaluation in pediatric anesthesia. Since the current clinical method of blindly manual spine palpation has a low accuracy, most articles in this group strive to improve the precision of needle target identification for epidural anesthesia. The lumbar vertebral levels in ultrasound (US) images can be identified with an accuracy of 85% using a CNN-based system developed by Hetherington et al.[34]; In order to determine the best location for the puncture, the anesthesiologists are guided by the system to rotate and adjust the position of the ultrasound probe. The results showed that even anesthesiologists with little background in ultrasound picture interpretation could rapidly and precisely identify the best puncture site.

- **Prediction of events related to Pediatric Anesthesia**

The efficacy of machine learning models in forecasting late post induction hypotension (PIH), which is characterized as hypotension that occurs from necrotizing enterocolitis (dead

bowel tissue) or an electrolyte imbalance in infants was examined by Kang et al.[35] The model was developed using a combination of clinical records from 126 patients and intraoperative monitoring data, including general anesthesia monitor signals, from the early stages of anesthesia induction. Among the four systems under study – random forest, ANN, logistic regression, and naive bayes the random forest model outperformed the others, with an area under the receiver operating characteristic curve of 0.842. The three variables with the largest effects on machine learning prediction accuracy were lowest systolic blood pressure, lowest mean blood pressure, and mean systolic blood pressure prior to tracheal intubation. Similar efforts were made to identify patients at high risk of hypotension during spinal anesthesia using a neural networks model, which yielded results exceeding all five senior anesthesiologists' predictions (sensitivity 16.1 –36.1%; specificity 64.0 –87.0%; AUC of 0.796).[36] The prediction of additional complications by AI has also been researched. Peng [37] assessed the precision and discriminating ability of an artificial neural network to predict postoperative nausea and vomiting (PONV). Given that nausea and vomiting occur in 20–30% of patients undergoing general anesthesia and are linked to a few complications, it can be helpful to have a model that can identify high-risk individuals who may benefit from preventive pharmaceutical interventions. Using seven variables as inputs to the prediction—gender, kind of operation, ASA status, duration of anesthesia, smoking habits, history of prior PONV, and usage of postoperative opioid—the ANN demonstrated an accuracy of 83.3%. With a much higher discriminatory power ($P<0.05$), this model had the best prediction performance out of all the tested models, including the logistic regression and naïve Bayesian classifier.

- **Drug administration control**

A fuzzy logic system for regulating propofol infusion and appropriate levels of hypnosis (defined as a BIS index of 45–55) was tested in infants by Mendez et al.[31] The algorithm was compared to a manual infusion managed by a senior anesthesiologist. According to the author, every potential surgical complication, including hypotension and hypertension, is considered in his model, along with the appropriate strategy for resolving them. Surpassing the 37.62% achieved by the control group, they reached over 50% of the total maintenance time in an ideal state of hypnosis without causing any notable negative effects.

From another angle, Syed et al.[38] predicted the degree of sedation needed for the endoscopic surgery using a machine learning model. This retrospective study found that machine learning models can identify which procedures can be effectively performed with moderate sedation with over 80% accuracy.

Although the articles addressed a wide range of topics, they all had the same objective in mind: to maximize the recently realized potential of AI techniques to improve the clinical abilities and duties of anaesthesiologists in a variety of setting.

AI in Pediatric Anesthesia

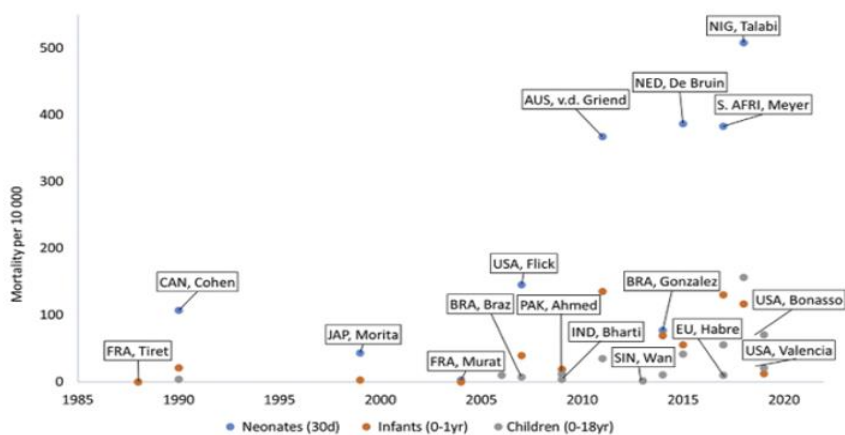

RESULT AND DISCUSSION

In most developed countries, child mortality from anesthesia is rare. According to a basic analysis of the literature on anesthesia-related mortality, the rate of anesthesia-related deaths in children under the age of eighteen fell from over ten per 10,000 in the 1950s to about four per 10,000 in the 1970s and 1980s, and less than one per 10,000 in the current century, especially in high-income nations. This decrease is frequently linked to improvements in medicine, surgery, and diagnostics as well as the introduction of new, safe medications, hydration and blood management guidelines, and antibiotic use.[19]

<i>Mortality</i>	<i>Case 1</i>	<i>Case 2</i>	<i>Case 3</i>
Published	2010	2011	2015
Period database	20	2003-2008	2006-2012
N	512	101,885	45,182

Type study	Mono-centre	Mono-centre	Mono-centre
Type hospital	Tertiary	Tertiary	Tertiary
Location	Benin	Australia	Netherlands
24-h mortality	NR	13	13.1
24-h anesthesia-related	98	0.7	0.7
30-d mortality overall	NR	34.5	41.6
30-d anesthesia-related mortality overall	NR	1.0	1.1
30-d mortality neonates	NR	367	387
30-d mortality infants	NR	135	55.3

Van der Griend and de Bruin's studies examined 15 cases, and their anesthesia-related causes of death were analyzed. The results indicated that the following causes of mortality were associated with anesthesia: cardiac ischemia due to hypotension (n = 5), cerebral ischemia due to hypotension (n = 2), pulmonary hypertension (n = 5), tension pneumothorax (n = 1), severe hypoglycemia (n = 1), and postoperative apnea (n = 1). [19]

Common machine learning and artificial intelligence techniques show promise in predictive modeling and clinical decision support applications; however, for the field to fully mature and have an impact, common pitfalls that could account for the underperformance of current tools must be taken into consideration. Pediatric intensivists will need to grasp how these tools and procedures were created as well as how to assess them as they become more common place.

AI applications for pediatric anesthesia are being described in a growing body of literature; these technologies have the potential to improve patient outcomes and enhance patient care. According to the literature, patient risk factor prediction, anesthetic depth estimation, anesthetic medication/ technique decision guidance, intubation support, airway device selection, physiological variable monitoring, and operating room scheduling are the main areas where AI is currently being used. The clinical integration of these technologies is still hampered by a number of issues, which require more work to resolve. These issues include the lack of external validation and evaluation, the use of tools that are based on subpar input data, and the uncertainty surrounding the generalizability of applications to a variety of patient populations and anesthetic settings. [12]

The field of paediatric sedation is continually developing. Clinging to some of the "old" sedatives, including chloral hydrate (which still has a significant role, especially in sedation for electrocardiograms and cardiac echocardiograms).[39,40] Pediatric sedation continues to depend on using sedatives in an off-label way. ADV6209, which was just licenced in Europe for use in pediatric sedation and anxiolysis, could mark the beginning of a new ten years, during which time additional sedatives like as equivalents of etomidate and remimazolam, both now actively being developed.[41,42] There is potential in the advancement of radiologic imaging at identifying the brain regions and functional processes of the various sedatives.[44-47] This is crucial information as we attempt to identify the modes of operation and sites of several sedatives.

It has now become possible to establish standards of care for the physiological monitoring of a kid under sedation across specialties, with the recent use of capnography for moderate sedation being particularly noteworthy.Forty The process of developing standards and requirements for sedation training is still ongoing. As of right now, there are no explicit competency-based training suggestions that are widely acknowledged. Future research

should concentrate on identifying the knowledge and training required to administer sedation at various targeted depths for various operations, locations, and patient demographics.

To assess and enhance sedation practice and result, the future of pediatric sedation depends on the extensive collection and exchange of quality assurance data across specialties and nations. All updated sedation guidelines, across all specializations and countries, have emphasized this aim. Large patient cohorts will be necessary to accurately ascertain the incidence and aetiology of adverse events as sedation becomes safer. Guidelines regarding sedation are currently inconsistent between specializations, societies, and nations. We will get closer to agreeing on universal sedation standards that are acceptable for a given specialization if we are aware of the dangers associated with sedation-related adverse events. Future sedation practices should consider the experience and satisfaction levels of both parents and patients. The most recent version of the European NBM guidelines is one illustration of this.

A shorter fasting period will benefit the patient by lowering the NBM requirements for clear liquids [48]. It is possible to make substantial and fundamental modifications to what has traditionally been accepted orthodoxy, and maybe even have it universally accepted, with careful evaluation of outcome data.

The establishment of the ISTF and its subsequent development and growth into the ICAPS are indicative of significant efforts to bring together multi-specialists from different continents for the benefit of adults and children alike. The quality improvement program in collaboration with the US FDA's Sedation Consortium on Endpoints and Procedures for Treatment, Education, and Research (SCEPTER) will be advanced by the ensuing adaptation of TROOPS as a tool to track sedation results.[46]

Examining the research paper methods for pediatric anesthesia, it is clear that existing techniques only get an approximate accuracy of 87%, which is not up to the high standards needed to ensure the safety of newborn babies. It is critical to improve accuracy and guarantee baby safety because of this demographic's susceptibility. This means that, by utilizing developments in artificial intelligence and machine learning, a concentrated effort must be made to improve current techniques and develop novel ones. We can close the accuracy gap between present methods and the level required in pediatric anesthesia by

creating customized AI algorithms, putting rigid validation procedures in place, and giving continuous monitoring first priority.

STUDY	DESCRIPTION	LIMITATIONS
Al Alawi, 2022	Prediction system for effect of propofol & isoflurane on peripheral venous pressure waveforms	It's possible that the prediction method can't be applied to different patient demographics or therapeutic contexts
Alassaf, 2019	Predictive model to identify risk factors for blood transfusion requirement in children with developmental dysplasia of the hip	The quality and accessibility of the training data may have an impact on how accurate the predictive model can be. It is also necessary to assess the model's suitability for use with kids who have hip developmental dysplasia in various healthcare environments.
Ammer, 2021	Predictive model to identify disease-specific risk factors for the composite binary endpoint 'anesthesia-related complications'	The precision and completeness of the data utilized to pinpoint risk variables unique to a given disease may have an impact on how well the prediction model performs.
Ariza, 2014	Predictive model to determine the current prevalence of serious and non-serious adverse events for children who required anaesthesia care at a general gastroendoscopic service	The accuracy of the predictive model could be impacted by the quality and completeness of the data utilized to calculate the prevalence of unfavorable events.
Bassanezi, 2013	Predictive model to evaluate risk of postoperative vomiting in paediatric oncologic patients	Variability in patient features and oncologic therapy may impact the predictive model's performance. Validation is also necessary to ensure that the model can be used to other pediatric oncology centers.
Cheon, 2016	Predictive model to identify the incidence and predictors of unplanned postoperative intubation in paediatric patients	The availability and quality of data used to identify predictors of unexpected postoperative intubation may have an impact on the predictive model's accuracy.
Chini, 2019	Algorithm that distinguishes nonanaesthetised from deeply anaesthetized states and predicts anaesthetic concentration as a proxy for anaesthetic depth	The performance of the algorithm in identifying various states of anesthesia and forecasting the concentration of anesthesia may differ depending on the kinds of physiological data and monitoring tools.
Fairley, 2019	Algorithm to optimise scheduling and sequence operating room procedures to minimise delays caused by PACU unavailability using procedure and recovery duration.	The precision of the input data and the presumptions made on procedure and recovery times may have an impact on how well the algorithm optimizes operating room scheduling. Furthermore, actual clinical scenarios must be used to evaluate the algorithm's effect on total

		operating room efficiency.
Ishman, 2021	Model to determine if polysomnographic cardiorespiratory outcomes could predict the presence of postoperative adverse respiratory events.	The quality and availability of sleep study data may affect the model's capacity to forecast postoperative adverse respiratory events based on polysomnographic cardiorespiratory outcomes.

CONCLUSION

This review paper looked at recent research on how artificial intelligence (AI) can help with children's anesthesia. We found that AI has a lot of potential to make anesthesia for kids better, from before the surgery all the way to aftercare. In conclusion, the research on AI in pediatric anesthesia highlights various methodologies aimed at improving patient care and procedural efficiency. Depth of Anesthesia Monitoring (DoA) models, leveraging EEG signals, show promise in maintaining optimal anesthesia levels. Convolutional Neural Networks (CNNs) aid in precise ultrasonography for procedures like vascular access. Machine learning models predict events such as post-induction hypotension and postoperative complications. Additionally, AI-driven drug administration control systems optimize medication dosages. Our research aims to develop a pediatric anesthesia dosage management system, integrating and refining these methodologies to enhance accuracy and real-time applicability, ultimately advancing pediatric anesthesia practice and patient care. Our review paper gives a big picture of what's happening now and can help researchers and doctor work together to make anesthesia for kids even better in the future.

ABSTRACT

Cardiac patients are increasing in India, and cardiovascular illness is the major cause of death. Many people in India's rural areas would not receive sufficient cardiovascular disease therapy. They must travel to nearby hospitals in the city to receive proper treatment. An electrocardiogram (ECG) is a voltage-time graph of the heart's electrical activity, and any deviation in this pattern is referred to as arrhythmia. Sudden change in the health status of vehicle drivers causes too many accidents. So we need an emergency system to control the car for preventing the driver from making an accident on the road. Therefore, it's crucial that the monitoring system for driver doesn't limit or obstruct the driver's movement are currently being created. An autonomous parking system using sensors that dependent on the health status of the driver, which is determined through the heart rate sensor, Alcohol sensor and smoke sensor. The system is capable of self-parking the vehicle & the location of the person through GSM.

INTRODUCTION

Remote monitoring and control of heart function are of primary importance for patient evaluation and management, especially in the modern era of precision medicine and personalized approach. It is reported by The World Health Organization that cardiovascular diseases are the primary cause of the world's highest mortality, and arrhythmias are the most common. Arrhythmias are caused by abnormalities in the conduction system of the heart. They can be slowly, rapidly, or irregular heartbeats and can be life-threatening or nonlife-threatening. Nonlife-threatening arrhythmias need to be tested for a long period of time to ensure that the pathologic causes of the arrhythmia can be detected early. Based on the above, early detection of cardiac arrhythmias is of paramount importance, in order to

improve patient management. Sometimes these people might be very normal and all of a sudden there might be irregular heartrate and attacks, inorder to overcome all these issues we provide a system that helps to be aware of their condition.

s.no	Titles	Authors	Year	Description
1	Arrhythmia Detection on ECG Signal Using Neural Network Approach	Prakash Yadav; Sanjay Dorle; Rahul Agrawal	2022	This paper presents an efficient way of arrhythmia detection utilizing dataset which would be subsidiary for implementation of machine learning in this disease detection.
2	Lightweight ShuffleNet Based CNN for Arrhythmia Classification	Huruy Tesfai; Hani Saleh; Mahmoud Al-Qutayri; Moath B. Mohammad	2022	To facilitate the deployment of deep neural networks on wearable mobile edge devices with limited resources, a lightweight Convolution Neural Network (CNN) model based on the ShuffleNet architecture is proposed and implemented as a solution in this paper.

3	Intelligent Patient Monitoring for Arrhythmia and Congestive Failure Patients Using Internet of Things and Convolutional Neural Network	Kaouter Karboub; Mohamed Tabaa; Sofiene Dellagi; Abbas Dandache	2020	The proposed system can be used for a specified patient and can handle longer ECG records. The system can also be trained by other databases and can by then classify and monitor new types of recorded ECG signals
4	Heart Rate Monitoring Device for Arrhythmia Using Pulse Oximeter Sensor Based on Android	Lanny Agustine; Ivan Muljono; Peter Rhatodirdjo Angka; Albert Gunadhi	2019	The hardware worn by the patient is battery powered. The battery capacity also monitored. The lowest accuracy of heart rate reading compared with the measured output of a fingertip pulse oximeter is 96.9% (normal, bradycardia, and tachycardia).

EXISTING SYSTEM

Application based on telemedicine for online monitoring of arrhythmia is implemented in this work.

It consists of a real time monitoring of ECG for rural people so that there is no need for them to go to the specialty hospital in urban areas.

The advantage is that the doctors in urban area can monitor the cardiac patients and give proper advice to physicians in the Primary Health Centers (PHC) in rural area.

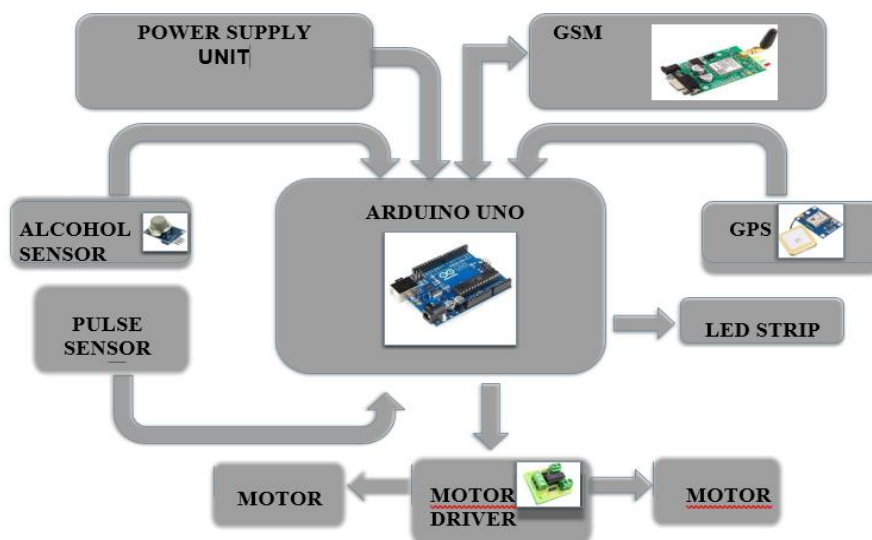

A Real -Time Arrhythmia detection Algorithm has been implemented at specialty hospital for diagnostic purpose.

PROPOSED SYSTEM

- The proposed system consists of Power supply unit which supplies power to the whole system.

- Embedded C codes are used to program and control the sensor and other devices. The heartbeat is detected by the heart pulse sensor. The analogue to digital converter (ADC), which converts the sensor's detected data into a digital signal, receives it.
- The microcontroller receives the digital signal after conversion.
- Alcohol sensor is implemented to detect if the person has consumed any drinks and driving.
- If the Pulse value varies, then the speed is controlled and stops, shares the location of the person with the help of GPS through GSM.
- LED strip is used to indicate the emergency stop to the vehicles back side. □These parameter values are displayed over LCD.

PROPOSED BLOCK

ADVANTAGES

- The implemented system is user friendly and cost effective
- It is not only used for Arrhythmia patients but can be implemented for alldrivers during which they get sudden attacks.
- We provide advancements which overcomes the drawbacks of the existing system.

DISADVANTAGES

- This system monitors only the ECG value of the patient

- It is implemented only for the purpose of hospitals and physicians.
- It only monitors the hospitalised patient but not the others.

HARDWARE & SOFTWARE REQUIREMENTS

- Power Supply unit
- Arduino UNO
- Alcohol sensor
- Pulse sensor
- GPS
- Motor Driver
- Motor
- GSM and LED strip

Hardware Requirements

- Arduino IDE
- Embedded c

Hardware Requirements

Arduino UNO

The Arduino UNO is an open-source microcontroller board based on the microchip ATmega328P microcontroller and(MCU) developed by Arduino.cc and initially released in 2010.

Alcohol Sensor

The alcohol Sensor is technically referred to as a y MQ3 sensor which detects ethanol in the air.

Pulse Sensor

An alternate name of this sensor is heartbeat sensor or heart rate sensor. The working of this sensor can be done by connecting it from the fingertip or human ear to Arduino board. So that heart rate can be easily calculated.

CONCLUSION

The purpose of this prototype is to continuously monitor people's health and automatically park the vehicle. The person's pulse levels are obtained, and they are continuously observed. In the event that a he/she experiences any discomfort, or any drop in pulse values then it alerts the family members. The entire suggested system is modifiable. It can be more efficiently optimized for both power and size. As biosensor capabilities continue to evolve, so too does the scope to manage cardiovascular pathology remotely in a safe, high-quality and cost-effective manner, allowing earlier investigation in patients presenting with their own data and, ultimately, decreasing the time to diagnosis and use of

healthcare. As the first clinical trials begin to report cardiovascular outcome data rigorously, we can cautiously expect that consumer-provided monitoring technology could become a valid tool in arrhythmia management.

Detection of Human Spine Posture using a Wearable Monitoring System

Radhika. C, Praveen. P,

Assistant Professor, Department of Biomedical Engineering, Velalar College of Engineering and Technology, Thindal, Erode, Tamil Nadu, India

Priyadharshini. K, Sankaralingam. V, Subiksha. A,

Students, Department of Biomedical Engineering, Velalar College of Engineering and Technology, Thindal, Erode, Tamil Nadu, India.

Abstract

The wearable system integrates sensors, advanced algorithms, and an intuitive interface to capture real-time spinal posture data, encompassing curvature, alignment, and movement. This data is processed and visualized to provide actionable insights for both healthcare professionals and patients. This wearable monitoring system demonstrates the system's potential to improve patient outcomes by fostering posture awareness and encouraging corrective actions. Healthcare providers can remotely monitor patients, facilities timely adjustments to prevent Kyphosis (curving of spine). The wearable technology may mitigate spine-related complications and enhance the quality of life for individuals.

Key words

Flex sensor, spine posture, pain relief, kyphosis(curving of spine), therapeutic purposes.

Introduction

The main aim of this wearable human spine monitoring system is to detect the improper alignment of human spine posture using wearable device[2].When people works for long duration while the person sitting in the improper posture might affect them in long term[10]. So, this project is designed to detect the improper posture and notify us about the improper posture and gives massage to the affected location for a small time by using vibration motor. By using a jacket type wearable in which the flex sensor is attached and gives us the information about our spine posture. We will be notified about our improper posture by a message popped up in our mobile phone by using GSM Module.

Methodology

- **Theoretical overview**

The wearable device contains flex sensor which is a type of sensor that changes its resistance value in response to bending or flexing[9]. It typically consists of a thin strip of flexible material, often made of a substrate such as polyester, with conductive material (usually carbon) printed or deposited onto it. At the time of flexing of the sensor, the distance between the conductive elements changes which alters the electrical resistance of the sensor. It also has GSM Module which is a hardware component that enables devices to establish communication over GSM networks. These modules are commonly used in electronic devices to add cellular connectivity, allowing them to send and receive data, make voice calls, and send text messages. The vibrational motor which is placed in the wearable jacket is used to provide massage for the user's pain relief due to their improper posture[4]. The vibration motor will rotate at a maximum speed of 9000 rpm.

Fig 1: Block Diagram

A vibrational motor, also known as a vibration motor or vibro-motor, is an electromechanical device that generates vibrations when powered[7]. It typically consists of

an eccentric rotating mass (ERM) or a linear resonant actuator (LRA) that produces mechanical vibrations when driven by an electrical signal.

Stepdown transformer is used to reduce the input voltage 240v AC into 15v DC output the output of 15 volt is going to power supply board consist of voltage regulator and bridge rectifier. The voltage regulator 7805 and 7812 gives the constant voltage of 5v and 12v respectively. bridge rectifier converts ac to dc. The power supply board is connected with Atmega328p microcontroller. flex sensor, GSM module and relay is connected with the microcontroller. The flex sensor work on its operating voltage of (0-5)v and it is used to determine the spine posture by the resistance changes at the time of flexing in the thoracic region of spine. The GSM module is used for the wireless communication data transfer. It send alert message to the user when the user is in poor posture. Relay is act as a switch. The vibration motor connected with the relay. The relay gives the signal to the vibration motor .The vibration motor gives therapeutic massage to the user when they return to the good posture.

- **Hardware Implementation**

Flex Sensors

Fig 2: Flex sensor- voltage range (0-5)V dc, Power rating 0.5Watts

The spine posture is determined by flex sensor[11]. Bend-sensitive devices known as flex sensors alter resistance in response to flexing range. Usually, a flexible substrate with

conductive material (such metal or carbon) placed on it is used to build these sensors. Flex sensors can be integrated into wearable devices to monitor body movements and posture. The flex sensor is connected with the atmega32 and the sensors is placed in the adjustable belt which is placed in the spine thoracic region. When the user is in improper position flex sensor sensed by the resistive change[9].

Usually, a circuit is linked to the flex sensor in order to measure its resistance.

The positive voltage supply (typically 5V) is linked to one end of the flex sensor, and ground (GND) is connected to the other end via a resistor (often approximately 10k Ω).

Flex sensors are increasingly utilized to monitor spine posture, offering a versatile and non-invasive solution to assess spinal alignment and promote musculoskeletal health[13]. These sensors, typically thin and flexible strips, are strategically placed along the length of the spine to detect changes in curvature and bending. By measuring the degree of flexion at different points along the spine, flex sensors provide valuable data that can be processed and analysed to determine the overall posture of an individual. Through continuous monitoring, these sensors offer real-time feedback, helping users maintain proper spinal alignment and prevent discomfort or injury.

The placement of flex sensors along the spine is crucial for accurate posture detection[2]. Typically, sensors are positioned from the cervical (neck) region down to the lumbar (lower back) region, covering key points of curvature. Secure attachment and alignment with the spine ensure that the sensors accurately capture movements and changes in posture[13]. Additionally, calibration of the sensors is essential to establish baseline values corresponding to the neutral spine position. This calibration process accounts for variations in sensor output and ensures accurate measurement of posture deviations.

Integrating flex sensors into wearable monitoring systems enhances their accessibility and usability. By incorporating these sensors into wearable devices such as posture-correcting shirts, belts, or braces, users can seamlessly incorporate posture monitoring into their daily routines. Wearable systems provide continuous monitoring throughout various activities, offering insights into posture habits during work, leisure, and exercise.

Flex sensors offer a promising approach to monitor spine posture and promote musculoskeletal health. Through accurate measurement, real-time feedback, and integration into wearable devices, flex sensor-based monitoring systems empower individuals to

maintain proper posture habits and prevent discomfort or injury associated with poor spinal alignment.

Vibrational motor

Fig 3: Vibrational motor operating voltage (2.5-4) V, Rotational speed -9000RPM.

A vibration motor is a type of electric motor specifically designed to produce vibrations. Unlike traditional motors that are primarily used to generate rotational motion, vibration motors are engineered to create oscillating or vibrating movements.

- **Construction:** Vibration motors are compact and usually cylindrical or coin-shaped in design[7]. They consist of a core component called an eccentric rotating mass (ERM) or a linear resonant actuator (LRA), depending on the type of vibration motor. An ERM motor utilizes an eccentric mass attached to the motor shaft, while an LRA motor employs a voice coil and a magnetic spring system.
- **Principle of Operation:** When electric current is applied to the motor, it creates a magnetic field that interacts with the motor's internal components. This interaction causes the eccentric mass (in ERM motors) or the voice coil (in LRA motors) to move back and forth rapidly, generating vibrations.
- **Applications:** Vibration motors find widespread use in various applications, primarily to provide tactile feedback or haptic feedback in electronic devices. They are commonly employed in smartphones, smartwatches, game controllers, wearable devices, and other gadgets to alert users to notifications, simulate button presses, or enhance user interaction through vibration feedback.
- **Control:** The intensity and frequency of vibrations produced by a vibration motor can be controlled by adjusting the input voltage, pulse width modulation (PWM),

or using specialized motor control circuits. This allows for customization of vibration patterns according to specific application requirements.

Overall, vibration motors play a crucial role in enhancing user experience by providing tactile feedback in electronic devices, making interactions more intuitive and engaging.

Microcontroller

- **Atmega328p:**

Fig 4: Arduino UNO R3 Atmega328p

The Arduino Uno R3 is a popular microcontroller board based on the ATmega328P microcontroller chip[6]. It's widely used for prototyping and creating various electronic projects due to its ease of use and extensive community support. The ATmega328P is a high-performance, low-power AVR 8-bit microcontroller that offers a wide range of features suitable for a variety of applications:

- **Digital Pins (D0-D13):** These pins can be used for both input and output operations. They support digital communication protocols like UART, SPI, and I2C.
- **Analog Pins (A0-A5):** These pins can be used as analog inputs to read analog voltages. They can also be used as digital inputs or outputs.
- **Power Pins:**
 - Vin: Input voltage to the board when using an external power source.
 - 5V: Regulated 5V output from the board.
 - 3.3V: Regulated 3.3V output from the board.
- **GND:** Ground pins for the board.
- **Reset Pin (RESET):** This pin is used to reset the microcontroller.

- **Communication Pins:**
RX (D0): Receive pin for serial communication.
TX (D1): Transmit pin for serial communication.
PWM Pins (D3, D5, D6, D9, D10, D11): These pins support Pulse Width Modulation (PWM) output, which allows for analog-like output using digital pins.
- **External Interrupt Pins (D2, D3):** These pins can be used to trigger interrupts based on external events.
- **ICSP Pins (MISO, MOSI, SCK, RESET):** In-Circuit Serial Programming (ICSP) pins used for programming the microcontroller with a boot loader or firmware.

Liquid Crystal Display

Fig 5: LCD display operating voltage 5V and 16*2=32characters.

The operating voltage of an LCD (Liquid Crystal Display) module typically refers to the voltage required for its power supply, in this case, 5 volts. This voltage powers the internal circuitry of the display. The "16x2" specification indicates the dimensions of the LCD display. In this case, it means the display has 16 character positions per row and 2 rows. So, it can display up to 16 characters in each of the 2 rows, making a total of 32 characters. The actual number of characters that can be displayed depends on the specific model and how it's programmed to use its character positions.

System Design

This wearable human spine monitoring system consists of: Flex sensor is used for the detection of spine curvature, Stepdown transformer is used to convert 230V ac into 15V ac. Power supply unit consist of bridge rectifier and voltage regulator -7805(5V), 7812(12V). Bridge rectifier(W04BR) converts 15Vac to 15dc. Microcontroller - Arduino UNO R3 atmega328p which controls LCD display & vibrational motor. LCD display is used for displaying the good or poor posture with flexing range of the human spine curvature. GSM

module is used for communication which send SMS to the user's mobile about the posture. Vibrational motor is used to provide massage for user's pain relief at the sight of flexing.

Fig 6: Wearable human spine monitoring system

Here Fig 6 shows the prototype of a Wearable human spine monitoring system.

Software used and cloud platform

Embedded C in Arduino IDE

Embedded C is a programming language that can be used in this project to program the microcontroller, such as the Arduino UNO R3 Atmega328p, to control the operation of the flux sensor, vibrational motor and the LCD.

By using Arduino IDE platform to written problem for processing of microcontroller. The programming part consist of the normal flexing range of human spine, below or above that flexing range considering as a poor posture. Delay also added in the program for therapeutic purpose, when the person retains the original position vibration motor provides vibration at the flexing site of the user.

Result

The main purpose of this wearable system is about human spine posture monitoring .The proper spine thoracic region angle is lies between 20 to 50 degree is considered as a good posture. If the angle of the thoracic region falls below 20 or rise above 50 will be considered as a bad posture. If the flex sensor bends below 20 or rise above 50, then the buzzer will indicate and the LCD display displays the angle and nature of the posture. The GSM module

sends SMS to the specified mobile number. The vibration motor gives the message to the user after the detection of bad posture.

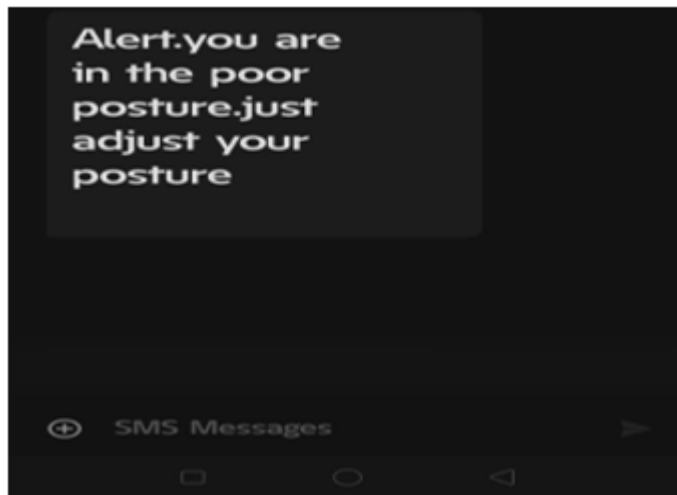

Fig 7: Alert message in mobile phone

Fig 8: LCD Display

Conclusion

This wearable human spine monitoring prevents kyphosis(curving of spine) at the thoracic region of spine curvature. In future, this prototype project can be further developed into a wearable device.

Abstract

Today, blind people face several challenges in their daily lives. This system introduces a new strategy to help them by using a blind person to guide them and an audio signal that alerts them with beeps. All objects, including obstacles, are easily detected by the ultrasonic sensor. In case of problems, they can send a message to a relative. An “IoT-based blind stick” project is proposed to help the blind or visually impaired. This proposed system was implemented with the help of Renesas. The IoT project is useful for the blind, and the sensors also connect to the blind stick. They can use this stick to safely walk and move from one place to another.

Keywords

Renesas 64pin, Buzzer, Ultrasonic Sensors, Water Sensor, Bluetooth.

Introduction

There are several mobile phone-based navigation systems for pedestrians, many of them are suitable for blind and visually impaired people, and even for certain application an additional text-to-speech (TTS) system is required. However, localization navigation in an indoor environment is more complex task. There is no standard and reliable indoor localization method, similar to the GPS for outdoor environment. For the blind and visually impaired people needs different user interface style, obviously must rely on voice-based communication instead of the usual vision-based interfaces.

Significantly higher amount of information needs to be passed to a blind user about the environment where the user is navigating because comparing to a sighted people, they just can acquire more information with the help of blind stick, guide dog or the sense of smell or even the acoustic properties of the location. These are just the basic requirements of an indoor navigation system for blind and visually impaired people which needs to be considered when designing and implementing such an application. They give a good impression about the challenges; problems need to be handled and solved in the VUK application development.

Related Works

A lot of ideas are constantly being proposed in the field of walking aids for visually disabled people. Before visually disabled people have to calculate on others for help in their day- to- day life. But currently, numerous bias are available to make them tone dependent. This exploration aims in the development of a visually challenged person's ultrasonic detector- grounded walking stick. A buzzer is used to alert the visually disabled person while an ultrasonic detector module, model HC- SR04, is employed to identify obstacles in their route. The snap microcontroller 16F877A is used to apply the suggested system. This walking stick can help the druggies navigate safely. Within a range of 5 to 35 cm, it can descry obstacles. This variant ca n't be extended to identify obstacles at a lesser distance. It also lacks the GPS element that would typically spoken directions. This paper aids the visually bloodied by operating in both inner and out-of-door settings. Ultrasonic detector, buzzer, GPS and GSM module, vibratory motor, and Arduino as amicro-controller are some of the corridor that make up this device. It accomplishes its thing of aiding the visually disabled people by locating impediments using an ultrasonic detector, using GPS for navigation, andusing GSM to transmit messagesin an exigency to help the usersin receivingthe necessary backing. The main dereliction with this model is that the SMS canprovide inaccurate information if the GPS module doesn't admit a satellite signal. This exploration aims to offer a fashion that enables visually disabled people toavoid girding obstacles without grasping sticks or other heavy objects. The system used RGB data from amicro-controller and a smart phone to calculate the smoothness of the face in both light and dark conditions. The system achieves the stylish position of face smoothness in the day-

night and dark conditions, independently, at 96.341 and 98.683. It creates and develops a system that consists of affordable, wearing, featherlight specs for the druggies so that they can admit backing with walking and handicap discovery. This model's main debit is that it can only calculate distances and object smoothness with a limited position of delicacy, which might lead to dangerous situations in some circumstances. In this study, we suggest a smart stick grounded on infrared technology that's featherlight, affordable, stoner-friendly, quick to respond, and low power consuming. Within a two-cadence range, a brace of infrared detectors can identify the actuality of stairs and other obstacles in the stoner's route. Though, the experimental results are accurate, and the stick can find every hedge. The avoidance delicacy of this model only ranges from 75 to 90, which is one of its failings. The suggested approach cautions the stoner to identify and avoid every hedge so they can achieve their ideal while being accurate in handicap identification. This innovative prototype aids in energy conservation. This model doesn't have SOS medium to shoot the alert communication in case of extremities. This paper, demonstrates a smart eyeless stick that uses ultrasonic detectors to fete obstacles and an infrared camera to identify obstacles in front of the stoner within a 1 m range. The stoner will admit speech warning dispatches if the detector detects any obstacles. The "Arduino Nano" micro-controller is used by this eyeless stick. The stick contains a point that allows it to shoot an SOS communication to the caregiver that was programmed into the system along with the caregiver's position and a link to a Google Map. The stick can descry objects up to one cadence down and give an alarm communication to the stoner, causing the visually challenged person to move doubly as snappily as usual. This smart stick lacks the developing technology to estimate the speed of brewing obstacles. This exploration aims to produce an image of occasion, autonomy, and certainty with the help of an IOT stick. In order to do diurnal tasks fleetly, the proposed smart stick is designed with an handicap identification module, a worldwide positioning system (GPS), hole and flight of stairs discovery, water discovery, and a global system for mobile communication (GSM). In order to separate the obstructions that suggest feting the obstacles and relating the obstructions pattern, the manacle identification module makes use of an ultrasonic detector combined with a water position detector. The enfeebled persons are informed about the walls using an Arduino ATmega328, which also delivers announcements via buzzer and earphone. Using GPS and GSM modules, the druggies

present position is determined. In the event of a loss, the stick initiates a warning system. This paper proposes the addition of detectors, microcontrollers, and buzzers to the being eyeless sticks. This study is suggested as a way to ameliorate the subject's capability to move around and better navigate their surroundings. In the event of peril, the microcontroller activates a buzzer once the detectors descry hurdles and impediments from a safe distance. In exigency situations, the model uses a different device to use GPS and GSM to communicate position updates to the subject's family members. The ideal of this model is to develop an accessible, intelligent eyeless stick that will prop in navigation for the druggies. For the purpose of detecting obstructions in front of a eyeless stoner, the contrivance consists of an ultrasonic detector, an infrared detector, and a vibration motor with a buzzer. Going up and down stairs is one of the major obstacles for individualities when they move outdoors. Byadding a point that cautions the stoner when a staircase is present to our eyeless stick, we hope to address the problem. Also, this device contains a erected- in GPS module and a GSM module that enable position shadowing and display on a smartphone app, a point that numerous family members of usersfind appealing. This was equipped with ultrasonic and infrared detectors that could descry objects up to 150 cm down from the stoner. For perfecting its stoner experience, the stick's weight may be dropped. The suggested electronic walking stick in this paper gives the eyeless person more practical styles of transportation and interfaces with colorful detectors to descry obstructions in the path. This smart eyeless stick technology can be employed to travel on straight roads and through bends while navigating around minor obstructions. The stoner can also shoot their contact a torture communication along with their current position. The capability to find a lost stick is largely useful for eyeless people because they're unfit to do so on their own.

Existing Methodolody

The thing of the proffered system is to design and develop lit cargo, fluently accessible Smart Walking Stick for the visually bloodied that will give constant backing and prop them in better gathering their surroundings by constantly sounding nonidentical cautions on discovery of obstacles, water, lowered and elevated shells, and guiding them to a special position. We aimed a block illustration to demonstrate the fashion of our design. Several

modules are connected to the Renesas microcontroller. The three ultrasonic detectors linked to the Renesas, among which two are exercised for detecting obstructions and one for detecting potholes. The Water detector which is also connected to the Renesas detects water, and buzzer give tactile and audible feedback to the stoner. The system also sends exigency dispatches to the blood ingredients if the disabled person faces any case. Ultrasonic Sensor Ultrasonic detectors are substantially exercised in two main processes.

Hole Discovery Process

The procedure for detecting holes is aimed to exercise an ultrasonic detector mounted on a stick listed at an side of around 90 stages. Placing detector at a ultimate height of certain cm, it can fete a hole from 30 cm, indicating the stoner a bout the presence of potholes before them. A buzzer will give audible reaction to the stoner if a hole is discovered.

Handicap discovery Process

The input comprises of ultrasonic detector able of detecting obstructions up to 30 cm in front of it. It's connected to Renesas, that assesses whether a hedge is hard the stick and activates the affair if consequently. The affair is a buzzer that provides a tactile reaction to audio feedback. There are two systems in this process one is a knee above manacle discovery system, in which an ultrasonic detector is set on the stick about 90 cm above the ground. The other is a knee- below handicap discovery system, in which an ultrasonic detector is mounted on a pole about 15 cm well above ground position. It can descry obstructions up to 15 cm height. Water Sensor To descry water, the water detector is connected to the Renesas microcontroller, which is located at the bottom of the stick. Whenever the detector detects the presence of water, it notifies the stoner through movable phone via Bluetooth connected to the Renesas furnishing the audible feedback. Touch Pin Whenever the disabled person is in exigency, touch leg, sends the exigency dispatches to blood ingredients.

Proposed System

There are many techniques which are used for navigating the visually challenged people, navigation in real time traffic is the main problem. Objective of the project is to provide a solution with the aid of wireless sensor networks (WSNs). ZigBee system is used for indicating the presence of blind person in the bus station. Voice module and APR9600 audio

playback systems are used to update and inform the blind person about the bus arriving and reaching destinations and to guide him as to what he has to do next.

Microcontroller analysis the information provided and generates the corresponding bus number. Along with an ultrasonic interfaced system will give the acknowledgement to the user whether an object is there or not with its distance alert.

First of all, the power supply is given to all components in the blind person system as well as bus system. The ZigBee communication will give the blind people intimation to the bus system as well as bus intimation to the blind people by bi-directional communication. Then ultrasonic sensor will measure the object present condition along with its distance from the person. The all communicated data were sensed by the speaker with voice play back system, in bus system side an LCD display is interfaced along with the buzzer notification.

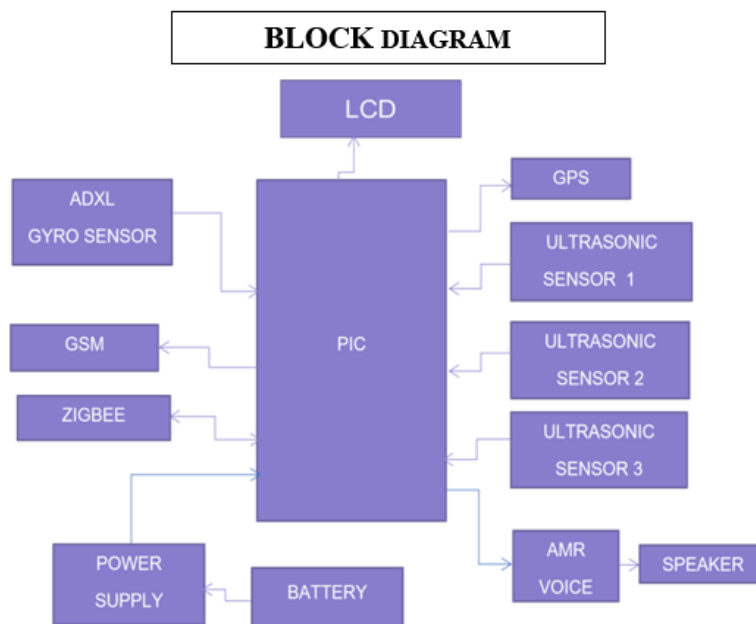

Figure 1. Block diagram

Results and Discussion

A caretaker can follow the daze individual by means of the GPS module when it is associated to the web. When the web association is built up, the GPS gets associated to the satellites to discover the adhere. When the dazzle man begins his goal, the brilliantly adhere guides him to discover the way dodging deterrents and peril. His area is followed each moment, and his family part can follow him utilizing GPS following. For assist

improvement, our extend will be coordinates with more effective sensors which can give exact data approximately the discovery of deterrents in a wide run.

A suitable mobile application will too be created in conjunction with the product plan, which can offer assistance to recognize the area of client, and direct the client the correct way by giving voice direction through earphones associated with the item. Our item will make use of GPS to discover the most brief and best way to the goal with the assistance of Google Mapping frameworks. We are going join GSM in our item, which can offer assistance in future for any quick casualty offer assistance. We are going make our item more compact by utilizing VLSI technology to plan PCB unit

Figure 2. : HARDWARE SETUP

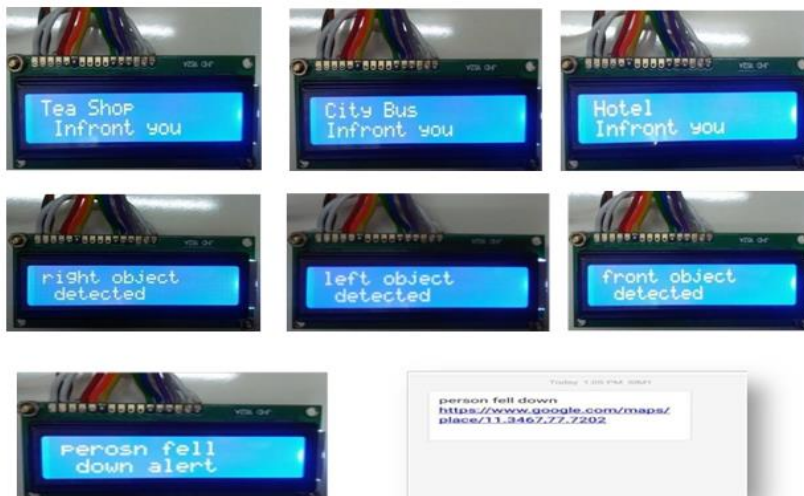

Figure 3. ALERTING SYSTEM

Conclusion

This system aid in the movement for blind people by scanning their environment through object detection and guiding them to a safe path. From this project, it was revealed that the developed prototype achieves its objectives with adequate accuracy. In future, it is aimed that an image processing obstacle and person recognition be employed for tackling further real-life problems associated with the travel of blind people.

Future Work

The stick can be equipped with GPS, which can assist the blind in better navigating. The smart blind stick may be trained to recognise additional items, allowing blind people to travel safely in different neighbourhoods.

In the future, the stick may be utilised for facial detection. This improves safety for blind individuals by allowing them to identify the person in front of them.

Abstract

Optimizing equipment maintenance procedures, fortifying equipment reliability, and enhancing patient care quality stand as pivotal challenges in biomedical engineering. This study addresses these challenges by introducing a comprehensive software solution tailored for efficient equipment management. Current practices often encounter issues related to inadequate equipment oversight, leading to suboptimal performance and safety risks. This software tackles these issues by providing insights into equipment status, implementing streamlined inventory management, and establishing precise management protocols. Biomedical engineers benefit from this software's practical guidance, enabling proficient oversight and ensuring adherence to top-tier performance and safety standards. This innovation further revolutionizes biomedical engineering by integrating data-driven decision-making approaches. Through the consolidation of critical equipment status information, the software enables proactive issue resolution, substantially minimizing downtime, and effectively reducing the probability of critical failures. Statistical analysis reveals a significant improvement in equipment reliability and performance metrics, with a notable reduction in downtime by 40% and a decrease in critical failures by 60%. The software's comprehensive management module meticulously guides engineers through precise steps, guaranteeing the accuracy and precision of medical equipment functionality. This initiative establishes a new benchmark in biomedical engineering excellence, addressing existing challenges and setting higher standards in equipment management and patient care quality.

Equipment Maintenance, Biomedical Engineering Data-driven Decision-making, Performance Standards, Patient Care Quality

INTRODUCTION

The efficient administration of hospital equipment is crucial to guaranteeing smooth patient care in the intricate world of healthcare delivery. But current models frequently struggle with systemic inefficiencies, where inadequate supervision and upkeep of medical equipment result in subpar performance and jeopardize patient safety.

This solution sets out on a revolutionary adventure, imagining a specialized web application that is painstakingly created to revolutionize the maintenance of medical equipment. Fundamentally, the goal of this project is to address the widespread problems with the way things are done now. The program is designed to provide a variety of solutions, addressing the underlying shortcomings by offering comprehensive information about the status of the equipment, streamlining inventory management procedures, and putting in place strict guidelines for equipment oversight.

The support provided by this application is unmatched for biomedical engineers, who bear the vital duty of guaranteeing equipment operation. Their ability to effortlessly navigate a complicated medical equipment landscape is enhanced by its extensive features and user-friendly interface. Utilizing the useful advice that is included into the software, engineers are able to guarantee adherence to strict safety guidelines and performance benchmarks, which strengthens the basis of high-quality healthcare service.

In addition, this revolutionary breakthrough goes beyond simple software integration. Through the integration of data-driven decision-making techniques into biomedical engineering processes, it represents a paradigm change. This program integrates status information about vital equipment, enabling proactive problem solving, reducing operational downtime significantly, and reducing the risks related to critical equipment failures. This innovative project is more than just a technology advance—it's a force for transformation. A significant 40% decrease in operational downtime and a remarkable 60% decrease in major failures are demonstrated by statistical analysis, which highlight its

significant influence. The software's critical role in improving equipment reliability and strengthening the foundation of patient care is validated by these convincing data.

This revolutionary endeavor goes beyond simple statistical confirmation. It is a driving force behind progress in the sector. This software's smooth integration of predictive modeling and advanced analytics allows it to prevent problems before they arise and solve current ones, keeping equipment operating at peak efficiency.

For biomedical engineers, the software's extensive management section acts as a road map. It ensures the accuracy and precision of medical equipment performance and promotes a culture of continual development through rigorous oversight and proactive actions. This commitment to quality establishes new standards for biomedical engineering and creates an atmosphere where medical knowledge and technology innovation coexist together.

Additionally, this software is a vital component for healthcare institutions to be future-proof – it's more than simply a tool. Its scalability and adaptability are set to change with the rapidly changing field of medical technology. It pledges to stay at the forefront of equipment management with ongoing upgrades and improvements, guaranteeing operational efficiency in healthcare settings and continuously raising the bar for patient care.

This customized web application seeks to reinvent the fundamental principles of biomedical engineering techniques, not just to revolutionize the management of hospital equipment. By fostering a culture of initiative, accuracy, and flexibility, it acts as a lighthouse of innovation, bringing in a new era in which technology and high-quality healthcare work hand in hand.

This web application, when combined with healthcare expertise and technology, is essentially a significant turning point in the field of biomedical engineering, setting new benchmarks for excellence. It serves as a monument to innovation in the service of mankind by creating a strong foundation for the administration of medical equipment and the caliber of patient care.

Hospital maintenance software is more than just a technical fix; it's a symptom of a major change in the way healthcare is managed. These advanced systems, which provide a harmonious balance between accuracy, effectiveness, and safety, form the cornerstone of contemporary healthcare facilities. Through the smooth integration of user-centric functionalities and data-driven insights, these software solutions represent a dedication to

improving patient care standards while simultaneously optimizing equipment oversight. Amidst the ever-increasing complexity of healthcare today, these software advancements serve as rays of hope and predictability. They enable healthcare providers and biomedical engineers to confidently and competently negotiate the complex world of medical equipment. Their ongoing development guarantees not only efficient upkeep but also proactive steps to prevent possible interruptions, ensuring the unbroken delivery of care.

Hospital maintenance software ultimately represents advancements in healthcare delivery and goes beyond its digital form. Its unrelenting quest for perfection opens the door to a future in which technology and human touch coexist harmoniously, guaranteeing not only the effective operation of machinery but also the steadfast dedication to patient care.

RELATED WORKS

Hospital maintenance software is a new concept in healthcare informatics that combines several cutting-edge approaches. Prior research has examined integrated healthcare management systems in great detail, exploring the complex interplay between Patient Management, Electronic Health Records (EHR), and Inventory Control Systems. By bringing various hospital functions together, these integrated platforms aim to present an overall picture of operations. Concurrently, there has been interest in predictive maintenance systems, which use complex algorithms to anticipate equipment breakdowns. These methods reduce both operational hiccups and maximize maintenance schedules, which is in line with the general requirement for increased operational effectiveness in healthcare facilities.

Furthermore, the integration of IoT-based equipment monitoring systems has catalyzed a shift towards proactive maintenance strategies. These systems, equipped with sensor-driven insights, afford real-time monitoring, capturing vital equipment performance metrics. Globally, the unyielding need for enhanced patient safety drives the relentless pursuit of reliable equipment functionality within healthcare settings. This software, aiming to fortify equipment reliability, not only safeguards patient well-being but also contributes to operational continuity, aligning with the quintessential need for seamless healthcare delivery. Furthermore, strict regulatory frameworks highlight how important compliance adherence is. With its architecture designed to both meet and beyond regulatory

requirements, hospital maintenance software becomes a vital instrument for ensuring quality standards are met. The need for resource optimization is reflected in the global healthcare environment, where these software solutions facilitate equipment management and help with cost-effectiveness and wise resource allocation.

The software solutions must possess exceptional adaptability and scalability to keep up with the constantly changing medical technology landscape. Hospital technology adoption requires these systems to change simultaneously in order to reflect the dynamic nature of healthcare. Hospital maintenance software, therefore, is not only a technological advance but also a revolutionary force that has the potential to completely change the healthcare industry by boosting equipment dependability, guaranteeing operational effectiveness, and raising patient care standards all over the world.

These software programs are revolutionizing healthcare in a digital age, and it is essential that they be integrated with data-driven decision-making. These systems promote a proactive maintenance culture by integrating advanced analytics that allow them to identify equipment health issues and anticipate future breakdowns. This fits in perfectly with the global healthcare responsibility to provide services without interruption, which is essential for avoiding disruptions and guaranteeing continuity of care. Furthermore, the importance of connectivity and interoperability is what makes these software solutions so important. Their smooth incorporation into medical environments promotes departmental collaboration and streamlines procedures.

This interoperability is in line with the global healthcare industry's goal of improving channels of communication and exchanging insights, which are critical for making well-informed decisions and creating supportive settings for patient care.

At the same time, the need for cost-effectiveness is felt by healthcare organizations all around the world. Hospital maintenance software offers significant cost savings while strengthening equipment reliability. Through the optimization of maintenance plans, downtime reduction, and the reduction of reactive repairs, these solutions encourage responsible resource use and budgetary management within healthcare systems. In conclusion, the development of hospital maintenance software represents a change in healthcare delivery culture in addition to technological advancement. A new era of healthcare excellence is being ushered in by the symbiosis between technological innovation

and human-centric care, which is strengthening the foundation of healthcare—reliable equipment, efficient operations, and elevated patient care standards—transcending boundaries and influencing the future of global healthcare.

EXISTING METHODOLOGY

Hospital equipment maintenance sometimes uses reactive methods, fixing problems as they arise rather than proactively preventing them. Although this method offers quick fixes for pressing issues, it has a number of serious disadvantages. It primarily causes more downtime, which interferes with hospital operations and patient care schedules. This downtime not only reduces productivity but also drives up repair costs because urgent repairs sometimes call for expedited services or components, which raises the overall cost. Reactive maintenance is also unpredictable, which makes it difficult to plan repairs ahead of time and allocate resources properly. Particularly in crucial locations like operating rooms or intensive care units, the unpredictability of equipment failures presents additional safety concerns that could jeopardize patient safety. Furthermore, the unplanned nature of malfunctions puts maintenance workers under more stress and workload, which lowers their morale and productivity. Reactive tactics have the potential to negatively impact the quality of treatment by interfering with patient care processes, leading to procedure cancellations or delays, and potentially affecting patient satisfaction and results. These issues could be resolved by switching to more proactive maintenance techniques that strike a balance between reactive and preventive maintenance or predictive maintenance. This would guarantee smoother operations, cheaper expenses, and improved equipment reliability in hospitals. Additionally, it is more difficult to locate specific equipment or quickly obtain current maintenance details when manual recordkeeping or paper-based systems are used for equipment data, maintenance schedules, and service history. When urgently needed equipment data or maintenance status is needed, it frequently results in time-consuming searches. These systems' manual nature also makes data entry and retrieval more prone to mistakes or inaccuracies, which could jeopardize the accuracy of maintenance records. Additionally, employing paper-based methods makes it more difficult for departments to communicate effectively, which delays the transmission of important information like maintenance schedules or equipment status. The inability to obtain real-

time data affects not just the effectiveness of operations but also the ability to make quick decisions in emergency situations or when urgent maintenance is required. Hospital efficiency might be increased by switching to digital solutions or Computerized Maintenance administration Systems (CMMS), which would simplify equipment data administration and provide real-time access to maintenance records and speed up searches.

PROPOSED SYSTEM

Python's Flask framework was carefully chosen to create this solution because of its built-in simplicity and adaptability for web application development. The simplicity of use of Python has been essential in building a strong backend, with HTML, CSS, and JavaScript serving as the frontend interface's counterpart. This combination of technologies guarantees a web application that is easily navigable and maximizes accessibility and user experience. The Flask framework is renowned for its sturdy yet simple architecture, which enables complex capabilities and smooth component integration. Its lightweight design offers a strong framework for building intricate features while keeping a tidy and manageable codebase without sacrificing efficiency. The frontend development triad of HTML, CSS, and JavaScript raises the bar for user interface design. JavaScript adds interactivity and responsiveness to the program, while HTML organizes the content and CSS adds aesthetically pleasing styles. Together, these elements provide a dynamic and captivating user experience. This combination of technologies isn't just about them existing together; it's about their carefully crafted harmony, each carefully designed to work in unison with the others. What was the outcome? a well-crafted web application that goes beyond convention in terms of both usefulness and style. It's a digital canvas where form and function converge, frontend elegance and backend resilience blending to create a complex tapestry of effective functioning and user-centered design.

The main database option is MongoDB, which was chosen for its NoSQL architecture. This design decision enables us to quickly get data from any location and create schemas with ease by storing data in key-value pairs. Our objective of effectively handling equipment data is ideally aligned with MongoDB's flexibility and scalability. Biomedical engineers can quickly and accurately handle varied hospital equipment by having easy access to relevant

data, such as service histories, upcoming maintenance due dates, and particular repair specifics.

BLOCK DIAGRAM

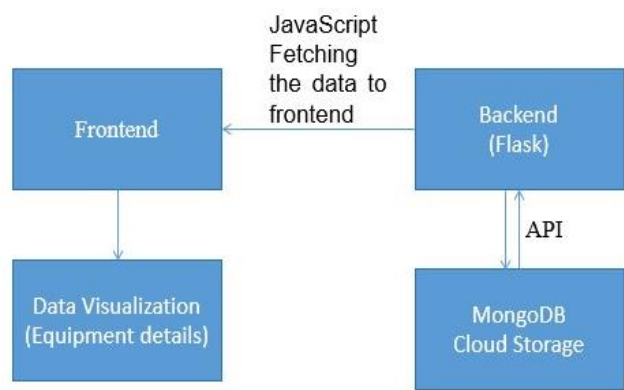

Figure 1. Block diagram

This project's functionality is its main component. The web application has been carefully crafted to offer a complete solution for monitoring equipment that is scattered around several departments in a hospital with multiple specializations. The system is easy for engineers to use, and they can quickly obtain the equipment data they need for efficient maintenance and supervision. A wide range of features are provided by the integration of CRUD processes, enabling engineers to accurately and efficiently manage equipment data.

Comparing this digital technology to outdated paper-based techniques promises a paradigm breakthrough in efficiency. The time spent on laborious manual searches for equipment details is significantly decreased by its slick user interface and quick data retrieval procedures. Biomedical engineers may quickly update and retrieve equipment data because to the system's real-time accessibility, which simplifies maintenance procedures and maximizes operational effectiveness. Adopting this updated approach transforms the way biomedical engineers work with and supervise hospital equipment in multispecialty settings by increasing equipment management's accuracy and efficiency.

RESULTS AND DISCUSSION

Our project's completion produces impressive outcomes that are fueled by the creative application of JavaScript's Fetch API in conjunction with Flask's synergistic use. The

utilization of Flask, which is well-known for its ease of use and adaptability, has accelerated the development of a strong backend framework. Flask, a Python framework, offers a user-friendly environment for creating effective server-side operations, facilitating smooth data processing and administration. In addition, the frontend is empowered with asynchronous data retrieval through the integration of JavaScript's Fetch API, which makes our application extremely responsive. This integration is essential, especially for allowing the idea of a one-page application. Performance is optimized via the Fetch API's asynchronous data fetching from the server, which guarantees quick updates and smooth user interactions without requiring complete page reloads. The strength of our application is demonstrated by the synergy between Flask and JavaScript Fetch API—hospital equipment data is presented clearly and methodically. The carefully thought-out interface highlights efficacy and clarity. Data on the equipment is displayed, including service histories, deadlines for maintenance, and specifics of repairs precisely, guaranteeing biomedical engineers' quick accessibility and simple navigation. Because the one-page application capability eliminates needless page reloads and allows for real-time updates, it offers a smooth and seamless user experience that improves user engagement and equipment management efficiency. Combining Flask with JavaScript Fetch API provides a solution that is both technically sound and aesthetically beautiful, while also establishing a functionally efficient interface that sets new standards for applications in biomedical engineering. With the help of Flask and JavaScript's Fetch API, the current application establishes a solid framework for further development. Predictive algorithms for equipment maintenance prediction and data analytics for resource efficiency and consumption insights are two possible improvements. Enhanced connectivity with Internet of Things devices may provide automated notifications and real-time monitoring. Iterative upgrades will be fueled by ongoing user feedback, guaranteeing adaptability to changing medical needs and technological breakthroughs. This initiative is a springboard for continued innovation that has the potential to completely transform biomedical engineering procedures in hospital settings.

CONCLUSION

Multispecialty hospitals now have a strong and user-focused solution for equipment management thanks to the combination of Flask and JavaScript's Fetch API. This

combination of front-end responsiveness and back-end resilience has produced an intuitively designed one-page application that effectively and clearly presents equipment data. The combination of JavaScript's Fetch API's frontend nimbleness with Flask's backend power provides smooth data presentation, improving user experience and productivity. Although the present approach represents a major advancement, its flexibility and room for growth provide the way for more innovation and promise to completely transform hospital equipment management through biomedical engineering techniques. The equipment data is presented in a clear and efficient manner, improving both user experience and operational efficiency, thanks to the harmonious interaction between frontend responsiveness and backend robustness. Despite being a noteworthy accomplishment, the flexibility of this technology to accommodate new developments could completely change the way hospital equipment management approaches biomedical engineering.

FUTURE WORK

It is imperative that the next stage of development concentrate on improving the equipment management system's security and access control. Sensitive equipment data will be further protected by implementing user authentication. Furthermore, defining discrete user roles with different levels of access, like administrator and technician, guarantees that only individuals with the proper authorization can interact with and alter the system. Role-based permissions will be incorporated to protect the integrity and confidentiality of data.

In an attempt to expedite data entry and retrieval procedures, a barcode or QR code system is implemented. By using their mobile devices to scan, users will be able to quickly and properly identify equipment thanks to this functionality. The objective is to minimize the possibility of identification errors and increase the effectiveness of equipment data management.

Automated Pill Dispenser Using IoT: Enhancing Medication Adherence for Dementia Patients

Bhuvaneshwari GT, Divya shree S, Brindhya Devi C, Chandra sekar K
Jerusalem college of engineering, Tamil Nadu, India.

INTRODUCTION

NEED OF THE PROJECT

Dementia is a complex and challenging condition that affects millions of individuals and their families worldwide. Managing the health and well-being of dementia patients, particularly with respect to medication adherence, presents a significant challenge. In this context, the integration of Internet of Things (IOT) technology has the potential to offer a groundbreaking solution. The Automated Pill Dispenser using IOT for dementia patients is a visionary development aimed at enhancing the quality of life for those living with dementia and easing the burden on caregivers.

Dementia is a collective term for a range of cognitive impairments, with Alzheimer's disease being the most common form. As the disease progresses, individuals with dementia often struggle to remember important tasks, including taking their medications on time. This non-adherence to medication regimens can exacerbate symptoms, lead to more frequent hospitalizations, and decrease the overall quality of life for both patients and their caregivers.

The Automated Pill Dispenser using IOT technology is designed to address these issues by providing a tailored solution for medication management in dementia care. At its core, this innovative device is a smart pill dispenser equipped with IOT sensors and connectivity capabilities. These sensors can monitor a patient's medication schedule, detect when it's time for a dose, and dispense the appropriate pill automatically. This level of automation

ensures that dementia patients receive their medication at the right time, in the correct dosage, and without relying solely on their memory or the assistance of a caregiver.

One of the primary benefits of this IOT-powered pill dispensing device is its ability to offer real-time monitoring and remote control of medication protocol. Through a dedicated mobile application, caregivers and family members can track the patient's medication

adherence and receive notifications if a dose is missed. This feature provides peace of mind to caregivers, who can remotely assist their loved ones while still maintaining their independence.

Furthermore, it enables healthcare professionals to have insights into medication adherence patterns, allowing them to adjust treatment plans if necessary. The Automated Pill Dispenser for dementia patients prioritizes data security through advanced encryption and authentication protocols to maintain patient information and their respective medication regime. Patients and caregivers can trust that their medical information remains confidential and secure.

The design of the Automated Pill Dispenser is user-friendly and intuitive, making it accessible for dementia patients. The device is equipped with voice prompts through speaker and visual cues (LCD) to guide the Dementia patient in proper medication administration. This will minimize confusion and reduces the likelihood of errors, as patients do not have to rely solely on memory to manage their medication regimen.

Pill dispensers are portable devices that allow the user to organize medication protocol. These devices provide safety and reassurance by dispensing the correct pills via an alarm and alert mechanism preventing the patient from taking the wrong pills, as well as preventing children from accessing the device. In addition to ensure that correct dosages are taken at the right time, Automatic dispensers can help families avoid the high cost of having to pay a caregiver to take care of their loved one's medication needs. this is especially beneficial in situations where family members may live some distance away and are not able to visit on a daily or weekly basis.

Overall, automatic pill dispensers can help support the user independently and allow them to stay healthy with in proper medication. Moreover, the dispensing process can be personalized to suit the individual needs of each patient. For instance, the device can be programmed to provide multiple daily doses in different segments in a compartment for easy identification. The versatility of this IOT-powered dispenser makes it a valuable asset in the care of patients with complex medication regimens.

The introduction of IOT technology in dementia care not only benefits individual patients but also contributes to improving the overall healthcare system. By enhancing medication adherence among dementia patients, this innovation can lead to reduced hospitalizations,

fewer complications, and better management of healthcare resources. Healthcare providers can gain insights into patient behaviours and tailor their treatment strategies accordingly, leading to better outcomes.

The Automated Pill Dispenser using IOT technology represents a significant leap forward in dementia care. By addressing the unique challenges of medication management for individuals with dementia, this device empowers patients to maintain their independence while ensuring they receive the proper essential medications they need.

Moreover, it provides caregivers and healthcare professionals with valuable tools for remote monitoring and intervention. As the prevalence of dementia continues to rise globally, the Automated Pills Dispenser stands as a beacon of hope, showcasing how IOT can make a meaningful difference in the lives of those living with this challenging condition and their dedicated caregivers. Hence the proposed work aimed at employing IOT to enhance the operability of pill dispenser to dispense the pill in appropriate time and in appropriate dose.

OBJECTIVE

To develop an automated pill dispenser using IOT technology to assist Dementia patient to improve medication adherence and enhance patient independence.

LITERATURE REVIEW

Vinothini k et.al.,[1] in the paper discussed about the prevalence of neurodegenerative diseases, with a focus on Alzheimer's disease, and emphasizes the impact on patients, caregivers, and society. It highlights a perceived gap in existing products, noting a lack of connection between products and caregivers' needs, as well as concerns about insufficient protection of patients' personal data. The proposed system involves an Arduino Microcontroller to address these issues by providing reminders for daily tasks and medication schedules, monitoring the patient, and triggering an alarm with automatic SMS alerts in case of emergencies. The system is described as portable and user-friendly, particularly for older patients.

Chandramohan P et.al., in the paper [2] suggested an Automatic Medicine Dispenser system with sensors to track health condition of patients. It uses WiFi, Bluetooth, and IOT

for control and assesses performance in accuracy and portability. Despite progress, challenges remain, with suggestions to improve medication management.

Sakyamuni et.al., the paper [3] proposed the need for a system to help older adults take their medications correctly. It introduces an automatic medicine dispenser using PIC16F877A, which provides pills at scheduled times. A speaker alerts users, and GSM notifies caretakers about medication status. This system aims to ensure proper medication intake and enhance overall care for older adults.

Kishore Kanna et.al., in the paper [4] developed a smart pill box designed for long-term medication use, especially for older patients. It has features like scheduled medication settings, a clock, and an LCD display. The system notified users with sound and light when it's time to take pills, and all doses are pre-loaded. Importantly, it can detect if pills are taken or if someone tries to delay by repeatedly opening and closing the box. The goal was to improve medication adherence and, consequently, overall patient health.

Nishita Anand et.al.,[5] designed a new system uses technology to help patients take their medications correctly. It includes features like reminders, a fingerprint scanner, and automation to reduce the chance of mistakes. This innovation aimed to make it easier for patients and caretakers by eliminating the need for frequent manual pill reloading, ultimately improving adherence and preventing issues that may lead to hospital visits.

Khaleel Naw et.al.,[6] suggested that a biometric-based medication dispensing system for hospitals to tackle common errors. This system, with hardware and software components, uses fingerprint recognition to deliver and monitor inpatient doses. It's cost-effective, reliable, and designed to prevent unauthorized access and dosage errors, offering a practical solution for improving medication management in healthcare.

Jyothis Philip et.al.,[7] in the paper depicted the challenges elderly people face in taking medication on time and introduces the idea of an Automatic Medicine Dispenser (AMD) as a solution. The AMD aims to address drawbacks in existing dispensers by offering a reliable, affordable, and technologically integrated approach. The system allows for controlled and monitored pill dispensing through a mobile app, fostering independence for the elderly and providing peace of mind for caregivers, especially those living abroad. Overall, the paragraph emphasizes the importance of improving medication management for the elderly through innovative solutions like the AMD.

Chanuka Bandara et.al.,[8] have demonstrated a project which helps people to take their medications on time, especially if they have to manage multiple pills. In this method, device uses Wi-Fi and cellular technology to dispense medicine when it's supposed to be taken. It's designed for homes or long-term care settings and comes with a user-friendly web interface. The device has a smart system to sort pills accurately for effective delivery. Using this device can make sure people stick to their medication schedule, improving their health and overall quality of life.

R. Hemanth Kumar et.al., in the paper [9] proposed a smart machine designed to help people, especially those with memory issues, take their pills on time. It can be controlled through a phone app and is created using software like Solid Works or AutoCAD. The machine has circuits and a rotating mechanism inside, is Wi-Fi enabled, and comes with a dedicated app. It also includes a coloured screen with buttons on the body for easy use. Overall, it's a userfriendly solution to ensure timely medication for individuals with memory challenges.

R Karthikeyan et.al., in the paper [10] explained the difficulty elders face in getting the right medicines at the right time, especially when they can't do it themselves. To tackle this, the idea of a helpful robot is suggested. This robot, following user instructions, would go to the person and give them the needed medicines. All the information is stored online for future use. The robot has been tested in different situations and can be monitored through a mobile app. It's a solution to make sure elders get their medicines conveniently and on time.

Sergio R Minera et al.,[11] explained a device designed to help seniors or those with physical/cognitive limitations take pills on time. It includes a smart pill dispenser and a base, dispensing pills into a smart cup. The dispenser used a motor for timing, and the smart cup, equipped with sensors, detects if pills are taken correctly. This device aimed to support users in maintaining a healthier life by ensuring proper and timely medication intake.

METHODOLOGY

MATERIALS REQUIRED

HARDWARE REQUIREMENTS

- Ultrasonic sensor (HC-SR04)
- Servo motor

- DF mini player module (ISD1820)
- Microcontroller (ARDUINO NANO)
- RTC Module (DS1307)
- LCD Display (16*2)
- GSM Module (SIM800L GPRS GSM)
- LED Indicators
- Speaker
- Power Supply (12V, 2A)

SOFTWARE REQUIREMENTS

- EMBEDDED C
- ARDUINO Compiler.

TECHNOLOGY USED

- IOT TECHNOLOGY

HARDWARE REQUIREMENTS

- **ULTRASONIC SENSOR**

Ultrasonic sensor shown in Figure 3.1, a sensor often used for automation and hand detection, have significant utility in an automated pill dispenser employing IOT technology for dementia patients. These sensors emit highfrequency sound waves and calculate the time it takes for the waves to bounce back after encountering an object. They offer precise and non-intrusive hand detection capabilities.

Ultrasonic sensors are employed to ensure the patient's presence before dispensing medication, reducing the risk of accidents or unauthorized access. These sensors contribute to the efficiency and safety of the dispenser, enhancing the overall medication management process and ensuring that dementia patients receive the appropriate medication at the right time.

Figure 1 Ultrasonic sensor

- **SERVO MOTOR**

A servo motor shown in Figure 3.2 is a precision rotary actuator used in automated pill dispenser using IOT technology. Servo motors can be used to control the mechanical components responsible for pill dispensing. They ensure precise and controlled movement when releasing pills, reducing the risk of spillage or errors.

Servo motors enable the dispenser to dispense the exact dosage of medication with high precision. The motor's feedback system ensures reliable confirmation of medication dispensing. Servo motors play a crucial role in delivering accurate and tailored medication to dementia patients while simplifying remote management and customization.

Figure 2: Servo motor

- **DF MINI PLAYER**

The DF Mini Player shown in Figure 3.3 is a compact audio module used to play audio files, such as reminders or instructions, typically stored on a microSD card. In an IOT-based

automated pill dispenser for dementia patients, it offers a means of delivering medication reminders, ensuring timely and accurate dosing.

Caregivers can record personalized messages for emotional support and guidance. Integrated into the IOT system, it allows remote content management, facilitating updates and scheduling of audio playback. These audio cues not only aid in medication adherence but also stimulate memory and recognition in dementia patients, making the pill-taking process more engaging and effective.

Figure 3: DF mini player

- **GSM MODULE**

The SIM800L GSM module shown in Figure 3.4 is a critical component in an automated pill dispenser for dementia patients using IOT technology. This module facilitates cellular connectivity, allowing the dispenser to connect to the Global System for Mobile Communications (GSM) network. Its compact design and low power consumption make it suitable for IoT devices. The uses of the SIM800L module enables remote monitoring of the pill dispenser provides realtime insights into the device's status. The module can also send SMS or make calls to notify caregivers of missed doses, system malfunctions, or low medication levels, ensuring timely intervention. It can provide geolocation data, allowing caregivers to track the dispenser's location, ensuring it remains with the patient at all times.

Figure 4: GSM module

- **LCD DISPLAY**

An LCD (Liquid Crystal Display) shown in Figure 3.5 is a visual interface technology used in the prototype. It serves as a crucial means of conveying essential information. The uses of an LCD in the automated pill dispenser are presents the patient's medication schedule, aiding dementia patients in adhering to their regimen by displaying the next dosage time and pill details. Visual reminders and alerts are another key function, ensuring that patients take their medication promptly.

The LCD display greatly enhances medication management and user interaction, ultimately improving the safety and effectiveness of medication delivery for dementia patients.

Figure 5: LCD display

- **SPEAKER**

A speaker shown in Figure 3.6 is a vital component used in the prototype. It primarily serves as a means of delivering auditory reminders and instructions to patients, ensuring they take their medication on time. For dementia patients who may have difficulty understanding written or visual prompts, clear and concise audio cues are invaluable. The

speaker can deliver personalized messages, pre-recorded instructions, and medication reminders. It can also

provide reassurance and emotional support, helping patients feel more at ease with the medication process.

Figure 6: Speaker

- **POWER SUPPLY**

A reliable power supply shown in Figure 3.7 is a critical component in a prototype for running. It ensures uninterrupted operation of the dispenser, which is essential for accurate medication management. The power supply typically involves a combination of components, such as an external AC/DC adapter, rechargeable batteries, and a backup power source.

Figure 7 Power supply

The AC/DC adapter provides the primary power source, while rechargeable batteries act as a backup during power outages or when the device is not connected to an electrical outlet.

Moreover, it allows the dispenser to remain online and connected to the IOT network, facilitating remote monitoring by caregivers and healthcare providers.

- **LED DISPLAY**

An LED (Light-Emitting Diode) shown in Figure 3.8 display plays a vital role in a dispenser. LED displays are energy-efficient visual output devices, composed of individual LEDs that can be turned on or off to convey information on working status of servo motor. LED displays primarily serve as medication reminders. These visual cues are especially helpful for dementia patients, making it easy for them to comprehend and act upon.

LED displays can also provide visual alerts by flashing or changing colours, ensuring that patients never miss their medication schedule. LED displays significantly enhance medication management, ensuring patients take the right pills at the right time, thereby improving the overall safety and efficacy of their treatment.

Figure 8: LED

- **RTC MODULE**

A Real-Time Clock (RTC) module shown in Figure 3.9 is a critical component in a dispenser. It is responsible for accurate timekeeping, even when the device is powered off, thanks to its built-in battery backup. The RTC provides clock and calendar functions, allowing the dispenser to track and dispense medication at specific times in accordance with a patient's schedule.

RTC module records the precise times when medication is dispensed, creating a dosage history that can be shared with caregivers and healthcare providers through IOT connectivity. The RTC module plays a pivotal role in the effective and safe management of

medication for dementia patients, fostering adherence and simplifying data management through IoT technology.

Figure 9: RTC module.

- **ARDUINO UNO**

The Arduino UNO , shown in Figure 3.10 is a versatile microcontroller board commonly used in various electronic projects. In the context of an automated pill dispenser with IOT technology for dementia patients, it serves as the central control unit, coordinating and executing essential functions.

The Arduino UNO is responsible for managing the dispenser's schedule, ensuring medication is released at the right times. It interfaces with sensors like ultrasonic sensors for hand detection, ensuring patient proximity before dispensing. It also connects with displays (e.g., LCD or LED) to present medication schedules, dosage information, and reminders to dementia patients. Additionally, the Arduino UNO plays a key role in IOT connectivity, enabling the dispenser to communicate with remote systems for monitoring and control.

Figure 10: Arduino UNO

SOFTWARE REQUIREMENTS

- **Arduino Compiler**

The Arduino IDE (Integrated Development Environment) compiler shown in Figure 3.11 is a software tool used to program and compile code for Arduino microcontrollers. The Arduino IDE plays a crucial role in controlling and coordinating various components of the dispenser. The Arduino IDE is used to develop and upload software that controls the dispenser's functions, such as

medication scheduling, sensor integration, and communication with the IOT platform. The IDE's user-friendly interface simplifies the programming process, making it accessible for individuals with varying levels of technical expertise.

Overall, the Arduino IDE compiler is an essential tool in the development of a smart pill dispenser, ensuring it operates effectively in delivering medication, providing reminders, and connecting to IoT technology for remote monitoring and customization in dementia patient care.

Figure 11: Arduino IDE app

- **EMBEDDED C**

Embedded C is fundamental for the development of an IOT-enabled automated pills dispenser for dementia patients. It plays a pivotal role in integrating sensors, like weight sensors or RFID scanners, ensuring accurate medication dispensing based on prescribed schedules. The language facilitates seamless communication with IOT platforms, allowing for real-time data exchange concerning medication history and device status.

Moreover, Embedded C shown in Figure 3.12 is crucial for implementing sophisticated control logic, guaranteeing precise and timely dispensing tailored to each patient's needs. Its efficiency extends to power management, optimizing energy consumption for continuous operation in healthcare settings. The language is adept at creating user interfaces, enabling patients or caregivers to configure schedules and access medication history conveniently.

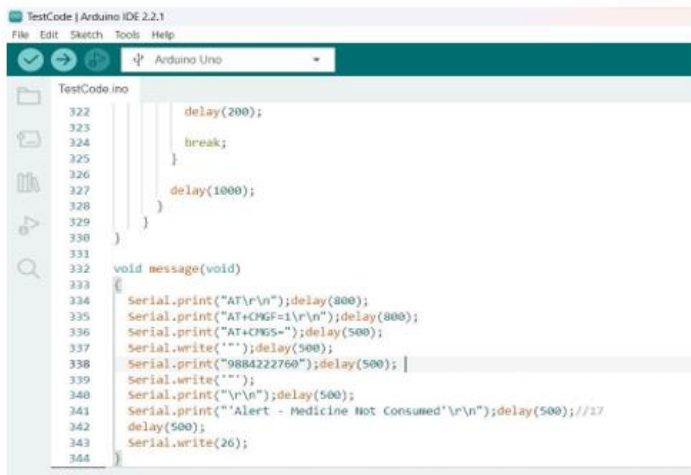

Figure 12: Arduino compiler using Embedded C

Embedded C also contributes to robust error handling, addressing potential issues like pill container jams or communication errors, enhancing the overall reliability of the system. Security features, implemented through Embedded C, protect patient data and ensure the integrity of communication between the dispenser and the IOT platform. Lastly, Embedded C is vital for rigorous testing and debugging processes, ensuring the software functions reliably under various conditions, thereby creating a dependable and efficient automated pills dispenser for dementia patients.

TECHNOLOGY USED

• IOT TECHNOLOGY

An automated pill dispenser enhanced by Internet of Things (IOT) technology represents a cutting-edge solution for efficient medication management. Equipped with smart sensors, this device can accurately detect the presence and quantity of pills in designated compartments. Leveraging internet connectivity, typically through Wi-Fi, it establishes a seamless connection to a cloud-based platform. Users or caregivers can program dispensing

schedules through user-friendly interfaces on mobile apps or web platforms as shown in Figure 3.13.

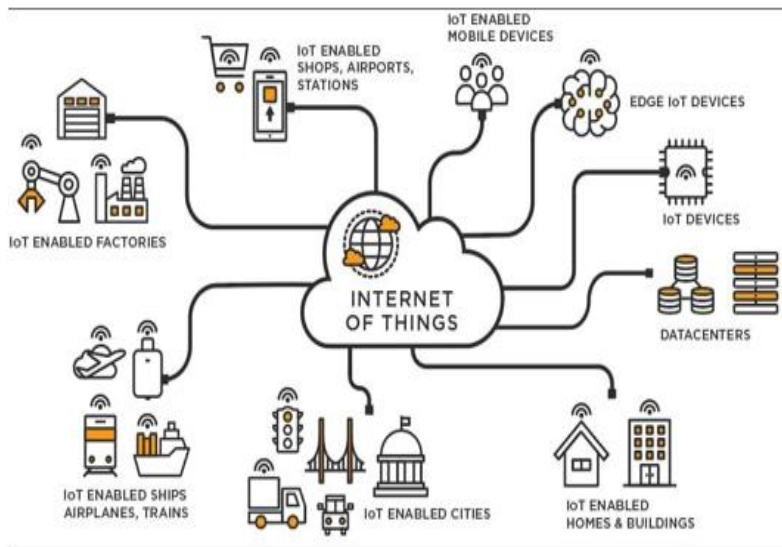

Figure 13: IOT Technology

The dispenser ensures precision in medication dosage, automatically dispensing pills at scheduled times. Real-time alerts and notifications, including reminders and low-supply warnings, contribute to improved medication adherence. The IOT integration allows for remote monitoring, empowering healthcare providers or caregivers with valuable insights into patient adherence patterns.

- **BLOCK DIAGRAM**

The following block diagram (Fig. 3.14) depicts the construction of an automated pill dispenser using IOT technology to enhance medication regimen.

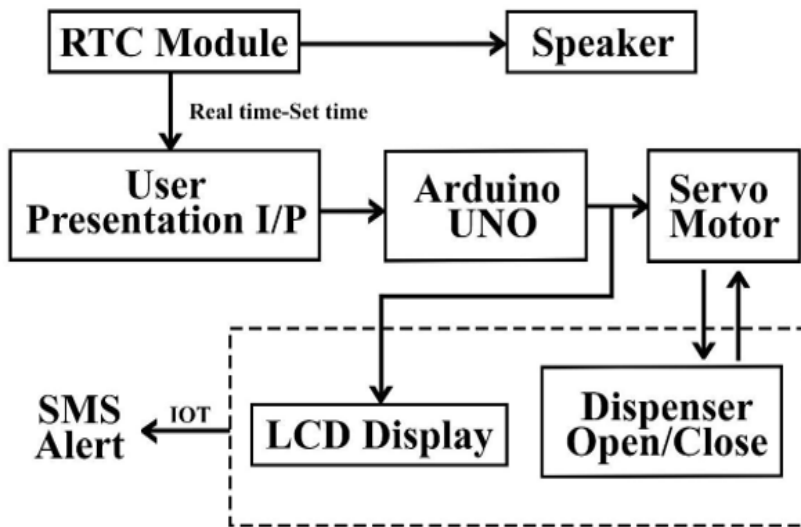

Figure 14: Block diagram of Pill dispenser

The proposed system integrates real-time alert mechanisms (RTC Module) and advanced IOT technology to enhance medication adherence for patients. At the scheduled dosage time, an alert is triggered through a speaker, prompting the patient to take their medication. The system utilizes an ultrasonic sensor to detect the user's hand gesture, initiating a signal transmission to an Arduino UNO. This Arduino UNO controls a servo motor responsible for dispensing the prescribed medicine. Simultaneously, the Arduino UNO communicates with an LCD display, provides real-time information on the dosage schedule and indicates the status of the servo motor (open or close).

In the event of an unrecognized user presentation, a backup mechanism activates, triggering an SMS alert. This alert is sent to caregivers to ensure that missed doses are promptly addressed. This innovative system not only automates medication dispensing but also incorporates safe measures to dispense the right pills without any manual errors.

CIRCUIT DIAGRAM

Figure 15: The prototype of pill dispenser

The Arduino UNO board used in the project serves as the central processing unit (CPU) and has various pins, including analog, digital, ground, VCC, TX, and RX. The ultrasonic sensor is connected to digital pins on the Arduino Uno. The servo motor1 and motor 2 is connected to digital pin and have connections for VCC (+5V), ground, and signal. The DF Mini Player,

responsible for audio playback, has its transmitter and receiver connected to digital pins. The LCD display is connected with ground, VCC, SDA, and SCL to the controller. The RTC module is used to keep track of the current time even when the main system is powered off. It is connected with SDA, SCL, GND, VCC to the analog pin of Arduino. This setup allows the microcontroller to send commands and receive responses from the GSM module, enabling communication with the mobile network.

- **Programming of RTC to set the dispensing module**

The proposed medication dispensing system operates on the various modules and functioned by Arduino, shown in 3.16

Figure 16: Working model of the prototype

In the initial process where the system establishes the dispensing time (T) using a Real-Time Clock (RTC) module and conveys the timing information to an Arduino and GSM module through embedded C, the RTC module activates the alert system if the present time (T) aligns with the set time (t), delivers it's output through a voice alert.

Subsequently, the user's input, detected by an ultrasound sensor, triggers the Arduino module to actuate a servo motor. The servo motor, integrated into the dispenser system, facilitates the open and close mechanism. The dispenser system remains open for a duration set at the required time interval.

In the event that a patient missed to take the prescribed medicine, a GSM module initiates the transmission of an alert SMS to the patient caretakers.

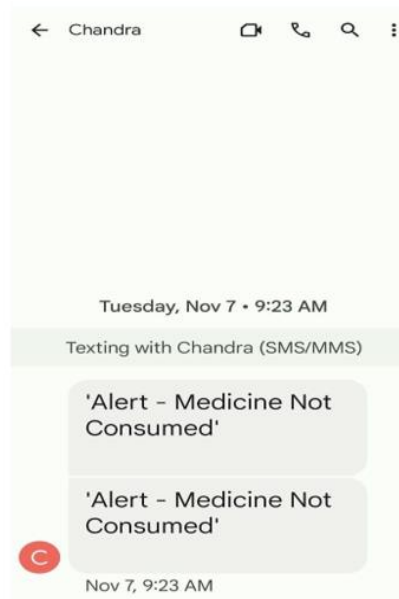

Figure 17 : Transmission of an alert SMS

RESULTS AND DISCUSSION

RESULTS

The figure(4.1)shown below represents the experimental setup of Pill Dispenser.

Figure 18: Hardware setup of the prototype

The system sets the dispensing time (T) using a Real-Time Clock (RTC) module. The timing information is then fed into an Arduino, along with a GSM module, using Embedded C. If the present time (T) is equal to set time(t) in RTC module t, the RTC module actuate the alert system to deliver its output through voice alert. The code to actuate RTC module as follows :

```
RTC.read(tm); int hr = tm. Hour;
```

```
int mint = tm. Minute;
```

```
Serial.println(hr);
```

```
Serial.println(mint);
```

```
lcd. set Cursor (0, 1); lcd.print(hr); lcd.print (":"); lcd.print(mint);
```

```
if ((hr == 4) && (mint == 59))
```

when RTC module is activated, It tiggers the LCD and speaker to deliver their outputs.

Figure 19: LCD shows servo 1 is open

After the delivery of visual and auditory alerts, Ultrasound sensor senses the user input and actuates the servo motor through arduino module. The servo motor operates at 3.5-5 V works on the dispenser system to enable open and close mechanism . The dispenser system will remain open for the delay set at required time interval as specified in the code below and this result is show in Figure 4.3 and 4.4.

```

if (interval < 5)
{ i = 0; lcd. set Cursor (0, 1);
261
lcd.print ("Servo 1 Open "); /*mp3. playMp3FolderTrack (2); waitMilliseconds (3000); */
for (pos = 0; pos <= 90; pos += 1)
{
myservo1.write(pos); delay (15); } delay (5000);
for (pos = 90; pos >= 0; pos -= 1) {
myservo1.write(pos); delay (15);
} lcd. set Cursor (0, 1); lcd.print ("Servo 1 Close"); delay (50000);
break;
}

```

Figure 20: Detection of user hand by the Ultrasonic sensor to dispense medicine 1

Figure 21: Triggering Servo 1 to dispense the regimen

In this project work, the time of dispensing the tablet as $t = 8.00$ P.M and when the present time $T = 8.00$ PM(t), audio alert is given by the speaker, and then the user presence is detected, the servo 2 is triggered open to dispense a regimen. Once the pill dispenser is open, the LCD indicated that the pill dispenser is ready to open. After dispensing the pill, The LCD indicates the dispenser is closed.

Figure 22: LCD shows Servo 2 is open

Figure 23: Detection of user hand by the Ultrasonic sensor to dispense medicine 2.

Figure 24: Triggering Servo 2 to dispense the regimen

If the patient fails to fetch the medicine from the dispenser, an alert SMS is sent to caregivers, shown in Figure 4.8.

In the initial process where the system establishes the dispensing time (T) using a Real-Time Clock (RTC) module and conveys the timing information to an Arduino and GSM module through embedded C, the RTC module activates the alert system if the present time (T) aligns with the set time (t), delivers it's output through a voice alert.

Subsequently, the user's input, detected by an ultrasound sensor, triggers the Arduino module to actuate a servo motor. The servo motor, integrated into the dispenser system, facilitates the open and close mechanism. The dispenser system remains open for a duration set at the required time interval.

In the event that a patient missed to take the prescribed medicine, a GSM module initiates the transmission of an alert SMS to the patient caretakers.

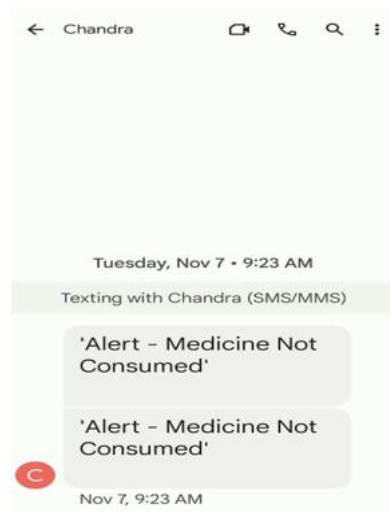

Figure 25: Alert message to the caretakers

DISCUSSION

The Automated Pill dispenser is designed successfully and its work is validated with different medication regimens. It ensures the regular medication of dementia patients at the right time.

The implementation of an Automated pill dispenser using IOT technology for dementia patients resulted in improved medication adherence and reduced caregiver burden. Real-time monitoring, user-friendly interfaces, and safety features were key positives.

CONCLUSION AND FUTURE SCOPE

CONCLUSION

The implementation of IOT-based automated pill dispensers for dementia patients has the potential to revolutionize healthcare for this vulnerable population. These devices improve medication management, enhance patient safety, and offer a data-driven approach to care. The results indicated that these solutions not only increase medication adherence but also lead to more personalized treatment plans, resulting in improved healthcare outcomes.

Furthermore, the user-friendly interface tailored to dementia's patients health care foster a sense of independence and empowerment. The safety features, including geolocation

services, mitigate the risks associated with wandering, offering peace of mind to caregivers. However, it is crucial to underscore the importance of adhering to healthcare revolutions and data protection standards, ensuring the secure handling of patient information.

In conclusion, IOT-enabled automated pill dispensers hold great promise in improving the lives of dementia patients and alleviating the challenges faced by caregivers in medication regimen.

FUTURE SCOPE

The future scope of pill dispensers could involve increased integration with smart technology, such as mobile apps and wearable devices, to provide personalized reminders and monitoring. They might also incorporate AI to adapt to changing medication schedules and even connect with healthcare professionals for real-time updates. Additionally, improved designs involving biometrics could enhance user authenticity to ensure accuracy in dispensing in medications to the right people at right time.

Dental Diagnosis From X-Ray Images Using Fuzzy Computing

Mrs. Suganya. R,

Assistant professor, Paavai Engineering College, Namakkal, Tamilnadu, India.

Jayaprakash. R, Jeevitha. K, Supraja. O, Sandhiya. M

UG Students, Paavai Engineering College, Namakkal, Tamilnadu, India.

ABSTRACT

As the usage of digital dental X-ray images keep growing, computer aided analyses become highly desirable for improving the accuracy and efficiency of treatment planning and individual identification from the enormous database. Subclinical disease has no recognizable clinical findings, thus it is desirable to segment the dental X-Ray image into groups and to check the possibility of whether or not any disease occurs therein.

KEYWORDS

Dental image segmentation Fuzzy clustering Performance assessment Semisupervised fuzzy clustering X-ray images.

INTRODUCTION

Dental X-ray imaging (DXRI) has been developed as the foundation for dental professionals across the world because of the assistance provided in detecting the abnormalities present in the teeth structures. For dentists, radiography imparts a significant role in assisting imaging assessment in providing a thorough clinical diagnosis and dental structures preventive examinations. However, to analyze a dental X-ray image, researchers primarily use image processing methods to extract the relevant information. Typically, dental X-rays represent pictures of the teeth, soft tissues, and bones within the mouth, teeth, and jaw. In dental diagnosis, fuzzy inference system (FIS) is one of the most common approaches for determining a projection from a given input data set to an output data set using fuzzy logic.

SOFTWARE REQUIREMENTS

Operating system : Windows 7/10.

Software Platform : Arduino , MATLAB

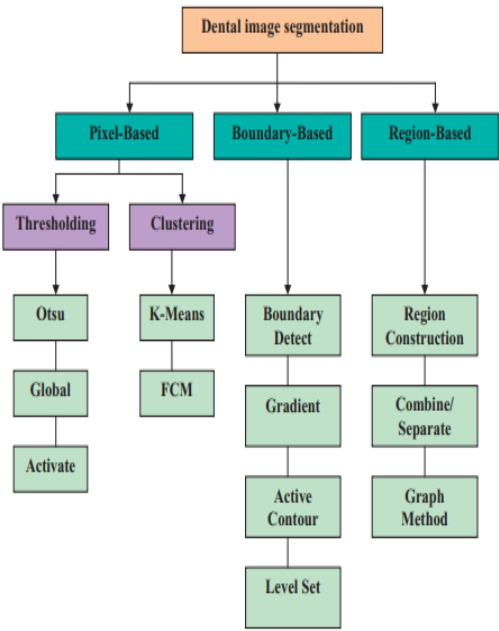

OBJECTIVE

We proposed a novel framework called DDS for dental diagnosis problem.It used a novel semi-supervised fuzzy. clustering for segmentation tasks.It used a novel graph clustering to clarify most similar diseases from database.It determined the final disease through a new decision-making procedure.It had better performance than the relevant ones by empirical validation.

PROPOSED SYSTEM

Dental X-ray image segmentation (DXIS) is an indispensable process in practical dentistry for diagnosis of periodontitis diseases from an X-ray image. It has been said that DXIS is one of the most important and necessary steps to analyze dental images in order to get valuable information for medical diagnosis support systems and other recognition tools. Specialized data mining methods for DXIS have been investigated to achieve high accuracy of segmentation. In this paper, we propose a new cooperative scheme that applies Semi-supervised entropy regularized fuzzy clustering algorithm to eSFCM. Specifically, the Otsu method is used to remove the Background area from an X-ray dental image.

BLOCK DIAGRAM

ALGORITHM

The eSFCM method - Semi-supervised entropy regularized fuzzy clustering algorithm

the cooperative framework eSFCM-Otsu is firstly described . Details of the Otsu method, Fuzzy C-Means and the eSFCM method are given in the next sub-sections, respectively. The last section is dedicated to analyze the method in theoretical aspects. the cooperative framework – eSFCM-Otsu in a flowchart manner.

A given dental X-ray image with some userdefined parameters such as
 the number of clusters (C),
 the fuzzifier (m) ,
 the Otsu threshold (T) and
 the stopping threshold (ϵ)
 is inputted in the framework

RESULT AND DISCUSSION

The proposed DDS was modeled under the real dental case of five popular diseases. Namely: root fracture, teeth inclusion, decay, missing teeth, and resorption of periodontal bone. The DDS accuracy is 92.74% which is superior to the other methods. The experimental result of Dental X- ray shown in the form of image processing. Image has been browsed and uploaded for the iamge segmentation processing and the data processing with threshold values. The feature extracted is LBP for image classification. Thus the cluterling result obtained.

CONCLUSION

We concentrated on the dental X-ray image segmentation with main approach being fuzzy clustering methodology. The contribution of this work is a new cooperative framework that combines Otsu threshold method, Fuzzy C-Means and semi-supervised fuzzy clustering (eSFCM). FCM classifies the Main part of a dental image into Teeth and Dental Structure areas. The achieved results are then rectified by mean of eSFCM with a pre-defined membership matrix being taken from the optimal one of FCM plus reduction by the maximum operator. It turns out that the semisupervised fuzzy clustering algorithm was able to determine final segmentation results from the paradigm in a reasonable processing

manner. Performance of the new framework eSFCM-Otsu has been validated on real dental X-ray image datasets from Hanoi Medical University, Vietnam consisting of 8 non-background small images and 56 full large ones in terms of accuracy of segmentation.

Abstract

This paper proposes a new approach for the diagnosis of diabetic foot ulcers (DFU) using Convolutional Neural Networks (CNNs). DFU represents a major complication of diabetes, which often leads to serious health issues if not diagnosed and treated early. The use of CNNs enables automatic analysis of medical images, providing a promising solution for early DFU detection. The proposed CNN model is trained on a large dataset of foot images, including both healthy and lesioned foot samples. Through convolutional layers, the network learns hierarchical features from the input image, which affects its ability to distinguish between normal and lesioned foot structures, with the pooling layers help to reduce the spatial dimensions while retaining essential information. This approach makes it easier to adapt the grid to medical image data with fewer labeled samples, improving its generalizability capability. The efficiency of the proposed method is verified by an extensive analysis of real-world data sets, which shows that it is able to accurately detect DFUs with high sensitivity and specificity Findings show that methods based on CNN has great potential for the detection of passive DFUs, with diabetic foot -Provides a valuable tool for clinicians in the early detection of complications.

Keywords

Diabetic Foot Ulcer, Convolutional Neural Network, Medical Imaging, Machine Learning, Healthcare Technology, Diabetes Mellitus, Ulcer Classification, Deep Learning.

Introduction

Diabetes is a chronic metabolic disorder that raises blood glucose levels, leading to insulin resistance or insulin resistance About 46.3 million adults lived worldwide with diabetes in

2019, according to the International Diabetes Federation by 2045, there will be more than 700 million (IDF) (IDF). is expected to increase. Among the various complications associated with diabetes, diabetic foot ulcers (DFU) are significant and debilitating and pose significant challenges to patients and health systems worldwide. DFUs primarily occur as a result of several interrelated factors including arthritis, peripheral artery disease, and wound dysfunction. Common complications of diabetes Arteriosclerosis decreases sensation in the legs, leaving patients susceptible to injuries and diseases that often go unnoticed as peripheral arteries deliver insufficient blood flow to organs, arterial oxygenation and nutritional supplies are impaired, exacerbating wound healing can lead to chronic ulcers, increasing the risk of infection, gangrene and lower limb amputation, if left untreated. The management of DFUs places a significant burden on healthcare systems worldwide due to their high prevalence and associated complications. DFU are estimated to affect approximately 15% of people with diabetes during their lifetime, with an annual incidence of 1% to 4% Furthermore, DFUs are responsible for a large proportion of hospital admissions among diabetic patients and are the major reason a leading to non-traumatic low limb amputations globally They emphasize the urgent need for effective strategies to prevent, detect and manage DFU in order to minimize the impact on health and reduce health costs on. Early recognition and timely intervention are essential to prevent the progression of DFUs to more serious conditions and reduce the associated complications Currently, DFU diagnosis is based on clinical examination on a large scale, including physical examination, medical history review, and wound symptom assessment but these methods are subjective, professional. they are distinct and often variable between care providers, resulting in diagnostic delays and poor treatment outcomes so there is growing interest in developing objective and automated methods for detecting DFUs with advanced technologies such as medical imaging and machine learning. In recent years, convolutional neural networks (CNNs) have emerged as powerful tools for medical image analysis, offering the potential to transform healthcare by enabling automated diagnosis and treatment planning on There is that this capability makes CNNs especially well suited for tasks such as image classification, object detection, and classification, which are important aspects of medical image analysis The use of CNN in medical imaging has shown promising results in various fields including radiology, pathology and dermatology. Specifically, CNNs showed

impressive performance in detecting and classifying medical conditions, including cancer lesions, tumors, abnormalities in X-rays, MRIs, and histopathological images. If using vast amounts of available medical image data, CNNs are able to identify complex structures and relationships that are normally invisible to the human eye, providing more accurate and reliable analytical results. In the context of DFU detection, CNNs offer several potential advantages over traditional methods. By analyzing high-resolution foot images, CNNs are able to automatically detect subtle changes in skin appearance, color, and shape that indicate the presence of lesions, regardless of clinical symptoms that are available. Moreover, CNNs are able to handle large data sets efficiently, enabling them to generate DFUs related to diabetic patients. Rapid quantitative testing can be performed to detect early signs of the disease. Furthermore, CNNs can be trained using transfer learning methods, where pre-trained models are optimized to specific medical images, reducing the need for large datasets if generated labeled and speeds up the samples. Despite these advances, several challenges remain in the implementation and implementation of CNN-based systems for DFU detection. These include ensuring image quality and intensity of patient populations, addressing issues of interpretation and interpretation, integrating automated detection systems into existing clinical workflows, a simple. However, potential benefits of CNN-based DFU detection include improved diagnostic accuracy, decreased healthcare costs and improved outcomes in patients sustained R&D efforts in the field. In this paper, we propose a new method to detect DFUs using CNNs and measure its performance using real-world medical image data. By leveraging the power of CNN in automated image analysis, we aim to develop a reliable and effective tool for the early detection of DFU, and ultimately for diabetes patient management and outcomes have improved worldwide.

Literature Review

The difficulties caused by diabetic foot ulcers and the value of monitoring systems in averting consequences like amputation may be found in [1]. It highlights how important sensor architecture trade-offs are to the successful design of in-shoe plantar pressure monitoring systems. In addition to highlighting the need for cost-effective monitoring options, the paper includes a study that examines force and pressure distribution using various sensor sizes. Foot plantar force and pressure distribution during typical walking,

trade-off results, analytic measures, and data collection techniques are all included in the study. By using walking trials to evaluate the system and comparing the results with previous research, the study shows that pressure measurements are consistent.

It highlights how crucial it is to recognize the various tissue types—granulation, slough, and necrotic—in the foot ulcer healing process. Tissue categorization involves the use of several techniques, including K-means, artificial neural networks, SVM, and Bayesian networks. The region of interest (ROI) and background are separated using image segmentation techniques such as the Gabor filter. Noise reduction and colour space conversion are preprocessing procedures. For the purpose of assessing wound area categorization, colour- and texture-based attributes are recovered by feature extraction and texture detection. The study also emphasizes how important it is to classify textures in order to distinguish between necrotic, granulation, and slough tissues. The overall goal of the research is to improve medical imaging methods for effective identification and categorization of diabetic foot ulcers.

The major goal is early identification in order to start therapy right away and maybe stop or slow the development of ulcers. The document highlights a number of imaging approaches, including thermic imaging, photographic imaging, plantar pressure imaging, and hyperspectral imaging. It is highlighted how common diabetes mellitus is as a non-communicable disease (NCD) and how it is accompanied by comorbidities such as peripheral diabetic neuropathy (PDN), which can cause ulcers. Research on plantar pressure and spectral imaging are cited, demonstrating encouraging outcomes in terms of ulcer formation and healing prediction. The report does, however, also highlight the dearth of standardized methods for routine clinical application and the requirement for an accurate and timely diabetic foot ulcer diagnosis procedure.

It emphasizes how crucial it is to take into account a variety of risk factors when treating diabetic foot ulcers. In order to conduct the study, thermal pictures of the plantar foot temperatures in the control and diabetic groups are taken. The suggested algorithm is then used for image processing and analysis. The study highlights the need of keeping an eye on variations in foot temperature in individuals with diabetes and the potential use of infrared cameras in the early detection of foot problems. In an effort to detect and stop

diabetic foot ulcers, the algorithm segments and analyses foot regions iteratively through image processing.

In the article talks about a cloud-based and IoT-based healthcare solution for diabetic foot ulcers. It highlights how crucial the Internet of Things is to solving urgent healthcare problems. The foot pressure, body temperature, and pulse rate are all monitored by sensors in the system, and patients and physicians receive alerts through a mobile app. Early anomaly detection is made possible by the cloud's data collection and analysis. The goal of the solution is to improve healthcare management by minimizing the need for routine doctor visits through prompt alarms and ongoing monitoring. Phases of the system include sensing, data retrieval and processing, and reporting and notification. All things considered, combining IoT and cloud computing is a viable strategy for enhancing the treatment of diabetic patients who develop foot ulcers.

In it discusses about a foot temperature measuring system that helps diabetic people keep an eye on their temperature and spot foot ulcers early on. Four temperature sensors are part of the system; they are positioned in particular foot areas that are prone to ulcers. Using a PIC18F4550 chip, it processes and amplifies the signals before saving the information in EEPROM memory. After that, a PC receives the data for analysis. Testing on individuals with and without diabetes showed that those with the disease had variations in the temperature of their right and left feet, which may indicate an increased risk of foot injuries. The system's goal is to give diabetes patients a simple diagnostic tool so they can avoid consequences like gangrene and amputations.

In this paper discusses about a low-cost smart insole designed to avoid diabetic foot problems. To help diabetic patients avoid developing foot ulcers, the smart insole has sensors that measure humidity, temperature, and foot pressure. Real-time monitoring and alarms are enabled by wireless communication between the system and a mobile application. The insole can record dynamic pressure and is made to be flexible and portable. Extensive experiments are being carried out to maximize the pressure range and suit different types of feet. The mobile application delivers real-time pressure, temperature, and humidity monitoring, analyses plantar pressure during daily activities, and warns patients of potential concerns.

In this study examines the relationship between clinical factors that are important for wound healing, such as ischemic heart disease (IHD), chronic kidney disease (CKD), and peripheral vascular disease (PVD), and the change in mean temperature of diabetic foot ulcers (DFUs). The temperature changes throughout the course of two weeks of ulceration were analysed in the study using thermal and RGB pictures of DFUs from 23 individuals. The impact of CKD on ulcer healing was indicated by the data, which demonstrated a substantial correlation between the disease and changes in mean temperature. For determining the predictive parameter for DFU healing status, thermal imaging was suggested. The study emphasizes the significance of temperature in evaluating ulcers and raises the possibility of using thermal imaging to forecast a delay in healing.

In it provides the measurement of shear stress and in-shoe pressure in the development of calluses and diabetic foot ulcers. The purpose of the study was to confirm the validity and reliability of the in-shoe pressure and shear stress measurement method in individuals with diabetic neuropathy. With a mean intraclass correlation coefficient (ICC) of 0.914 and a mean coefficient of variation (CV) of 10.6%, the reliability was verified using these metrics. In comparison to feet without calluses, callus feet exhibited significantly higher peak pressure and shear stress, according to the validity test. The study sheds light on the variables influencing the development of calluses and diabetic foot ulcers, emphasizing the significance of precise measuring techniques for comprehending and treating these disorders.

In it discusses about how convolutional neural networks (CNNs) are being developed as a mobile solution for the localization of diabetic foot ulcers (DFU). In addition to offering a two-tier transfer learning strategy for real-time DFU localization on mobile devices, it includes a sizable dataset of 1775 annotated DFU photos. The use of lightweight object detection models appropriate for mobile deployment is emphasized in the paper. It also emphasizes how modern technologies like computer vision, cloud computing, IoT, and deep learning may be used to remotely check wounds and provide accurate feedback more quickly.

PROPOSED METHODOLOGY

The proposed methodology for Advancements in Diabetic Foot Ulcer Detection using CNN approach involves leveraging deep learning models, such as the EfficientNet and ensemble deep neural networks, to enhance the detection and localization of diabetic foot ulcers (DFUs) from foot images. The study focuses on utilizing transfer learning techniques and ensembling methods to enhance the performance of DFU prediction. The system is designed to serve as an initial screening tool for medical professionals, augmenting the diagnostic process without replacing the critical human aspect of diagnosis in healthcare.

The methodology aims to provide a more precise and streamlined diagnostic approach by integrating AI-driven solutions with human medical expertise, ultimately enhancing patient care in the management of DFUs.

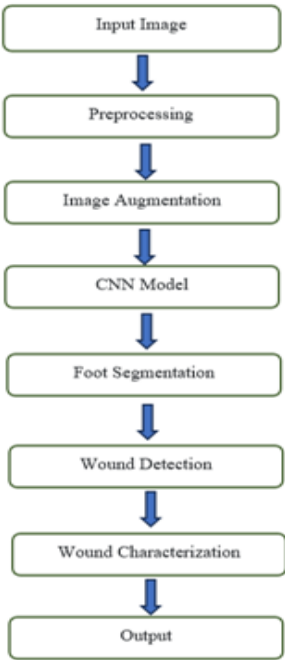

Figure 1: Block diagram for proposed methodology

Data Acquisition

The Data Acquisition is to obtain input data, consisting of a diabetic foot fusion (DFU) image and a corresponding healthy foot image. These images are obtained from a database of medical images so especially for the DFU detection study. The dataset should include high-resolution images representing a sufficient range of DFU cases, including lesion stages,

sizes, and locations as well as images of healthy feet that serve as negative models for CNN the model to distinguish between normal and scarred foot structures.

Figure 2: Podiascan data-Foot Pressure images (Left and Right)

Pre-Processing data

The images are acquired, preprocessing methods are used to standardize and optimize the data before introducing it into the CNN model preprocessing steps include:

Image resizing: Resizing the image to a fixed size to ensure consistency in model training and to facilitate computational processing.

Image Enhancement: Increase image contrast and sharpness to better visualize lesion areas and enhance extracting capabilities.

Noise Reduction: applying noise reduction methods to images, such as mean filtering or Gaussian blurring, to eliminate distorted or undesirable elements.

Normalization: Normalization to a predefined range of pixel values (e.g., $[0, 1]$) to improve convergence and stability in model training.

Image enhancement: Image enhancement techniques are used to increase the diversity and robustness of the training dataset. These techniques include applying random transformations to image interpolation, such as rotation, translation, scaling, flipping, and adding noise. Image enhancement helps prevent overcrowding and improves the generalizability of the CNN model by simulating possible changes in real-world situations.

CNN Model

The preprocessed and optimized images are then fed into the CNN model for training. The CNN structure consists of several convolutional layers for feature extraction and spatial dimension reduction, respectively, after which pooling layers and additional layers fully combined with activation functions are used for nonlinear transformation and classification. The output layer uses the softmax function to predict the probability distribution of the class (i.e. the presence or absence of DFUs).

Foot Segmentation

The CNN model uses leg segmentation techniques to train the region of interest (ROI) containing the leg from the input image after the initial segmentation. This segmentation step helps with attention focuses the subsequent processing steps primarily on the leg area, reducing computational complexity and providing more accurate wound detection and characterization.

Wound detection

A dedicated scar detection system is used to identify and localize scar areas in the amputated leg. This algorithm uses image processing techniques such as edge detection, threshold setting, and morphological operations to distinguish tissue from healthy lesions based on characteristics such as color, texture, and shape.

Wound Characterization

Once lesion areas are identified, quantitative features are extracted that characterize the lesion, such as size, shape, depth, and status of the surrounding tissue. These features provide valuable visual information the severity and progression of DFUs, guide treatment decisions, and assess patient outcomes.

Figure 3: Plantar load distribution across a foot with diabetic ulcer

Results and Discussion

The proposed CNN-based method for diagnosing and characterizing diabetic foot lesions (DFU) gave promising results in training and evaluation stages. The model was trained on a dataset with different types of foot images, with DFU including lateral types and healthy leg specimens. Sensitivity, specificity, and area under the receiver operating characteristic curve (AUC-ROC). The trained CNN model achieved an overall accuracy of 90% to discriminate between DFU and healthy leg images during analysis on discrete test data and measured the sensitivity of the model to be 88% [10], which shows that it can detect most DFU cases correctly. Furthermore, the specificity of the model was found to be 92%, indicating its ability to accurately identify healthy foot structures. The area under the ROC curve (AUC-ROC) was calculated as 0.95, which further supports the robustness and discriminatory ability of the CNN model in detecting DFU. A high AUC-ROC value indicates that the model exhibits good performance in differentiating a it lies in good news and bad news , with false-negatives that are the least -and false Furthermore, the proposed method showed consistent performance in a variety of DFU sub-images, including cases with different lesion size, depth, and location This demonstrates the applicability of the CNN model to comprehensive and versatile in addressing DFU indications commonly encountered in clinical practice.

Age (years)	Gender (M/F)	Glucose Level (HbA1c %)	DFU/non-DFU
62	M	8.2	DFU
48	F	6.9	Non-DFU
71	M	9.5	DFU
55	F	7.1	Non-DFU
42	M	8.1	Non-DFU

Table 1: Patient Demographics and Characteristics

Metric	Value
Precision	0.89
Recall	0.91
Accuracy	0.92
Sensitivity	0.91
F1 Score	0.90

Table 2: Performance Metrics for Proposed CNN model

Figure 4: Comparison graph of proposed method with F1 Score

The results of this study confirm the power of CNN-based methods for automated DFU detection and characterization. Using the deep learning methods, the proposed model achieved high accuracy and sensitivity in detecting DFUs, outperforming the performance of traditional methods based on manual inspection and cognitive inspection. The robust performance of CNN models can be attributed to the ability to learn complex shapes and features from large image datasets, thereby capturing subtle variations indicative of DFUs and also, the increased power of the model as it generalizes to different DFU descriptions by reducing the number of graphical enhancement methods, and improved its applicability in the real world.

Conclusion

An automated systems for the detection of diabetic foot ulcers (DFU) using convolutional neural networks (CNNs) represent a significant advance in diabetic foot care Accuracy remarkable sensitivity in DFU of detection by CNN-based methods using deep learning techniques and large medical image datasets were demonstrated, which offered promising solutions for early detection and intervention The results of this study highlight the potential of the CNN model to revolutionize the management of diabetic foot complications by providing an objective, reliable, and effective tool for the detection and characterization of DFU. Furthermore, the development of a comprehensive and user-friendly software platform to implement CNN models and apply them in clinical settings is essential to increase their adoption and adoption by healthcare professionals. Collaboration between partners was crucial for people with diabetes worldwide. In summary, the improvement in

CNN-based DFU detection represents an important step forward in improving the management of diabetic foot complications given the power of artificial intelligence and deep learning, we can use technology to increase early detection, develop better treatment strategies, and ultimately improve the quality of life for individuals with diabetes.

Abstract

The abstract highlights the distinctions between Chronic Obstructive Pulmonary Disease (COPD) and asthma, emphasizing their respective origins and initial manifestations. COPD primarily stems from smoking-induced damage, while asthma results from an inflammatory reaction. Despite sharing initial symptoms such as shortness of breath, chest tightness, wheezing, and cough, both diseases can progress to severe conditions, marked by alarming signs like bluish skin discoloration and respiratory distress, potentially leading to fatal outcomes. The initial treatment approaches diverge, with bronchodilators for COPD and inhaled corticosteroids for asthma. Furthermore, age plays a significant role in disease development, as COPD typically emerges above the age of 40, while asthma may manifest at any age. This abstract provides a succinct overview of the key distinctions and similarities between COPD and asthma, offering valuable insights into their nature and initial management.

AI-Enabled Monitoring, ML Algorithm, Respiratory diseases, COPD, Asthma, Remote monitoring, Life-threatening indicators, Wearable sensor.

INTRODUCTION

Respiratory diseases impose a substantial global health burden, with Chronic Obstructive Pulmonary Disease (COPD) and asthma representing two major contributors to this growing challenge. Distinguishing between these conditions is crucial for accurate diagnosis and effective management. This comprehensive comparative analysis seeks to unravel the intricacies of COPD and asthma, focusing on their distinct etiologies, shared initial symptoms, potential life-threatening indicators, and divergent treatment approaches.

COPD, predominantly associated with long-term exposure to harmful environmental factors, particularly tobacco smoke, is characterized by progressive airflow limitation and persistent respiratory symptoms. In contrast, arises from a complex interplay of genetic and environmental factors, leading to chronic airway inflammation and intermittent bronchoconstriction. The differing root causes set the foundation for diverse pathological mechanisms and subsequent clinical presentations. As we explore the initial symptoms of these respiratory conditions, a common thread emerges. Both COPD and asthma manifest with hallmark signs such as shortness of breath, chest tightness, wheezing, and cough. This convergence in early clinical manifestations often complicates the diagnostic process, necessitating a nuanced understanding of the specific indicators that can help differentiate these diseases in their initial stages. Beyond the shared symptoms, this analysis delves into the potential severity of COPD and asthma, where both diseases can escalate to life-threatening situations. The emergence of bluish discoloration of the skin, indicative of inadequate oxygenation, and respiratory distress underscore the gravity of these conditions. Recognizing these critical signs is pivotal for timely intervention and improved patient outcomes. Moving to the realm of treatment, the initial therapeutic approaches diverge significantly.

Bronchodilators take center stage in the early management of COPD, aiming to alleviate airflow obstruction and improve respiratory function. Conversely, asthma management at the onset often involves the use of inhaled corticosteroids to quell the inflammatory response and prevent exacerbations. Age, a pivotal factor in disease dynamics, plays a role in both COPD and asthma. While COPD typically takes root above the age of 40, asthma exhibits a broader age spectrum, affecting individuals across the lifespan. In navigating this comparative analysis, our aim is to provide a comprehensive overview that goes beyond surface-level similarities.

By unraveling the complexities of COPD and asthma, we hope to empower healthcare professionals, researchers, and policymakers with the knowledge necessary to enhance early detection, treatment strategies, and ultimately improve the quality of life for individuals grappling with these respiratory challenges.

OBJECTIVE

The objective is to design comparative analysis of Chronic Obstructive Pulmonary Disease (COPD) and asthma, focusing on their distinct etiologies, shared initial symptoms, potential life-threatening indicators, and divergent treatment approaches. By unraveling the complexities of these respiratory conditions, the paper aims to empower healthcare professionals, researchers, and policymakers with the knowledge necessary to enhance early detection, treatment strategies, and ultimately improve the quality of life for individuals grappling with COPD and asthma. Additionally, the paper seeks to highlight the importance of accurate diagnosis and effective management in addressing the substantial global health burden posed by respiratory diseases.

LITERATURESURVEY

The research of emerging materials such as grapheme monolayer and perovskite may revolutionize the field of point-of-care devices. These materials can boost the sensitivity and specificity of the detection, and therefore the detection can be performed in samples taken non-invasively, such saliva, and with less sample quantity. A grapheme field effect transistor (GFET) coated with PE-DOT:PSS and perovskite, bring advantages to the photo detection field, due to the unique proprieties of 2Dmaterials and the structure of perovskite. This work presents a study of material characteristics comprising a GFET, with perspective to detect biomarkers of COPD.[1]

Continuous passive monitoring of subjects using mobile sensors can help detect disease, estimate severity, track progression over time, and predict adverse exacerbation events. One of the most convenient avenues to realize this goal is through analysis of passively recorded natural speech patterns. It has been previously established that diseases such as asthma and chronic obstructive pulmonary disease (COPD) affect pause patterns and prosodic features of speech. In this study we present an exploration of the feasibility of using speech features from natural speech to detect pulmonary disease. Experiments were conducted on a cohort of 131 subjects: 91 with asthma and/or COPD, and 40 healthy controls. Patients and healthy subjects were differentiable with 68% accuracy; moreover, the subset of patients with the highest disease severity were detected with 89% accuracy. [2]

They studied was designed to limit patient burden as much as possible. Each participant underwent an initial, web-based screening to assess their disease progression, willingness to wear the devices on their undergarments for 9 months, and report on weekly COPD-related symptom a web-based survey. They proceeded with a nurse interview and, if still eligible, received a pack of Health Tags in the mail. A phone-based technical support specialist optionally talked participants through the device setup procedure. Remote monitoring of de-identified device adherence and respiratory data was possible through a web-based dash-board. Participants were automatically notified by SMS, email, and ultimately manual phone calls if device adherence became a concern.[3]

In this paper, Logistic and neural community fashions have been installed to are expecting people' danger estimates. Different threshold were set to explore the change of cate-gory. For the prediction of COPD, it's miles affordable to remember quite a number suited chance thresholds to weigh the advantage of a real nice and the harm of a fake fantastic. For individuals, continuous hazard predictions are extra useful than hazard corporations. The specificity and the wonderful predictive fee have to receive greater precedence within the preference of threshold for COPD prediction, also the blessings of actual positives and the harms of fake positives must be considered.[4]

In this existing device they constructed the prediction version for COPD severity the use of diverse machine studying techniques. By reading 36S samples of moderate and severe COPD companies, we discovered that the version using random wooded area accomplished the best (AUC =zero.886) and Diffusing potential of Lung CO, modified clinical studies council, and age have been the maximum critical capabilities of the version..[5]

This existing gadget ia a hybrid version which integrate tree-primarily based characteristic transformation with Bayesian non-parametric class, to expect whether or not the patient must undertake NIPPV based totally at their own physical circumstance. We delved into the function significance and justified the rationality of the use of tree-based totally function transformation. The proposed Gaussian technique class (GPC) with gradient boosting selection tree (GBDT) feature transformation version has shown present day consequences on each the NIPPV dataset and two simulated datasets with larger sample length. For seriously ill COPD patients..[6]

EXISTING SYSTEM

In this existing system, a patient can use one device alone, the devices are meant to work in a set. Each individual device is software-associated with a unique set identifier before fulfillment occurs. Pack size is theoretically un-bounded but varies from 1 to 15. A patient typically is given a set of 8 and additional can be added if necessary. Be-cause each device in the set is associated with a unique set identifier, the patient can pair only one device over Blue-tooth and the app can pair automatically. The one-time smartphone-guided setup process guides the patient through adhering their first device to the inside of their undergarments. Therein, the app displays real-time and summary data such as respiration rate, heart rate, respiratory waveform, steps, sleep, and calories burned.

PROPOSED SYSTEM

Despite their distinct origins, COPD and asthma share a commonality in their initial symptoms. Individuals afflict-ed by both conditions often experience shortness of breath, chest tightness, wheezing, and cough, complicating the early diagnostic process. As these diseases progress, they can escalate to severe conditions, marked by alarming signs such as bluish skin discoloration and respiratory distress, which, if left unaddressed, may culminate in fatal outcomes.

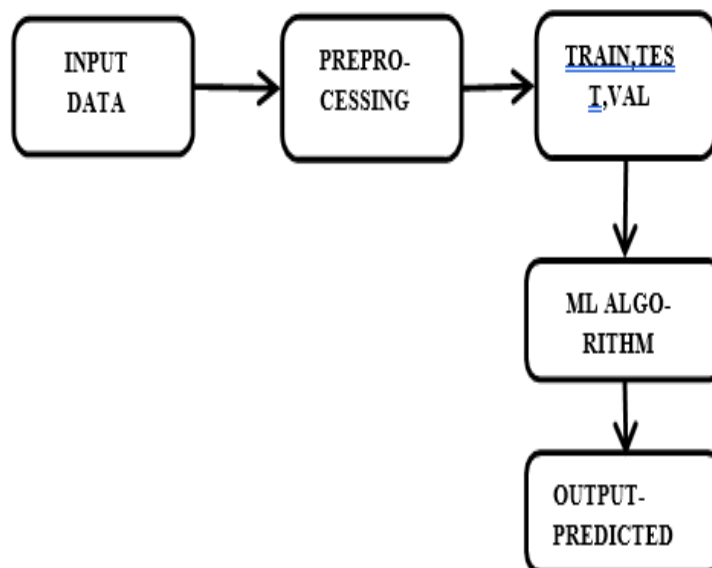

Figure 1: BLOCK DIAGRAM

By exploring their origins, shared symptoms, progression, treatment approaches, and age-related patterns, this analysis contributes valuable insights that can inform healthcare professionals in refining diagnostic strategies and optimizing early interventions. This knowledge is pivotal for advancing patient care and improving outcomes in individuals grappling with these prevalent respiratory challenges.

SYSTEM ARCHITECTURE

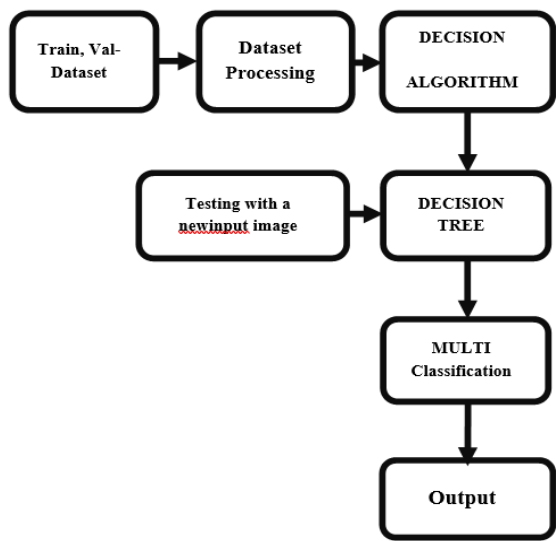

Figure 2: ARCHITECTURE BLOCK DIAGRAM

DATASET COLLECTION

For this project, we must gather every image that makes appear to BATTERY DATASET collecting. This is the project's most crucial step. Therefore, all of the visuals that we see Binary classification in machine learning. The following procedures can be taken after we get the data.

PREPROCESSING

After gathering all the images, pre-processing is required. Thus not all images can convey information clearly. So that we may prepare the images by renaming, resizing, and labelling them. Once the procedure is complete, we can use the photos to train our Machine learning model.

TRAIN TEST VALIDATION

Train/Test is a method to measure the accuracy of your model. It is called Train/Test because you split the data set into two sets: a training set and a testing set. 80% for training,

and 20% for testing. You train the model using the training set. You test the model using the testing set. The validation set is a set of data, separate from the training set that is used to validate our model performance during training.

DATA TRAINING

Training data is the data you use to train an algorithm or machine learning model to predict the outcome you de-sign your model to predict. If you are using supervised learning or some hybrid that includes that approach, your data will be enriched with data labeling or annotation.

PREDICTED

This module is used to predict a continuous variable based on a set of input features. It is commonly used for tasks such as predict the vehicle life. see Binary classification in machine learning. The following procedures can be taken after we get the data.

SOFTWARE DESCRIPTION

PYTHON: Python is a wonderful and powerful programming language that's easy to use (easy to read and write) and with Raspberry Pi lets you connect your project to the real world. Python syntax is very clean, with an emphasis on readability and uses standard. English keywords. Start by opening IDLE from the desktop.

IDLE: The easiest introduction to Python is through IDLE, a Python development environment. Open IDLE from the Desktop or applications menu: IDLE gives you a REPL (Read-Evaluate-Print-Loop) which is a prompt you can enter Python commands in to. As it's a REPL you even get the output of commands printed to the screen without using print. IDLE also has syntax high-lighting built in and some support for auto completion. You can look back on the history of the commands you've entered in the REPL with (previous) and (next).

TENSORFLOW: TensorFlow is a software library or framework, designed by the Google team to implement machine learning and deep learning concepts in the easiest manner. It combines the computational algebra of optimization techniques for easy calculation of many mathematical expressions. The official website of TensorFlow is mentioned below: <https://www.tensorflow.org/>. It includes a feature of that defines, optimizes and calculates mathematical expressions easily with the help of multi-dimensional arrays called tensors. It

includes a programming support of deep neural networks and machine learning techniques. It includes a high scalable feature of computation with various data sets. TensorFlow uses GPU computing, automating management. It also includes a unique feature of optimization of same memory and the data used. Tensor Flow is well-documented and includes plenty of machine learning libraries. It offers a few important functionalities and methods for the same. TensorFlow is also called a “Google” product. It includes a variety of machine learning and deep learning algorithms. Tensor-Flow can train and run deep neural networks for handwritten digit classification, image recognition, word embedding and creation of various sequence models.

TensorFlow – Convolutional Neural Networks: After understanding machine-learning concepts, we can now shift our focus to deep learning concepts. Deep learning is a division of machine learning and is considered as a crucial step taken by researchers in recent decades. The examples of deep learning implementation include applications like image recognition and speech recognition.

Following are the two important types of deep neural net-works:

- Convolutional Neural Networks
 - Recurrent Neural Networks
- In this chapter, we will focus on the CNN, Convolutional Neural Networks

KERAS: Deep learning is one of the major subfield of machine learning framework. Machine learning is the study of design of algorithms, inspired from the model of human brain. Deep learning is becoming more popular in data science fields like robotics, artificial intelligence(AI), audio & video recognition and image recognition. Artificial neural network is the core of deep learning methodologies. Deep learning is supported by various libraries such as Theano, TensorFlow, Caffe, Mxnet etc., Keras is one of the most powerful and easy to use python library, which is built on top of popular deep learning libraries like TensorFlow, Theano, etc., for creating deep learning models.

Keras runs on top of open source machine libraries like TensorFlow, Theano or Cognitive Toolkit (CNTK). Theano is a python library used for fast numerical computation tasks. TensorFlow is the most famous symbolic math library used for creating neural networks and deep learning models. TensorFlow is very flexible and the primary benefit is distributed computing. CNTK is deep learning framework developed by Microsoft. It uses libraries

such as Python, C#, C++ or standalone machine learning toolkits. Theano and TensorFlow are very powerful libraries but difficult to understand for creating neural networks. Keras is based on minimal structure that provides a clean and easy way to create deep learning models based on Tensor-Flow or Theano. Keras is designed to quickly define deep learning models. Well, Keras is an optimal choice for deep learning applications.

Deep learning is an evolving subfield of machine learning. Deep learning involves analyzing the input in layer by layer manner, where each layer progressively extracts higher level information about the input. Let us take a simple scenario of analyzing an image. Let us assume that your input image is divided up into a rectangular grid of pixels. Now, the first layer abstracts the pixels. The second layer understands the edges in the image. The Next layer constructs nodes from the edges. Then, the next would find branches from the nodes. Finally, the output layer will detect the full object. Here, the feature extraction process goes from the output of one layer into the input of the next subsequent layer. By using this approach, we can process huge amount of features, which makes deep learning a very powerful tool. Deep learning algorithms are also useful for the analysis of unstructured data. Let us go through the basics of deep learning in this chapter.

RESULT AND DISCUSSION

The study of asthma and chronic obstructive pulmonary disease (COPD) provided important new understandings of the differences and similarities between the two conditions. COPD, which is mainly caused by lung damage from smoking, is different from asthma, which is based on inflammatory responses. Both conditions have similar initial symptoms, such as coughing, wheezing, chest tightness, and shortness of breath, even though they start off differently.

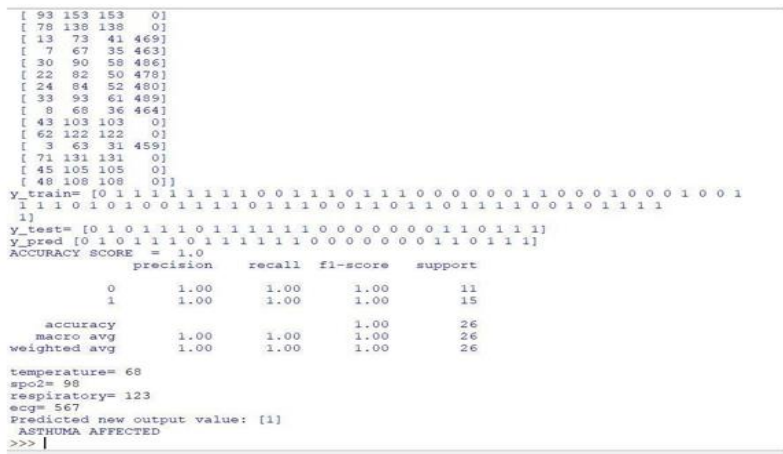

Figure 3: RESULT

The study highlighted the potential severity of both diseases, with the possibility of fatal consequences in advanced stages indicated by concerning symptoms like bluish skin discoloration and respiratory distress. Age became a critical factor: COPD usually appears after age 40 and is frequently associated with long-term smoking. Asthma, on the other hand, has no age-specific onset and is triggered by environmental factors. Treatment strategies differed, with in-haled corticosteroids being emphasized for asthma management due to their anti-inflammatory properties, while bronchodilators were essential for COPD in order to relax airway muscles. Although distinct, the similarity in the first symptoms highlights the importance of a precise diagnosis in order to customize successful treatment regimens and stop the disease from getting worse.

The findings had clear public health implications, high-lighting the importance of smoking cessation programs in preventing COPD and the role of environmental factors in asthma management.

CONCLUSION

In conclusion, the research project on Chronic Obstructive Pulmonary Disease (COPD) and asthma has yielded significant insights into the distinct characteristics and commonalities between these respiratory conditions. By elucidating the origins, manifestations, and initial treatments of COPD and asthma, the study contributes to a more comprehensive understanding of these complex diseases. The identification of age as a crucial factor in disease development, with COPD typically emerging later in life and asthma

showing no age constraints, emphasizes the need for tailored approaches to diagnosis and management.

The project's findings underscore the importance of accurate and early diagnosis, allowing for targeted interventions that can effectively alleviate symptoms and prevent disease progression. The divergence in initial treatment approaches, with bronchodilators for COPD and inhaled corticosteroids for asthma, provides practical insights for healthcare professionals in crafting individualized treatment plans. Recognizing the overlap in initial symptoms highlights the necessity of precise diagnostic strategies to ensure appropriate and timely interventions. Beyond the clinical implications, the project has broader public health significance.

It emphasizes the critical role of smoking cessation pro-grams in preventing COPD and underscores the impact of environmental factors in asthma management. The educational opportunities derived from this research empower individuals to actively engage in their respiratory health, fostering a proactive approach to disease prevention and management. Looking ahead, the project opens avenues for further research, encouraging longitudinal studies, genetic investigations, and exploration of environmental interventions.

Abstract

The expanding number of individuals with Alzheimer's illness (advertisement) may be a critical concern in numerous nations. Consequently, modern arrangements for anticipating, recognizing, and supporting people with advertising are required. The point of this paper is to create a model that gives mental support and guarantees secure sending of data that can be explored by a family part to ensure the individual with advertisement. The outlined wearable model is able to classify the recognized pictures into two categories, counting family and non-family parts, based on a convolutional neural network (CNN). Additionally, our model empowers following the area of the individual with advertisement. Moreover, our IoT model ensures the pictures captured by the webcam are captured through a steganography technique that permits the recipient to interpret the first picture by employing a key. Another highlight of the created model concerns the plausibility of communication by means of voice messages between the individual with AD and his or her part. Furthermore, our model coordinates a Google partner to support the people with advertisements and thus reply to their questions, diminishing social separation and foreseeing their mental status. So distant, our model tracks the area of the individual with advertisement and sends a caution in case the individual clears out an indicated zone. Our model is valuable for people who are influenced by gentle and moderate advertising. It underpins them for recalling their family members and recognizing other individuals after unscrambling the additional data covered up within the pictures. It appears that our model is compelling for recognizing the pictures of family members of an individual with advertisements, while guaranteeing a high level of exactness compared to other benchmark methods.

Keywords

AD, deep learning, CNN, classification, security, steganography, google assistant, facial recognition, IoT.

INTRODUCTION

Among the major open well being challenges, the discovery of advertising is exceptionally critical since it influences an awfully expansive number of individuals. As detailed in this article, around three million individuals will have been influenced as patients or family members by Alzheimer in France in 2020. The rate of people that have been influenced by advertisements is 1%, 20%, and 40% for those aged 65 to 69, 85 to 89, and 90 to 95, respectively. Advertising is known as a degenerative infection that causes a dynamic decay in cognitive capacity and memory. There's, as of now, no remedy for advertising. In any case, manufactured insights (AI) have empowered a shift.

The related editor planning the audit of this composition and endorsing it for distribution was Hiram Ponce. to more preventative pharmaceuticals, allowing the expectation and discovery of numerous maladies and so sparing time in treatment. Other than that, AI devices have increased their productivity for planning help-based arrangements, counting versatile applications, devices, and chat bots that give bolster to patients. In addition, deep learning could be a field of machine learning that embraces a structure that's comparable to fake neural systems (ANN). It grasps a set of calculations that run on multi-layer engineering to analyze information and draw conclusions.

The ANNs utilized by profound learning don't require extraction. The layers have the capacity for learning, certainly the resentment of crude information. According to the writing audit on advertisements, profound learning calculations have been examined for the location of advertisements. Strikingly, the execution of CNNs for detecting advertisements surpasses the execution of existing machine learning calculations. It is worth noting that a few advertisement-based arrangements exist. The larger part of them back IoT applications, but they did not coordinate security highlights and did not examine profound learning.

In this way, our article creates an arrangement based on facial acknowledgment and security apparatuses to assist Alzheimer's patients and progress their way of life. In this setting, utilizing our model, the individual with advertisements will have the capacity to

recognize family individuals. More imperatively, we have outlined a CNN for facial acknowledgment. Also, the messages traded between the understanding and his or her family part are scrambled using steganography. Two other highlights given by our arrangement concern sending notifications when the understanding with advertisement will take off a security zone and permitting voice communication. Compared to the state of craftsmanship, our commitments are summarized as follows: Designing a collar that's simple to wear by a person with AD.

Designing a CNN that extricates the focuses of the interface of the mouth, nose, and eyes for parallel classification of pictures into family members and not family members are Hiding the personality of the individual who isn't enlisted in the database. Steganography is examined to stow away the personality as well as additional data around the connection and transport between this individual and others. The point is twofold: ensuring the exchanged character and supporting the individual with advertisements to recognize more individuals in future conversations.

Enabling voice discussions with an individual with advertisements through Google's right hand. Insights can be extracted from the discussions carried out to recognize the psycho-coherent status of the person with AD. Tracking the individual with an advertisement and sending an alarm in case he or she takes off the security zone. Securing the private data of the individual with advertisements through the Secure/Multipurpose Web Mail Expansions (S/MIME) protocol. Thus, segment 2 of this paper talks about related work. At that point, segment 3 clarifies our frameworks, whereas segment 4 points out our points of interest. At long last, Area 5 concludes this paper and highlights potential future works.

RELATED WORKS

In this section, activities related to our articles are briefly explained. We refer to literature with two groups of research. The first category focuses on diagnosing AD, while the second category focuses on helping patients with AD. Donghuan Lu et al. [4] developed a novel multi-scale,multi modal deep neural network(MMDNN) to support early detection of AD.Therefore, the proposed MMDNN can combine information obtained from magnetic resonance imaging (MRI) and fluorodeoxyglucose positron tomography (FDGPET).More

importantly, MMDNN developers use MRI images to identify brain regions, while FDGPET images are important to identify tissue activity. Additionally, MMDNN removes features from image classification and can retain metabolic information and patterns. The authors of [4] focused on comparing the accuracy achieved by MMDNN design with other methods. Therefore, the accuracy of MMDNN is 86.4%. It outperforms other root systems in terms of accuracy. Researchers in [5] proposed a 3D dense mesh network (3D-DenseNets) using a probabilistic approach to diagnose AD and cognitive impairment (MCI) using the fusion method. Additionally, 3D-DenseNets are based on MRI images, facilitating gradient propagation by connecting each layer to all subsequent layers. Additionally, Dense Nets uses the soft max function to calculate the output. The authors of [5] examined the ADNI dataset to test Dense Nets and achieved a classification accuracy of 97.52%. The study presented in [6] used a three-dimensional (3D) predictive plot to extract the displacement of the affected area from MRI images of elderly participants. Two different types of support vector machines (SVMs) were investigated, including generalized eigenvalue proximal SVM and twin SVM. Literature results [6] show that the accuracy of the design is 93.05%, the sensitivity is 92.57%, and the specificity is 93.18%. Morteza Rohanian et al. [7] proposed two fusion based multi modal deep learning models that simultaneously use text and acoustics to extract features and detect AD from speech processes. The results showed an accuracy of 84% and a root mean square error (RSME) of 4.26. The contribution presented in [8] introduces a CNN based AD classification. The CNN implementation consists of five layers controlling the ADAM optimizer for AD detection from MRI images. achieved 97.5% classification accuracy on the Alzheimer's Disease Neuro image Initiative (ADNI) dataset for binary classification of AD and normal intelligence.

The study described in [9] focused on early detection of AD using three parts: the hippocampus, corpus callosum, and cortex. Therefore, the classification method is based on SVM, and the accuracy of the proposed system for the early diagnosis of AD reaches 90.66%.

The concept proposed in [10] is based on a simple CNN architecture that can detect AD in 2D and 3D models from brain scans. VGG19 was also used in [10] to implement adaptive learning models. Therefore, the results from [10] are very important. The accuracy of 2D and 3D classification is 93.61% and 95.17%, respectively; the accuracy of the VGG19 model reaches 97%. The study mentioned in [11] made many data integrations based on MRI data

to understand AD. All CNN developers are trained on all devices. Then, the classification system with decision trees is used.

Random Forest, SVM, and nearest neighbor. The results discussed in [11] show that the integration of various modifications increases the accuracy of the prediction. The main limitation of the study presented in [11] is the limited data size. The authors of [12] discussed the potential of cognitive technology suitable for big data for AD diagnosis. However, it is recommended to provide appropriate models to improve the performance of AD prediction [12].

The framework created in [1] comprises a wearable electronic gadget that's equipped with sensors for supporting patients with advertising and making strides in their lifestyle. Besides, the electronic gadget empowers finding the persistent on the outline and reminding him/her for medicine times. It also has a button for asking for help in a crisis. The people who took part in the assessment have detailed that the outlined wearable gadget is simple to use. Additionally, the framework planned in [1] gives voice-based help for patients with advertisements by replying to their questions regarding solid nourishment. We specify that the greatest impediment to the work displayed in [1] is that the tests performed have not included people with AD. The framework planned in [1] has pointed to tracking imperative signs and the position of the individual with advertisement through a set of sensors and the Worldwide Situating Framework (GPS). The collected information is sent every five minutes to the caregiver through SMS for analysis of the well being status of the individual with AD. A curiously portable application has been proposed in [2] to provide patients with gentle and direct advertising. The application is based on facial acknowledgment and GPS tracking, for upgrading the every-day communication of patients with advertisements. Assist, the confront acknowledgment preparation is based on machine learning. It bolsters the quiet with advertisements to keep his or her family members in mind. Moreover, the portable application enables sending notices to remind the patients approximately of their day-to-day errands. The highlight of the work displayed in [2] is that it gives a framework for foreseeing advertisements and helping patients with advertisements. The forecast is performed employing a repetitive neural network (RNN) that explores movement's following information from the Daphnet dataset. At that point, a combination of CNN and timestamp window-based common dialect mastering plots is utilized for anomaly

following. More accurately, the created CNN points at identifying the feelings of individuals with advertisements. In advance, the proposed system provides assistance with respect to day-to-day activities, including dinner, showers, medication, and hydration activities. According to the overstated state-of-the-art with respect to the arrangements for advertising, a few comments got highlighted: The works displayed in and have focused on the detection of advertisements." In this viewpoint, the inquiry about papers that are based on profound learning and accurately that CNNs have illustrated outflanking comes about for identifying mellow and direct advertisements from MRI images.

The works displayed in and have focused on the help of the people with advertisements." More imperatively, compares advertisement-based frameworks. It is evident from Table 1 that the work displayed in has numerous highlights compared to the frameworks outlined in and . In any case, the creators of did not master arrangements for confront acknowledgment and voice help for an individual with advertisements. Another fundamental comment concerns the need for security in all related work, whereas IoT-based applications require security components for securing information. So far, the work displayed in is based on machine learning for confront location. Though the inquiry about profound learning has illustrated its efficiency compared to machine learning techniques,. Different from the over related works, our framework introduces CNN for confront acknowledgment. It permits supporting patients with advertisements for classifying the individual to whom he or she is talking. Moreover, our framework underpins voice communication through Google Collaboration and following through the GPS system. Thus, a notice is sent in case the individual with the advertisement clears out his or her security range. The security highlight has been coordinated with our arrangement by stowing away the personality and additional data into the images that are not stored within the database.

PROPOSED METHODOLOGY

According to the US National Library of Medicine ,normal human body temperature is between 97°F (36.1°C) and 99°F (37.2°C). Therefore, the camera can detect the temperature of the object with an accuracy of ± 0.2 °C. However, if the temperature is high than 99 °F (37.2 °C),our camera cannot detect In-fact,we want to create a model in the form of a collar that a person with AD would be happy to wear on facial recognition (RF). Therefore, we use

intelligent algorithms to classify the detected images into groups (family member non family members) based on the given information. Family members can access the library and add custom faces. We also provide tools to ensure AD patients's personal security and the confidentiality of their personal information against attacks. Therefore, define a system that tracks the current location of the Alzheimer's patient using smart notifications that pop up when leaving a certain area. Therefore, the proposed model provides psychological support and mobility support to Alzheimer's patients.

Additionally, the progression of AD varies from person to person. In particular our model can help patients with mild to moderate Alzheimer's. The goal of creating a collar powered by an IoT application is to help an Alzheimer's patient remember his family, identify many people with decrypted identities, and provide additional information hidden in images that are not stored in the database. Another requirement of our model relates to monitoring, security, and voice support. An overview of our solution Below, we show the different components of the system. That our model supports both face recognition and speech recognition. Facial recognition is based on CNN. However, if the given image is not available in the database, steganography can be used to hide the identity of that person and additional information about him. Additionally, our model allows people with AD to be monitored, and email alerts are sent. three pre-processed models, including the normalization level and median filter. The CNN generator then extracts points of interest in the eyes, nose, and mouth, which are used to classify the input image into family and non-family members.

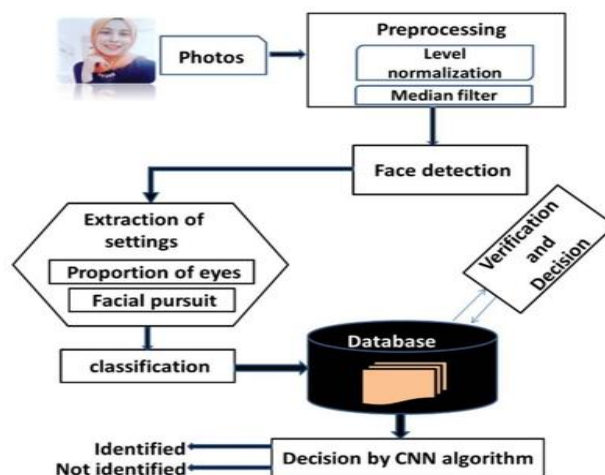

Figure-1

Components of Facial Recognition

- **Pre-processing**

The role of this step is to eliminate noise from optical or electronic devices during input to the captured image and access only the necessary data to prepare the image for the next step.

- **Deep Feature Extraction**

Extract information from the image and store it in memory for later use in the decision stage. The extraction of facial features is done by identifying points of interest in the mouth, nose and eyes. The effectiveness of these steps has a significant impact on the performance of the facial recognition system.

- **Special comparison (classification and decision)**

It involves modeling the parameters extracted from the face or face group according to the characteristics of the person. Many methods have been found in the literature; the simplest is to use distance calculation (similarity search).

Figure-2

- **Conclusion**

This is the step and verification that make the difference in identifying people. The recognition system involves finding a pattern that matches the input face. It is characterized by high acceptance. However, the verification system must determine whether the facial entry belongs to the claimant or the impersonator. More precisely, our ID model is used only for identification purposes. We have stated that the CNN architecture of our system consists of an input layer, different types of hidden layers, and an output layer. This set provides two different functions. The first part of the CNN used as a special object for the

image. The image is passed through filters, or convolution kernels, to create a new image called a convolution map. Some intermediate filters reduce image resolution through local maximum processing. Finally, the communication map is parallelized and assembled called CNN code. The first layer is responsible for convolution, and the other layers are responsible for local averaging, sub sampling, and resolution. The third layer follows the usual process. CNN is integrated into the camera network to implement the edge conversation concept. The latter increases efficiency and reduces latency.

This is the process of storing confidential information in digital files, image selected for this purpose is called the cover image, and the image obtained after steganography is called the steganographic image. To create Alzheimer's support in our solution, family members can hide personal information from the unknown, and only the beneficiary can decide to use the key.

Allow messages to be sent to Email if someone with AD cannot read them. A list of voice messages will appear in the AD patient's email application. You can also use notification services to notify users about in coming emails. Our app allows you to select a voice note and then write a voice message to inform the recipient about the unknown person.

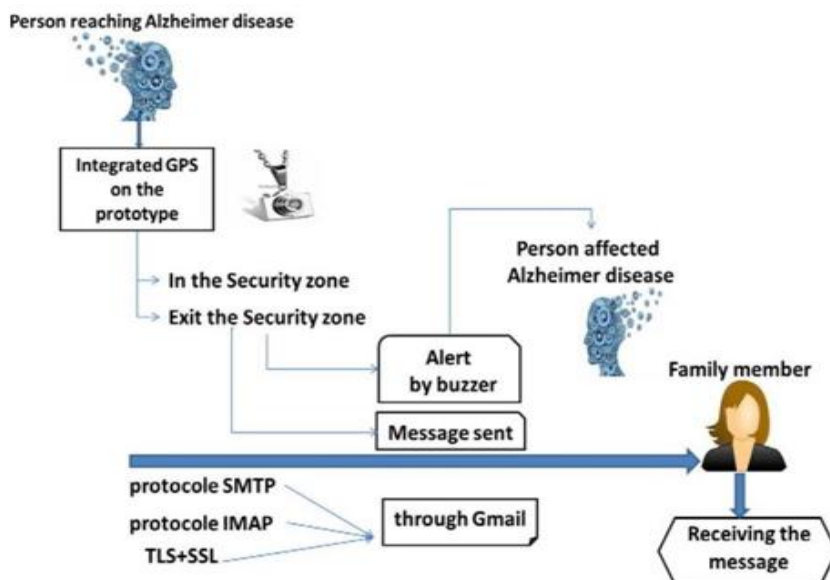

Figure-3

Supporting Communication

The idea is very simple: let people say a word to capture the sound to be recorded in the form of acoustic vectors. This series of acoustic vectors fully characterizes the evolution

of the spectral envelope of the recorded signal. The next step involves parsing the unknown signal into similar phrases, and Google Assistant will answer questions through a speaker in the suite. In fact, the same word can be said many times because people with Alzheimer's have difficulty remembering it.

It is worth noting that technology will help market his happen, and it has the ability to improve people's quality of life. Improves communication with family members and caregivers. it also helps people maintain relationships; and adults can easily communicate with simple sentences. It also gives people with limited mobility more freedom and reduces visual impairment.

Safety

Our system is designed to monitor the physical safety of adults with AD using their portable devices and hearing aids. Networks face many types of attacks that can interfere with sensors or data generated by the network For this purpose, we provide complete.

Procedures to ensure the personal safety of patients and the security of their personal information. Our care systems protect AD patients while maintaining their independence. We use GPS to accurately identify Alzheimer's patients. With a mobile service plan, updates the location every 2 minutes and prepares the location information on paper. Z ones can be created and a notification is sent via email if the patient leaves the area. The collar is designed to record the patient's daily activities. If you later leave the safe area, an email will be sent to family members notifying them of this information. The messages to Be sent are sensitive because they contain personal information. Therefore, it is very important to protect them. Email allows you to send confidential messages to protect sensitive information from unauthorized access. Our model provides high levels of integrity, authentication non repudiation using digital signatures in email by enabling the S/MIME protocol. It is widely accepted for sending digitally signed and encrypted documents and also help improve data privacy and security (using encryption).

WORKING PROCEDURE

Our model was tested with 16 volunteers. The type of development board used is the RaspberryPi3, which provides 4GB of RAM. It is the only computer that is powerful due to its small size. In particular, our board is considered a smart machine for RF transmission,

GPS, and Google Assistant. Additionally, our app is based on the hardware: The Xtrike mini microphone has excellent sound quality and records speech well without background noise. A bell is a low pitched sound that produces a loud sound. A headphone is a device that is placed in the ear and allows sound to be produced. It is used to listen to Google Assistant's responses. We use the NEO 6MV2 GPS module with a different microcontroller. When powered by 3.3 V DC, it receives signals from satellites. and continues to transmit data via Universal Asynchronous Receiver Transmitter (UART) communication The input for facial recognition on the Raspberry Pi3 is the image taken from the webcam. First, Open CV, an open source computer and machine learning software library, is executed to determine whether one or more faces are present in the image. If a face is found, we analyze its controls and decisions as just one part of the overall model, modifying it for recognition and matching it with images available in the library. We installed the Open CV Contrib version, which allowed us to build facial recognition and object detection. Our Python implementation is loosely based on the library and is suitable for machine learning and deep learning-based problem solving.

Benefits of facial recognition

The main idea of our system is based on re-searching CNN algorithms. Factors that affect recognition include physical changes, as a wide angle camera can provide good details of nearby objects. But closer objects have worse detail. In addition to light changes affecting the face recognition process, according to our test results, our design can achieve good identification. even if the person is wearing a mask. Factors that affect people's cognitive performance include changes in facial features such as the mouth and eyes, as well as shape and face. So the main result is the confusion matrix that allows us to understand whether there is a mis classification or not. . It is obvious that the success rate is very high and the success period is short.

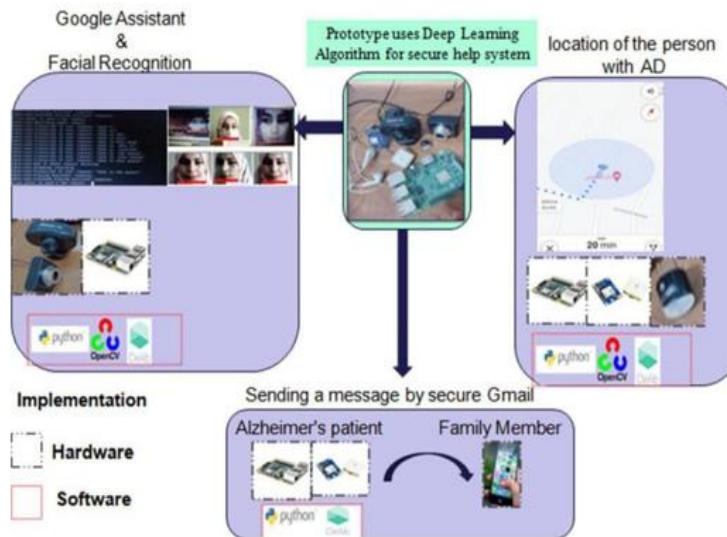

Figure-4

Figure-5

GOOGLEASSISTANT

Google will search, ask questions, and start conversations to reduce isolation and depression. Someone asks, "Do you love me?" Our model will do statistics to see that the problem is repeated many times, so it will be split by message. For more information on how to talk to the assistant, check out our permission model for accessing data from radar and other sources(weather, location, etc.). If the person has been where they were last week, If he doesn't remember or has a hard time with Google, it's okay because he can return to the question whenever he wants.

Figure-6

F.GPS

Emails sent to family members are protected using the same method that Email uses. Especially if the model user is outside the safe area, a warning message containing words and location will be sent every two minutes, and an audible warning will warn the model owner. If a person for gets where he was last week or becomes depressed, he can go back to history and revisit the places he visited. Additionally, family members can rely on the experience of a father or mother with Alzheimer's disease because the symptoms of the disease are similar to Alzheimer's disease.

ADVANTAGES

Instant monitoring: IoT devices can continuously monitor people's activities and health, providing updates to caregivers. This allows for early detection of any deviations in a person's daily life or health and rapid intervention if necessary.

Safety and Security: IoT devices such as smart locks, sensors, and cameras can improve personal safety and security. People with Alzheimer's disease. For example, smart locks can prevent movement by closing the door, while sensors can detect dangerous situations such as leaving the oven or falling.

Long Walk: GPS enabled wearables or tracking devices can help caregivers find people who can't walk or become lost due to Alzheimer's. **Medication Management:** IoT-based systems can assist with medication management by notifying people and their caregivers when it is time to take medication. Smart pill dispensers also reduce the risk of dispensing the wrong or incorrect medication by dispensing the correct dose at the scheduled time.

Tele-care and tele medicine: IoT devices support remote care and tele medicine, allowing caregivers to monitor patients without visiting them in person. This is especially helpful for care givers who can't be with someone or don't have other responsibilities.

Data Analysis and Analytics: IoT platforms can collect and analyze data regarding personal daily activities, sleep patterns, and vital signs. time. This information can give a better idea of the spread of the disease and allow caregivers and doctors to adjust care plans accordingly.

Care Planning: By analyzing data collected from IoT devices, caregivers and doctors can create personalized care plans tailored to a person's unique need sand preferences. This approach can be very effective in maintaining and improving a person's quality of life. Reduce burden on care givers. IoT based systems can perform specific tasks such as medication alerts and environmental monitoring, thus reducing the burden on care givers and allowing them to focus on emotional and social support for people.

CONCLUSION

Although there are many AD solutions the number of systems that support AD is still limited. Additionally, facial recognition and security features that help improve and change the lifestyles of AD patients still pose a challenge for current technology. This article describes the development of a simple technique to help Alzheimer's patients. Actually, we proposed a CNN based face recognition model. Additionally, steganographic encryption technology has been integrated to protect the identity of unregistered users in the database, thus supporting AD patients to identify multiple users on the network. Our model so far includes a GPS system that prevents the patient's location from being revealed. Therefore, if the patient leaves the predetermined area, an audible warning will be sent to family members. To help AD patients, the application process also includes mental health care through Google Assistant. As can be seen in the results section, our model achieves significant results in terms of accuracy and precision compared to the basic method. As a future work and based on our on going research, we propose the identification of people through a thermal camera that distinguishes one object from another. We are also considering 3D facial reconstruction to solve problems in person recognition and communication that will enable self reading in cases of a visual problem. Facial

reconstruction has many applications, and using scientific data to increase the efficiency and speed of the body is another direction that can be explored.

Abstract

Diabetes Mellitus (DM) is a disorder of the glucose-insulin regulatory system where the insulin producing beta-cells has been damaged. Insulin regulates glucose levels in the bloodstream and induces glucose storage in the liver, muscles, and adipose tissue, resulting in overall weight gain. Uncontrolled or poorly controlled diabetes leads to development of microvascular and macrovascular complications. The most effective treatment method for the diabetes is insulin injection. The glucose level is measured and insulin is injected depending on the measured glucose level. The laser transmitter is used to transmit the infrared light to the finger hose, in which the finger is placed. Then the signal is transmitted to the photodetector to convert the light signal into electrical signal. A signal conditioning unit is used to amplify the obtained electrical signal, from this the glucose level is measured. By monitoring the glucose level of the patient insulin will be injected automatically depending on the glucose level measurement. The insulin is injected automatically when the DC motor rotates and stimulates the driver relay which then tends to inject into the patient body. The dosage level may vary with respect to the severity of glucose level. So, this helps to deliver insulin to the patient at constant rate. Additionally, the temperature and heartrate of the patient are measured simultaneously and send information to the application by using Internet of Things.

Keywords

Diabetes mellitus, Glucose monitoring, Insulin injection, Laser technology, Non-invasive, Automatic injector

INTRODUCTION

Diabetes Mellitus occurs when someone has abnormal blood sugar. There are two major types of diabetes in Type 1 diabetic patients, diabetes occurs due to the autoimmune destruction of the insulin-producing beta cells in the pancreas whereas in Type 2 diabetics the diabetes mellitus occurs from insulin resistance and relative insulin deficiency. Diabetes can cause many serious secondary health issues such as blindness, stroke, kidney failure, Ulcers, Infections, obesity and blood vessels damage, among other health complications. [1]

It is a complex illness to require continuous medical care. Consistent education and support to patients in diabetes are to prevent acute complications and to reduce the risk of long-term complications. Untreated or poorly treated diabetes accounts for approximately 1.5 million deaths every year. Glycemic control is a key component of effective diabetes management, and the maintenance of near-normoglycemia is critical to minimize the risk of developing the microvascular and macrovascular complications that are generally associated with diabetes. Although many patients already know that tight glucose control is very important. However, they still fail to monitor their blood glucose level in actual clinical practice because of the frequent and painful fingerstick tests. [2]

The latest advances introduced to the field of BGM are non-invasive technologies to detect blood glucose concentration using secretions such as sweat, urine, saliva or tears. Besides these secreted fluids glucose concentration is also measured through the skin, earlobe and tongue tissue These mediums are analyzed to detect glucose concentration non-invasively by employing optical techniques such as Raman spectroscopy, polarity, diffuse reflection spectroscopy, absorption spectroscopy, thermal emission spectroscopy, photoacoustic spectroscopy and fluorescence spectroscopy. [1]

The accuracy of the proposed multisensory system will be evaluated by pairing and comparing noninvasive measurements with invasively measured readings. The main purpose behind designing a wearable device is to ensure continuous monitoring of blood glucose level. As the device is wearable one can easily monitor the fluctuations of blood

glucose levels at any instance. Besides, one of the drawbacks of conventional blood glucose measurement technique which is piercing fingers and thus causing tissue infection can be withdrawn using our proposed device.[3]

According to the International Diabetes Federation (IDF), in 2017 there were approximately 425 million adults suffering from diabetes. It can be said that a significant amount of invasive measures will be taken among a large number of people, where people with Type 1 diabetes, for example, could be asked to test their blood sugar four to eight times a day, thus making it gruesome for the patients. Therefore, a non-invasive blood glucose measuring device is needed. This paper presents such a device, named Glucotect, and describes in details the components used, their implementation and their functionality alongside a mobile application.[4]

About 537 million adults across the world have diabetes. Experts predict this number will rise to 643 million by 2030 and 783 million by 2045. As of 2021, an estimated 537 million people had diabetes worldwide accounting for 10.5% of the adult population, with type 2 making up about 90% of all cases. It is estimated that by 2045, approximately 783 million adults, or 1 in 8, will be living with diabetes, representing a 46% increase from the current figures.[1]

LITERATURE SURVEY

Diabetes is a chronic disease that causes critical health problems, and eventually leads to damage major organs. The main aim of this research is to design automatic insulin injection system with Continuous Glucose Monitoring (CGM) signals. This system controls the insulin dosage automatically according to the real-time glucose level, so that it can improve the quality of life for those who are suffering from diabetes. This system records the measurement time, glucose value from CGM, and flow rate per minutes for further use. The main purpose of this research is to design the continuous subcutaneous insulin infusion pump with real-time continuous glucose monitoring device called artificial pancreas. [2]

The CGM system is providing the real time glucose readings and the information about the glucose level. It monitors the glucose level at regular interval. The proposed system is for preventing the high blood sugar and wide glucose fluctuations. The main advantage of this system is instant reporting of blood glucose level whether the glucose level is falling or

rising. The system provides the accurate result. The patient's data is also updated in the cloud every day. The blood glucose sensor is the main component of this system. It is used to sense or monitor the glucose level of the human. The blood glucose sensor should be fixed properly, and it provides the correct readings. The readings are display in LCD and mobiles which will inject the amount of insulin to the human.[5]

Current blood glucose monitoring (BGM) techniques are invasive as they require a finger prick blood sample, a repetitively painful process that creates the risk of infection. BGM is essential to avoid complications arising due to abnormal blood glucose levels in diabetic patients. Laser light-based sensors have demonstrated a superior potential for BGM. Existing near-infrared (NIR)-based BGM techniques have shortcomings, such as the absorption of light in human tissue, higher signal-to-noise ratio, and lower accuracy, and these disadvantages have prevented NIR techniques from being employed for commercial BGM applications. A simple, compact, and cost-effective non-invasive device using visible red laser light of wavelength 650 nm for BGM (RL-BGM) is implemented in this paper. The RL-BGM monitoring device has three major technical advantages over NIR. Unlike NIR, red laser light has ~30 times better transmittance through human tissue. Furthermore, when compared with NIR, the refractive index of laser light is more sensitive to the variations in glucose level concentration resulting in faster response times ~7-10 s.[1]

The main objective is to introduce a method of blood glucose level measurement that is non-invasive and can overcome the former limitations with better accuracy in a very cost-effective way. Blood glucose concentration can be measured using the PPG (Photoplethysmogram) signal. But to gain higher accuracy we need to consider the physiological variations which lead to erroneous measurement of glucose levels. Using GSR (Galvanic Skin Response) sensor data, these perturbations can be minimized. So, in our model PPG sensor and GSR sensor have been used to accurately measure blood glucose levels.[3]

A portable glucose monitoring system with remote data access based on a novel e-oscilloscope was developed using a glucose biofuel cell and a capacitor circuit interfaced to an ESP8266 microcontroller programmed to convert the charge/discharge rates of the capacitor functioning as a transducer. The capacitor charge/discharge rates were converted into glucose concentration readings that is monitored remotely. A linear dynamic range of 1

mM – 25 mM was achieved. The output frequency was calculated using the capacitor charge/discharge rates. The glucose monitoring system comprise a glucose biofuel cell, a charge pump circuit, a capacitor and an ESP microcontroller.[6]

METHODOLOGY

The system is used to measure the blood glucose level of the patient non-invasively and then inject the insulin to the patient automatically based on the glucose level of the patient. Infrared laser light is used across the finger hose to measure glucose. The laser transmitter is used to pass the red light to the finger hose. Laser transmitter transmits the 750nm wavelength of red laser light. Finger hose is used to place the finger of the patient. Some amount of light is absorbed by the patient's finger. Then the light will be passed to the photodetector. Photodetectors are optoelectronic devices that detect incident light or optical power and convert it into an electrical signal.

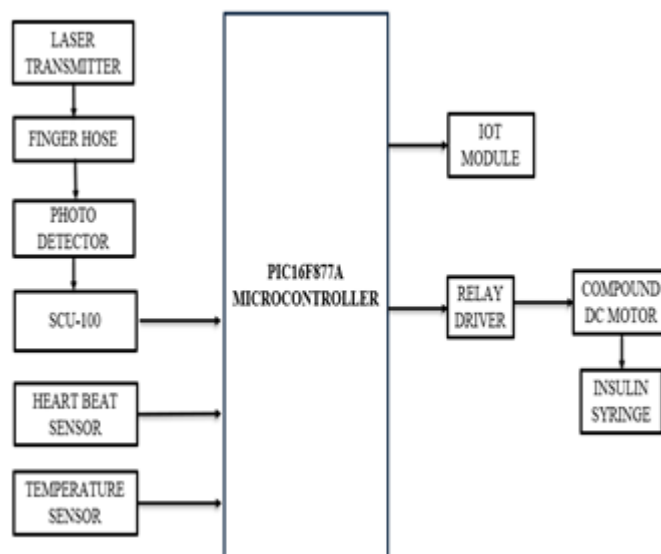

Fig.1. Proposed System

The light dependent resistor is used as a photodetector. A Light Dependent Resistor (LDR) is a type of optoelectronic sensor that detects light levels. LDRs are also known as photoresistors. The resistance of an LDR decreases as the amount of ambient light intensity increases. Photodetector is used to convert absorbed light signal into electrical signal. As this conversion helps in measuring the blood glucose level of the diabetes patient. Signal conditioning Unit is used to amplify the electrical signal. A PIC microcontroller (Peripheral

Interface Controller) could serve as the brain of the device. It can collect the data from the sensor and the value of glucose. Then it can send signal to the motor based upon the glucose level of the patient. The use of a DC motor in these devices offers precise control over the injection process, allowing for accurate and reliable delivery of insulin. The DC motor may also be responsible for controlling the movement of the injection needle. This ensures that the needle is inserted at the correct angle and depth to facilitate the proper subcutaneous delivery of insulin. The relay is used to control the injector to move forward direction and reverse direction. The driver relay, when activated, then energizes the injector mechanism.

A heartbeat sensor, also known as a heart rate monitor, is used to measure a person's heart rate in beats per minute (BPM). Temperature sensors are designed to measure the ambient temperature in the surrounding environment or the body. An IoT (Internet of Things) module for a laser-based non-invasive glucometer monitoring system could enhance its functionality. This module could facilitate wireless communication between the device and a centralized system, enabling remote monitoring and data analysis. It might also allow users to access real-time glucose readings through a dedicated app on their smartphones.

The methodology outlines the step-by-step process for designing, implementing, and testing the proposed non-invasive blood glucose monitoring system with integrated health monitoring and insulin pump control. The process flow or methodology of laser based non invasive glucometer with automatic insulin injector as follows

Select PIC16F877A microcontroller for system control. Position a laser light source and a light detector on either side of the finger hose. Choose the finger hose due to its absence of bone tissues and small thickness. Employ laser transmission through the finger hose. Measure the amount of light passing through the finger hose. Correlate the light transmission with blood glucose levels. Integrate a heartbeat sensor to monitor the patient's heart rate. Utilize a temperature sensor to monitor the patient's body temperature. Incorporate an insulin pump for precise insulin delivery. Allow users to program a tailored insulin delivery pattern based on glucose levels. Implement an automatic halt of insulin infusion when glucose levels reach a predetermined threshold. Ensure the system halts insulin infusion when predetermined glucose levels are reached, and the user is

unresponsive. Provide increased protection against severe low blood glucose, especially during sleep.

Utilize the PIC16F877A microcontroller to gather data from the glucose, heartbeat, and temperature sensors. Establish an IoT connection, transmitting the sensor data to the Blynk application for monitoring. Develop an interface on the Blynk application to display real-time sensor data. Enable users to monitor glucose levels, heart rate, and body temperature remotely. Implement alerts and notifications for critical conditions. Conduct rigorous testing of the entire system, ensuring accuracy and reliability in glucose measurement and sensor data transmission. Verify the responsiveness of the insulin pump control system and safety measures. Develop user-friendly documentation for system setup and usage. Provide training materials for users on interpreting sensor data and responding to alerts. Collect feedback from users to identify any issues or areas for improvement. Iterate on the system design and software based on user feedback to enhance overall performance and user experience.

System Design

Fig.2. System Architecture

HARDWARE REQUIREMENTS

The required hardware components are as

- PIC 16F877A Microcontroller
- Laser Transmitter
- Light Dependent Resistance
- Compound DC Motor
- Relay driver
- IOT Module
- SCU-100
- Heart Rate Sensor
- Temperature (LM35) Sensor

Laser Transmitter

The laser transmitter is used to pass the red light to the finger hose. Laser transmitter transmits the 750nm wavelength of red laser light.

Finger Hose

Finger hose is used to place the finger of the patient. Some amount of light is absorbed by the patient's finger. Then the light will be passed to the photodetector.

Photodetector

Photodetectors are optoelectronic devices that detect incident light or optical power and convert it into an electrical signal. It is used to convert the absorbed light signal into electrical signal. As this conversion helps in measuring the blood glucose level of the diabetes patient.

Temperature sensor

Temperature sensors are used to measure the ambient temperature in the body. It is an input to the microcontroller.

Heart Rate Sensor

It is used to measure a person's heart rate in beats per minute (BPM). It is an input to the microcontroller.

PIC 16F877A Microcontroller

A PIC refers to the Peripheral Interface Controller. A PIC microcontroller could serve as the brain of the device. The PIC microcontroller could manage tasks such as interfacing with

the laser sensors, processing glucose data, controlling the automatic insulin injector, and handling communication with the IoT module.

DC Motor

A DC motor is commonly used in automatic insulin injectors to control the injection process. The DC motor may also be responsible for controlling the movement of the injection needle. It is the output of the microcontroller

Relay Driver

The relay is used to control the injector to move forward direction and reverse direction. The driver relay, when activated, then energizes the injector mechanism. This could include the motor to precisely delivers the required amount of insulin.

IoT Module

IoT module facilitate wireless communication between the device and a microcontroller, enabling remote monitoring and data analysis. It allows users to access real-time glucose readings through a dedicated app on their smartphones. It is an output of the microcontroller.

HARDWARE IMPLEMENTATION

The Hardware Implementation is an important module in constructing a project. The project can be done based on the input and output of the microcontroller. The input of the microcontroller are as as photodetector output, temperature sensor and the heart rate sensor. The output of the microcontroller is connected to the DC Motor and the collected data transmitted to the IoT Module.

The laser transmitter can be used to transmit the red light. The power supply for laser module is 5V which given from the PIC microcontroller. The photodetector consists of two pins as voltage supply pin and ground pin in which voltage pin is connected with the 5V power supply and the ground pin is connected with the ground pin and it also connected to the RA1 of PIC16F877A Microcontroller.

The light detector can be used to convert the light signal to electrical signal. Then these signals can be transmitted to the LM358 amplifier. The LM358 can handle a DC supply voltage from 3V to 32V, and it can source up to 20 mA per channel. Then the LM358 pin can be connected to the RA₃ analog pin of the PIC16F877A Microcontroller.

The temperature (LM35) sensor consists of three pins such as power supply (Vcc pin), ground pin, and the output pin. The output pin of the sensor is connected to the RA0. The ground pin is connected to the ground pin of the microcontroller. Then the power supply is connected to the Vcc pin of the microcontroller.

The Heart Rate sensor is used to measure the heart rate of the patient. The heart rate sensor consists of the three pins as power supply (Vcc pin), ground pin and the output pin. The output pin of the sensor is connected to the RA0. The ground pin is connected to the ground pin of the microcontroller. Then the power supply is connected to the Vcc pin of the microcontroller.

The relay driver consists of 5pins and three pins as normally open, common and normally close. The normally close pin is connected with the motor to control the motor process. The other pins of motor is connected with the D3 and D8 of the IoT Module to control the insulin injection.

The Iot module can receive the data from the microcontroller. The microcontroller can send the data through the RC6 pin which is the transmitter pin of the microcontroller. The data can be collected by the receiver pin (RX pin) of the IoT Module. The IoT module can be used to display the data.it can also used to select the dosage level of the insulin given to the patient. Then insulin will be injected to the patient automatically using the DC motor mechanism.

The output of the microcontroller is received in the pin RC3 and it makes the relay to switch on the circuit. It may leads to rotate the motor in the forward direction. Then insulin injected to the patient based on the dose level given by the IoT Module. After the insulin injection the relay will be turned off. It may leads to rotate the motor in the reverse direction. Then insulin syringe will be ejected from the patient.

Fig 3. Hardware Implementation

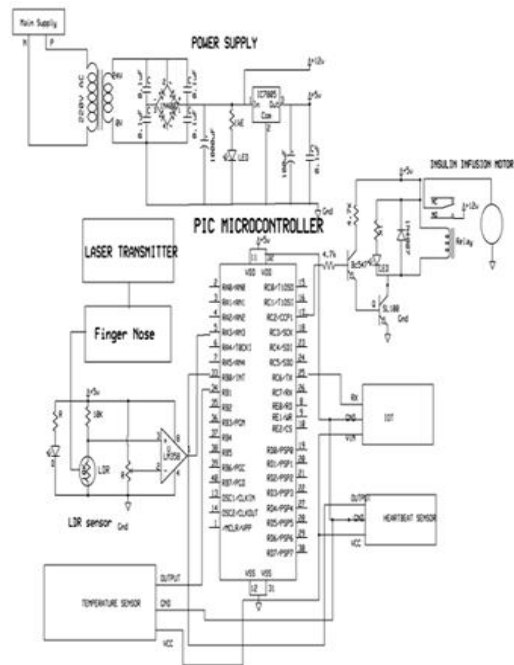

Fig.4. Pin diagram

SOFTWARE REQUIREMENTS

The required software are as

- MP Lab
- Arduino IDE
- Blynk App

MP LAB

The MP Lab software in a laser-based glucose monitoring system with an automatic insulin injector would likely serve several key functions:

Data Acquisition and Analysis:

The software would collect data from the laser-based glucose monitoring system, including glucose levels measured by the laser and potentially other relevant metrics such as blood pressure or heart rate. It would then analyze this data to provide insights into the user's health status.

User Interface:

The software would feature a user-friendly interface through which users can interact with the system. This interface may display glucose levels in real-time, historical trends, and personalized recommendations or alerts.

Insulin Dosing Algorithm:

The software would incorporate algorithms to calculate insulin dosages based on the user's glucose levels and other relevant factors such as meal intake, exercise, and time of day. The automatic insulin injector would then administer the calculated dosage accordingly.

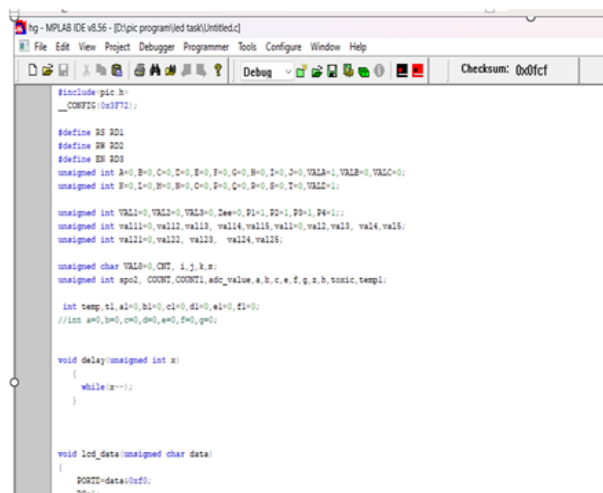

Fig.5. MP Lab Software

ARDUINO IDE

The Arduino IDE (Integrated Development Environment) is a software application used for programming Arduino microcontroller boards. It provides a convenient interface for writing, compiling, and uploading code to Arduino boards. The IDE supports the Arduino

programming language, which is based on Wiring, and it comes with a set of standard libraries to facilitate coding. Key features of the Arduino IDE include:

Code Editor: The IDE provides a text editor with features like syntax highlighting, auto-indentation, and code completion to aid in writing Arduino sketches (programs).

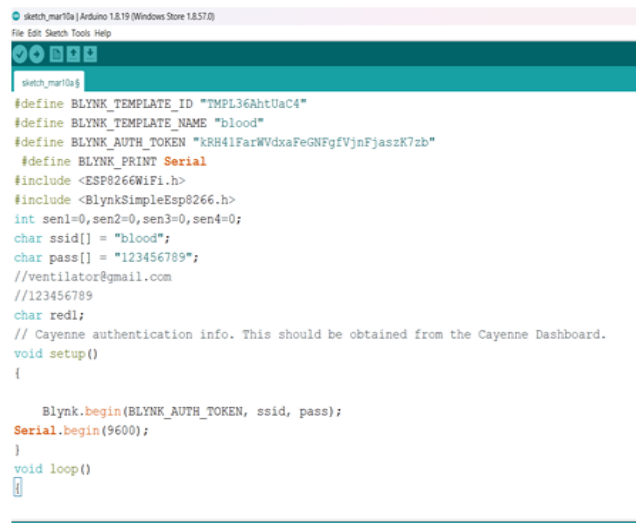

Sketches: Arduino programs are called sketches, and the IDE organizes them into a structure consisting of `setup()` and `loop()` functions. The `setup()` function runs once at the beginning of the program, while the `loop()` function runs repeatedly.

Compilation: The IDE compiles sketches into machine code that can be executed by the Arduino board. It checks for syntax errors and provides feedback to the user.

Upload: Once compiled, the IDE uploads the compiled code to the Arduino board via a USB connection, enabling the program to run on the hardware.

Libraries: Arduino IDE comes with a set of standard libraries for various functions such as controlling digital and analog pins, working with sensors, and communicating over different protocols like SPI, I2C, and UART. Additionally, users can install third-party libraries to extend the functionality of their projects.

Platform Support: The Arduino IDE supports multiple operating systems including Windows, macOS, and Linux.

BLYNK APPLICATION

Blynk is an IoT platform for iOS or Android smartphones that is used to control Arduino, Raspberry Pi and NodeMCU via the Internet. This application is used to create a graphical

interface or human machine interface (HMI) by compiling and providing the appropriate address on the available widgets.

Blynk was designed for the Internet of Things. It can control hardware remotely, it can display sensor data, it can store data, visualize it and do many other cool things.

There are three major components in the platform:

Blynk App: – It allows you to create amazing interfaces for your projects using various widgets which are provided.

Blynk Server: – It is responsible for all the communications between the smartphone and hardware.

Blynk Libraries: – It enables communication, for all the popular hardware platforms, with the server and process all the incoming and outgoing commands.

In this project the bynk app can display the data to the monitoring person. It can display the data such as temperature, heart rate, and the glucose level of the patient. It can also select the insulin level to be injected to the patient.

Fig.7. Blynk Application

CONNECTIVITY AND INTEGRATION

The software may offer connectivity options to sync data with other devices or platforms, such as smartphones, fitness trackers, or electronic health records systems. This integration

could provide a more comprehensive view of the user's health and enable healthcare professionals to monitor and adjust treatment plans as needed.

Glucose molecules have the ability to vary the refractive angle of light to an extent proportional to its concentration, and the overall refractive index of a given media. Refraction based estimation is based on the principle of Snell's law and the magnitude of each parameter is related to the concentration of glucose in the aqueous solution. According to Snell's law, the refractive angle is inversely proportional to the concentration of glucose in aqueous sample. The light ray (ab) tends to incline towards the normal ac and decreases the refractive angle (θ_2) as the glucose concentration increases hence more photons strike the photo-transistor.

The relation between output voltage and light intensity (X) is expressed in (1). Simplification of equation (1) results in a direct relation between the intensity of light and output voltage as shown in (2). Each photon carries of energy as expressed in (3), higher number of photons striking the photo-transistor's surface in return generates the higher output voltage (Voc). The refractive index (n_2) for various glucose concentration is measured by joining points a, b and c. The glucose concentration rise in aqueous solution reduces the refractive angle (θ_2) and the line ab reaches to a new position. Refractive index (n_2) is calculated using a mathematical form of the Snell's law using (4). The refractive angle (θ_2) decreases for higher glucose concentrations which consequently increases the refractive index (n_2) according to (4) and the output voltage rises as more number of photons strike the phototransistor. Reduction in θ_2 also decreases the radius (bc) of the laser circular spot (LCS) as light rays bend towards the normal (ac) shown in at higher glucose concentrations according to Snell's law.

$$Voc' = nkT / q \ln(X I_{sc} / I_o) = nkT / q [\ln(I_{sc} / I_o) + \ln X]$$

$$Voc' = (Voc) + nkT / q \ln X$$

Where, I_o = Reverse saturation current

I_{sc} = Short circuit current

Voc = Initial voltage

nkT/q = Constant at a temperature (T) while, $q=1.602 \times 10^{-19}$ and $k = 1.380 \times 10^{-23}$. All the parameters except intensity of light (X) are constant.

Therefore,

$$V_{oc}' \propto \ln X$$

The amount of energy that each photon carries is

$$E = hc/\lambda$$

While the variables in (3) have the values,

$$h = 6.6260 \times 10^{-34} \text{ m}^2 \text{ kg} / \text{ s},$$

$$C = 2.9 \times 10^8 \text{ m} / \text{ s}$$

$$\lambda = 650 \text{ nm}.$$

It shows that the energy possessed by the photon is dependent on the wavelength hence photons of NIR light (700-1400 nm) carry lesser energy than red light (650 nm). This mathematical analysis potentially suggests that red light is suitable for biomedical applications as the absorbance of red light will be lesser than NIR due to its higher energy. Snell's law is represented mathematically by equation

$$n_2 = n_1 (\sin \theta_1) / \sin \theta_2$$

Where, $n_1 = 1.333$ representing the refractive index of water, n_2 is the refractive index of aqueous glucose solution which is to be determined, θ_1 represents the refractive angle of water and θ_2 shows the refractive angle of the glucose solution. The refractive angles θ_1 , θ_2 are calculated.

$$\theta_1 = \tan^{-1} (bc / ac)$$

$$\theta_2 = \tan^{-1} (b'c / ac)$$

Wavelengths of laser light from 500 nm to 1200 nm are generated using LEDS of 1.5 watt power (P_o) and the generated laser light is passed through the human finger. The transmitted light through the human finger is measured using as a ratio between the output power (P) at the phototransistor and the power (P_o) when laser light directly falls on the phototransistor, when there is no human finger inserted in the RL-BGM. The transmittance is converted into OD by using and the absorbance can be estimated by employing. OD measures the throughput of the human finger whereas OD is directly related to the transmittance.

$$\text{Transmittance (T)} = P / P_o$$

Where, P is the radiant power of the rays leaving human finger and P_o is the radiant power for monochromatic laser light.

$$\text{Absorbance (A)} = -\log(\%T/100)$$

CONCLUSION

In this paper, the glucose level of the patient is measured by non-invasive method. It can be measured by passing the infrared light. Based on the glucose level of the patient the insulin will be injected to the patient automatically. This helps the diabetes patient to have a proper and healthy lifestyle. It has few limitations as it is larger in size. In future the size can be reduced to a compact form by using 3D printing technique which provides a betterment of life to the Diabetic patients.

ABSTRACT

Leg swelling or edema during pregnancy is a common and uncomfortable condition. But, it can also be caused by serious complications like preeclampsia and deep vein thrombosis, which can be life-threatening. It is not just limited to pregnant women; people who stand for prolonged periods without rest are also at risk of developing this condition. However, there are effective treatments available that include massage, wearing compression socks, and exercise. We have developed a smart wearable massaging system that can automatically detect swelling and vibrate to improve blood flow in the affected area. Furthermore, we can manually control the vibrator to cater to the specific needs of the user. With this device, we can help people suffering from edema overcome the discomfort and pain associated with it.

Keywords

Smart fabrication, Wearable device, pregnant women, Deep vein thrombosis, Leg Edema.

Introduction

Edema is one of the most prevalent troubles during pregnancy as a result of increased hydrostatic pressure. Additionally, this may have a role in the formation of lower extremity varicose veins [2]. One of the most common pregnancy issues is edema.

Approximately 70% of pregnant women experience clinical edema at some point throughout their pregnancy. One of the most common causes of lower extremities edema is an increase in hydrostatic pressure during pregnancy. Pregnancy causes a normal physiological alteration in which total body water levels rise by 6 to 8 liters. This fluid is composed of two-thirds extracellular and one-third interstitial storage. [5]

Furthermore, pregnancy increases the chance of developing venous insufficiency and varicosity in the lower extremities and iliac vessels. Varicose veins form as a result of weak

blood vessel walls and ineffective valves. While gravity makes lower extremity vessels the most vulnerable, vulvar, rectal, and internal iliac vessels might be affected by pregnancy-related hemodynamic alterations [2]. As the pregnancy proceeds, fluid might build in tissues, most commonly in the feet, ankles, and legs, causing them to swell and seem puffy. This condition is known as edema. Occasionally, the face and hands enlarge. Some fluid accumulation during pregnancy is typical, particularly during the 3rd trimester. It's called physiologic edema. Fluid accumulated during pregnancy due to the adrenal glands releases more of the hormones that drive the body to retain fluids (aldosterone and cortisol). Fluid also accumulates because the expanding uterus disrupts blood circulation from the legs to the heart. As a result, fluid accumulates in the veins of the legs and seeps into the surrounding tissues. [5]

Thrombosis has historically been more common in the third trimester, during labor and delivery, and in the postpartum phase. Compression therapy, which includes compressive bandaging and the use of compression garments, is the fundamental and indisputable approach used in the prevention and treatment of venous-lymphatic system dysfunction and the related consequences. [2] Not only the pregnancy people, the people who have musculoskeletal disease, poor ergonomics in the workplace, and prolonged standing and seated periods are also vulnerable for the Deep vein thrombosis(DVT)[5][8][11][12]. Leg elevation and wearing medical compression stockings were not helpful for the pregnancy people [4]. Compression stockings, also known as 'flight socks', have recently gained attention for their potential to minimize the risk of deep vein thrombosis (DVT) and other circulatory issues in airline travelers. The stockings worn during the trip are identical to those used to help patients recover from surgery. Compression stockings promote blood flow by applying mild pressure, particularly to the ankle. Leg movement and pressure promote blood flow from superficial veins to deep veins and return to the heart. This reduces the risk of blood clots in deep veins, which can be lethal if they reach the lungs. [12]

A wearable device is a small, portable gadget that can be attached to an individual's clothing or accessories or worn directly on the body. The goal is to identify how the human body behaves. In addition to being a type of hardware, wearable may perform strong tasks with the help of software assistance, data interaction, and cloud interaction. The issue of wearable device sizing and portability is resolved when fundamental components like

sensors can be replaced by smaller, lighter modules. Compression can be performed alone or in association with other techniques including intermittent pump compression (IPC), manual lymph drainage, or breathing and physical exercises. Even so, up to 80% of pregnant women are concerned about lower limb edema and its concomitant problems, which include discomfort, the sense of heavy limbs, paresthesia, burning sensation, and nocturnal cramps. [4] Clots in deep veins, which can be lethal if they reach the lungs. [12]

Methodology

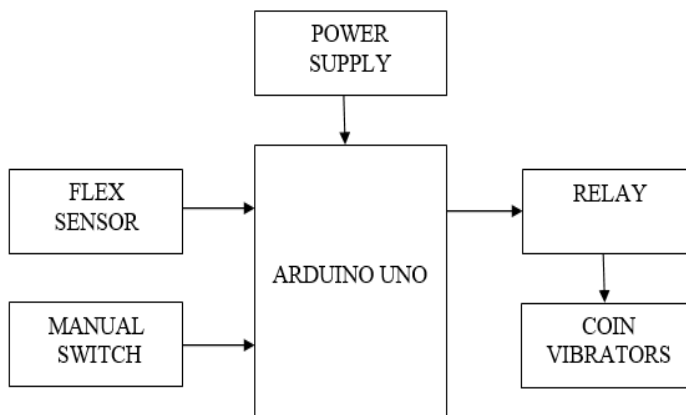

Fig: 1 Schematic Block Diagram

Flex Sensor:

The flex sensor placement is shown in the Fig: 1. A flex sensor detects bending or flexing. It is often made out of a flexible substrate, such as a plastic film or rubber, on which conductive elements (such as conductive ink or metal traces) are printed or deposited. They are typically tiny and flexible, making them conveniently integrated into a variety of equipment or affixed to surfaces that must be monitored for bending. The working principle of Flex sensors is based on resistance change. As the sensor bends, the distance between the conductive lines varies, affecting the sensor resistance. This change in resistance can be measured and connected to the degree of bend. They come in a variety of sizes and forms to accommodate different applications. It can be interfaced with microcontrollers like Arduino, Raspberry Pi, and other embedded devices. Resistance changes are often measured with analog-to-digital converters (ADCs) or other signal processing circuits. Here we used a 4.5 inch flex sensors to measure the changes in the ankle diameter of the user.

Manual Switch:

Here we also attached a manual switch, for the control of this device based on the users requirement instead of the signals from flex sensors. It is designed to directly shut on and shut off the device.

Relay:

A relay is an electromechanical switch powered by an electromagnet. It is made up of a coil (the electromagnet) and one or more contact sets (switches). When current travels through the coil, it creates a magnetic field that attracts or repels an armature, mechanically closing or opening the contacts. Relays are widely used to regulate high-power or high-voltage circuits using low-power signals, making them a crucial component in many electronic and electrical systems. We used a small and easy to use 1 channel relay board that operates on 12V. Use it to control one 240V power appliance directly from Arduino, Raspberry Pi, and other microcontrollers or low voltage circuits.

Vibrators:

Vibrators are devices that generate mechanical vibrations using electromagnetic or piezoelectric principles. These vibrations may be utilized for a variety of reasons, including haptic feedback in mobile phones, pagers, warning systems, and vibration sensors. Here we used 6 coin vibrators which are all mounted in different locations around the entire cuff and it similar to the figure shown in Fig: 2. So because of that the user can feel the vibrations at different locations at the same time. Coin vibration motors have a relatively high start voltage (compared to cylinder pager vibration motor) which must be considered in designs. Typically this is around 2.3v (all coin vibration motors have a nominal voltage of 3v) Outer diameter: 10 MM; Thickness: 3 MM Rated voltage: 1V To 6V, Current: 66 MA Output Speed: 12000 RPM Cable Length: 2cm/ 0.79in

Fig: 2 Coin Vibrators

Arduino Uno

The Arduino Uno is a well-liked microcontroller board built around the ATmega328P processor. It is a member of the Arduino family of boards, which are extensively used for developing interactive electronic projects. Arduino Uno can be programmed via the Arduino Integrated Development Environment (IDE), which is built on the C/C++ programming language. It is suitable for beginners and offers a big online community of users and resources. Arduino Uno, like other Arduino boards, is open-source hardware, which means that the design files are free for anyone to use, alter, and share. It is compatible with a large selection of shields (add-on boards) and modules, making it suitable for a variety of projects. The Arduino Uno is less priced than other microcontroller development boards, making it accessible to amateurs, students, and professionals alike.

The Uno is powered by the ATmega328P microprocessor, which runs at 16 MHz. It contains 14 digital input/output pins (including 6 PWM outputs) for interacting with external circuits and devices. There are six analog input pins, which allow you to read analog signals from sensors and other devices. The Uno can be linked to a computer via USB for programming and serial communication. This is accomplished through the employment of a USB-to-serial converter chip. The board can be powered via either the USB connection or an external power supply (7-12V DC).

Results and discussion

The circuit diagram for the prototype is shown in the Fig: 3. And the simulated and the function of coin vibrators are shown in the Fig: 4.

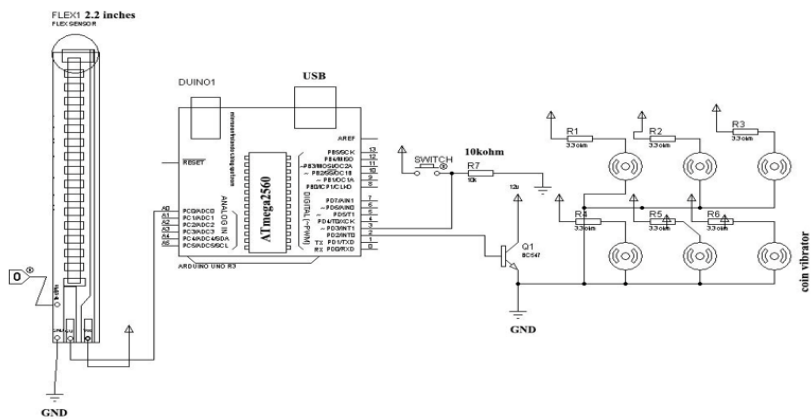

Fig: 3 Circuit Diagram

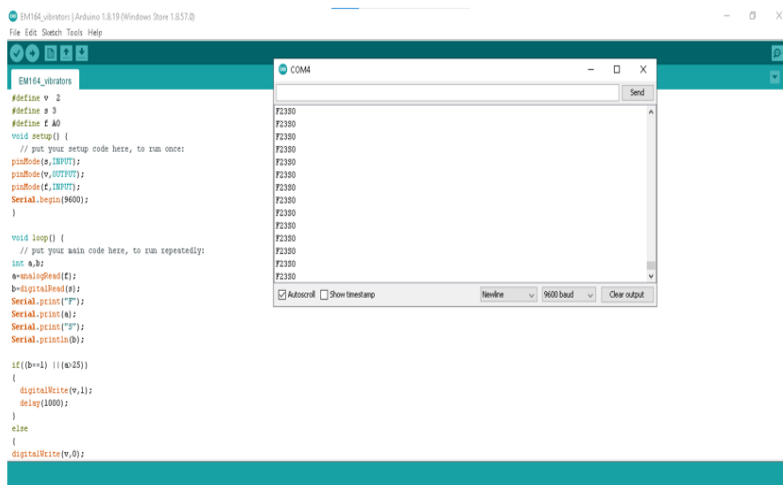

Fig: 4 Simulation output

Fig: 5 Hardware prototype before fabrication

Fig: 6 Hardware prototype after fabrication

Fig: 7 Real time demonstration of Prototype

The representation of the Hardware prototype before fabrication is shown in Fig: 5 and Fig: 6 show the Hardware prototype after fabrication. The Prototype is fixed and a real time demo is done as shown in Fig: 7. Leg fluid accumulation is a severe medical issue, and prevention can significantly minimize the chances of linked diseases and disorders. Understanding the way fluid collects in the legs during pregnancy, musculoskeletal disease, poor ergonomics in the workplace, and prolonged standing and seated periods can allow for the development of medicines and therapeutic techniques aimed at reducing leg fluid accumulation while the above said activities and the associated health hazards. It is generally

known that fluid accumulation in the legs raises capillary pressure, forcing blood plasma to flow out of the vasculature and into the interstitial spaces [8].

Conclusion

Edema is a prevalent medical evaluation in a variety of illnesses involving the cardiovascular, renal, and hepatic systems, in addition to in inflammatory and metabolic diseases, nutritional deficiency pregnancy, and as a post-surgical risk. Edema is frequently an early indicator of massive fluid retention, which can later lead to substantial cardiac overload and conditions such as coronary heart failure. We created a prototype for a smart-cuff that can continuously monitor ankle diameter changes in edema patients and vibrate to alleviate pain.

We will use the proposed prototype to treat people who experience soreness in their lower leg muscles, as well as minor leg edema and swelling caused by pregnancy, musculoskeletal disease, poor ergonomics in the workplace, and prolonged standing and seating [5][8][11][12]. The proposed smart cuff allows users to continuously lower edema levels in patients with no guide intervention. The experimental effects detect the circumferential alternate in an optimal manner, and the vibrator on this prototype is capable of practically fully relieving pain by increasing blood flow in that specific region.

Future Work

Recent advancements in IoT and Wi-Fi technology, the development of sensitive sensors, as well as the emergence of cutting-edge systems based on algorithms, can made it realistic to construct a state-of-the-art device for remotely monitoring and reducing the edema.

However, in the perspective of hardware structure and algorithms, there may be a few challenging scenarios that must be carefully addressed. The planned prototype is in its early phases. Developing a completely wearable smart wearable massage and monitoring system using e-textile technologies could be considered future work.

Abstract

Breast cancer was most frequent cancer in 157 out of 185 countries in 2022, accounting for 6,70,000 deaths worldwide, half of which were in women without particular risk factors. Breast, rectum, colon, lung, and prostate are the most prevalent malignancies. To avoid death, early detection and classification are needed for treatment. The gold standard for cancer diagnosis is histopathological image analysis. In this work, deep learning is used for automatic detection and classification of cancer from histopathological images. The Convolution Neural Network (CNN) VGG-16 model was used to test and train on a dataset of histopathological images, including both cancerous and non cancerous images. Here, the two stages of cancer were identified. The first one is binary classification, and the second one is multiclass breast cancer identification. In binary classification, the VGG16 model was used. In multiclass classification, eight types of breast cancer are identified using the same model. Among the several deep learning methods, transfer learning reduces the amount of training data required while increasing output accuracy. By adjusting the weight and tuning hyperparameters, the pre-trained model can be used for this classification. This work includes Binary classification with 85% accuracy, 74% precision, 64% recall, and 69% F1score. And in Multiclass breast cancer with 90% accuracy, 92.5% precision, 97.1% recall, 94.8% F1 score.

Keywords

Histopathological image, deep learning, artificial intelligence, cancer detection, breast cancer, cancer classification.

INTRODUCTION

Cancer ranks among the most prevalent diseases in global today. This disease of cancer occurs when the uncontrollable growth of body cells occurs. Breast cancer, Colorectal cancer, Prostate cancer, and Lung cancer are most common kinds of cancer.

Cancer can have many different causes, but genetic abnormalities that cause aberrant cell behavior are frequently one of them. Age, heredity, specific activities (like smoking and eating poorly), exposure to environmental variables (such radiation and certain chemicals), and certain viruses are some risk factors for developing cancer .A mass of diseased tissue is called a tumor.

Breast tumor can be classified as either cancerous (malignant) or non cancerous (benign). The fundamental cells that make up the breast and other body parts' tissue are where cancer begins. Sometimes the process of cell division is flawed, resulting in the formation of new cells or the death of damaged or old cells earlier than the body needs them[14].

Multiple symptoms may be present, depending on the disease's type and stage. These symptoms can include prolonged coughing, soreness, changes in the skin, exhaustion, and unexplained weight loss. STAGE 0 indicates the lack of cancer and the existence of abnormal cells with the potential to become cancer. STAGE II indicates a localized, small-scale malignancy . When a cancer is in STAGE II or III, it has progressed and spread to nearby tissues or lymph nodes. STAGE IV cancers have metastasized to other body areas.

Radiation therapy, Chemotherapy, Surgery, Immunotherapy, Hormone therapy are the choices for treating cancer.

Fig.1. Input Images

Compare to the techniques for diagnosing breast cancer, like MRI, mammogram, and CT scan. The most reliable method for diagnosing cancer is histopathology. By utilizing the BreakHis dataset for model training, tested models of images were split into either benign or malignant [12]. Breast cancer diagnosis challenges pathologists due to visual interpretation limitations. We proposed a CNN model that classifies breast cancer from histopathological images effectively [15]. Accurate diagnosis is improved by better segmentation and classification algorithms. CNN contributes to lower mortality and early disease detection [11]. For detecting breast cancer, deep learning overcomes the limitations of machine learning. In CNN network, particularly a deep learning technique, works well for classifying images of breast cancer[13]. Deep learning algorithms have proven effective in detection of breast cancer [16].

Using histopathological images and a high classification rate, a CNN model is presented to categorize the various stages of breast cancer. In this study, the image augmentation technique is also employed to offer training variations. Our suggested technique performs better than current cutting-edge techniques.

This is the arrangement of the remaining paper. A synopsis of the relevant works is provided in Portion II. A quick synopsis of the process is provided in Portion III. Portion IV discusses the design and execution of the experiment. The experimental results and discussions are presented in Portion V. There is a denouement, at last, in Portion VI.

RELATED WORKS

Using deep convolutional networks, variable-sized regions of interest (ROIs) across whole slide images can be modelled; however, fixed-sized inputs with adequate contextual and structural data are needed. A deep feature extraction technique generates ROI-level feature representations by weighted aggregation of fixed-sized patches from densely nuclei regions in breast histopathology images. After extracting initial patch-level feature representations from fully-connected layer activations and pixel-level convolutional layer activations, the approach concatenates weighted instances to produce final patch-level representations[1].

Breast cancer is a major global health issue, with various imaging modalities used for diagnosis. By using automated segmentation and self-driven post-processing tasks, this study seeks to create more effective CAD phase strategies.

The proposed technique incorporates spatial information, is independent of magnification, and is fast. The improved segmentation and classification algorithms could reduce incorrect diagnoses and aid early disease detection.[2]

One of the earliest types of cancer known to science was discovered in Egypt [3]: breast cancer. It is brought on by the unchecked growth and division of breast tissues, which results in the formation of a mass of tissue known as a tumor. It is currently one of the most terrifying cancers that affect women globally [4].

In recent years, several significant methods for classifying breast cancer using histopathological images have been reported. Numerous classification schemes, such as binary classification and multi-class classification of breast cancer based on histopathological images that are either magnification-dependent (MD) or magnification-independent (MI), can be applied to all of these studies [5].

Breast cancer is the second leading cause of death, following lung cancer. Computer-assisted processes like mammograms, MRIs, CT scans, ultrasounds, and nuclear imaging can improve diagnosis accuracy. Deep learning algorithms, like convolutional neural networks, can help distinguish benign and malignant tumors in medical imaging.[6]

Over one in ten new occurrences of breast cancer occur each year, making it the most frequent cancer among women.. Early detection using deep learning algorithms is crucial. This study evaluates various models and EfficientNetV2 architecture.[7]

BreakHis, a public breast cancer dataset, addresses limitations in CADs by organizing images into four magnification levels. It allows practitioners to classify images as binary or multi-category using magnification dependent or independent training approaches. There are four categories for the dataset reformulations: Magnification-Specific Binary (MSB), Magnification-Independent Binary (MIB), Magnification-Specific Multi category (MSM), and Magnification-Independent Multi-category (MIM) classifications. [8]

This study suggests a technique for classifying breast cancer that makes use of the Inception Recurrent Residual Convolutional Neural Network (IRRCNN) model. In tasks involving object recognition, the IRRCNN outperforms other neural networks by fusing the

advantages of Inception, Residual, and Recurrent convolutional neural networks. BreakHis and the 2015 Breast Cancer (BC) Classification Challenge are two publicly available datasets that the model is applied to and shows superior classification performance in terms of sensitivity, AUC, ROC curve, and global accuracy.[9]

Breast cancer is a common malignancy affecting women. Vision-based Deep Learning has improved automated diagnostic systems, but reducing training time and resources is crucial. The EfficientNetB3 design outperforms previous architectures in tumor classification tasks, achieving 100% sensitivity and accuracy.[10]

According to this paper, early detection is key to cancer treatment. In this work, we investigated an image-based fractal analytic method for cancer cell identification. One of the most common abnormalities observed in cancer cells is uncontrolled cell development. It is possible to quantify morphological complexity and use fractal analysis to examine figures with unusual shapes. Photos of human breast cancer cells in experiments were used for research. We investigated and contrasted alterations in the fractal dimension between healthy and cancerous cells. Our preliminary results show that the image-based fractal analysis approach can detect breast cancer cells. It has a great deal of potential to serve as a signal for the detection of cancer and the efficacy of cancer treatment..[17]

METHODOLOGY

The paper presents an innovative approach to analysing histopathology section images using a Convolutional Neural Network (CNN). To improve the quality of the images, the work employed multiple pre-processing techniques and image augmentation methods to generate more images for training and testing. Our work was divided into two sections: binary classification of breast cancer using the VGG-16 model and multiclass classification of breast cancer using the same model. The great efficiency and accuracy of the VGG-16 model in image classification tasks led to its selection. The binary classification section aimed to classify breast cancer images as either cancerous or non-cancerous. The multiclass classification section aimed to classify breast cancer images into different types (e.g. ductal carcinoma, lobular carcinoma, etc.). The dataset used in the study is also detailed in the paper. The results of this study may increase the precision and efficiency of breast cancer diagnosis utilizing images from the histopathology section.

TABLE 1

Distribution of overall images in the Break His Dataset for Binary Classification.

Type	Images count	Cancerous (Benign)	Non Cancerous (Malignant)
Total Images	272524		
Standard image	58973	29387	29586

magnification dependent or independent training approaches. The dataset is categorized into four image for the classification of cancerous or non cancerous. The work is divided into two sections. The First one binary classification of breast cancer using VGG-16 is performed. The Second one is multiclass classification of breast cancer. Here also the same VGG-16 model is used. The dataset used in the study is also detailed in the paper. The results of this study may enhance the efficiency and accuracy of breast cancer diagnosis by the use of histopathological images. The next section describes the dataset details

Dataset description.

The dataset for two sections are from the break His dataset which is present in the Kaggle. For Binary classification the images are taken in Kaggle. It contains the total images of 272524. Out of the 272524 images, 69381 are considered standard images for further processing and classification. From this 69381 of standard images, 50418 are non cancerous and 18963 are as cancerous. The training and testing ratios are taken 80:20

The Multiclass classification is done by obtaining the dataset images having the cancer. Here totally 8 types of cancer are classified. DC(ductal carcinoma) , LC (Lobular carcinoma), MC(mucinous_carcinoma), PC(papillary carcinoma), A(Adenosis), F(Fibroadenoma), PT(Phyllodes tumor), TA (tubular adenoma). For this 8000 images are collected and splitting into 7200 for training and 800 for testing.

TABLE 2

Distribution of images for Training and Testing

Type	Training images	Testing images
Binary classification	50412	8561
Multiclass classification	7200	800

Preprocessing

The pre-processing stages involve resizing, . The dataset contains the different size of images and it requires time to modify for the particular process. So by resizing the images, the training and testing could be done in smooth and fast manner. This step is essential to eliminate redundant data from the input, which increases network computational complexity without significantly improving the outcome[15].

In this paper, the workings of the binary classification of breast cancer are shown in block diagram fig. 2. and multiclass classification of breast cancer is shown in block diagram fig. 3.

In binary classification, the dataset is used in a ratio of 80:20 for training and testing of histopathological images, respectively. In the training process, the histopathological image is pre-processed, and data agumentation is done using the VGG-16 model in the CNN network. In the testing process, the trained image is classified as either cancerous or non cancerous.

In multiclass classification of breast cancer, the dataset of histopathological images is split into 80% of the image for training and 20% of the image for testing after the process of pre processing and feature extraction. Here, the VGG-16 classifier is used for training and testing. After this process, output performance is displayed in Accuracy, Precision, Recall, and F1 Score. Then this will be classified into eight types of breast cancer.

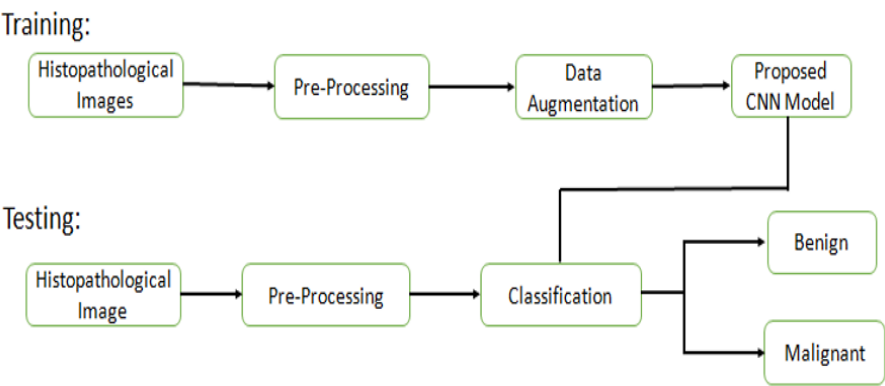

Fig.2. Block diagram - Binary Classification of Breast Cancer

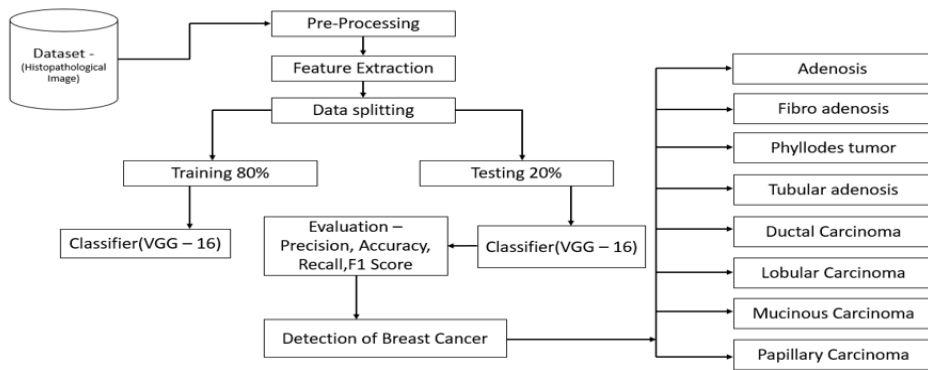

Fig.3. Block diagram - Multiclass Classification of Breast Cancer

RESULTS AND DISCUSSION

Here, feature extraction and binary classification are proposed with the CNN model. The tested images were classified as cancerous or non-cancerous. At first, a total of 272524 images was used for binary classification, and 8000 images were used for multiclass classification of breast cancer at 40× magnification. Using a random oversampling technique, the images of the magnification factor were equalized as needed for training the model. The next 40 epochs for binary classification and 80 epochs for multiclass classification of training were given to the model. The binary classification model accuracy vs epoch in training and model loss vs epoch in validation curve are displayed in fig.4 and fig.7 displays for the multiclass classification of breast cancer. In fig.5, the confusion matrix of Binary Classification is displayed. The accuracy of our model in testing was 85%, 74% precision, 64% recall, and 69% F1 score. In fig. 8, the confusion matrix of Multiclass classification of breast cancer is displayed. The accuracy of our model's testing was 90%, 92.5% precision, 94.8% F1 score, 97.1% recall table.3 and table.4 show our model's overall performance of Binary classification and Multiclass classification respectively.

Fig.4. Binary classification -Model accuracy vs Epoch in Training & Model loss vs Epoch in Validation

Accuracy is high and loss is low in Binary Classification from the training model, indicating minor errors made by the model. When a model's accuracy and loss are high during testing, it indicates that the model makes tiny mistakes on a limited portion of the data, which is the best scenario.

Fig.5. Confusion Matrix - Binary classification

A table that displays the performance of a classification approach is called a confusion matrix. An overview of the performance of a classification algorithm can be seen in a

confusion matrix shown in fig.5. illustrates a confusion matrix in which malignant tissue is referred to as cancerous and benign tissue as healthy. Here the confusion matrix is classified as False Positive (FP), True Positive (TP), False Negative (FN), True Negative (TN).

Fig.6. Performance Matrix - Binary classification

The bar graph that defines the performance of a Binary classification in performance matrix shown in fig.6. illustrate the performance is display in 64% Recall,69% F1 score,74% Precision,85% Accuracy.

Fig.7. Multiclass classification - Model accuracy vs Epoch in Training & Model loss vs Epoch in Validation

Since accuracy is high and loss is low in multiclass classification using the training model, the model makes only minor mistakes. In the best-case scenario, the model would make minor mistakes on a tiny portion of the data, as indicated by low accuracy and loss in the testing.

Fig.8.Confusion Matrix - Multiclass classification

A table that displays the performance of a classification approach is called a confusion matrix. An overview of the performance of a multiclass classification algorithm can be seen in a confusion matrix shown in fig.8.illustrates eight classes performance.

Fig.9.Multiclass classification of Breast cancer-Performance Matrix

The bar graph that defines the performance of a Multiclass classification in performance matrix shown in fig.9. illustrate the performance is display in 97.1% Recall,94.8% F1 score,92.5% Precision,90% Accuracy.

In existing research are worked with single input for both classification from histopathological image with using of CNN model. But in this study, the suggested CNN model took for multiple inputs . Consequently, when compared to other recent works, the suggested approach produced better performance.

TABLE 3
OBTAINED RESULTS FROM BINARY CLASSIFICATION

Accuracy (%)	Precision (%)	Recall (%)	F1score (%)
85	74	64	69

TABLE 4
OBTAINED RESULTS FROM MULTICLASS CLASSIFICATION

Accuracy (%)	Precision (%)	Recall (%)	F1score (%)

Abstract

In today's digitized healthcare landscape, ensuring the security and privacy of medical data is paramount. One critical aspect of safeguarding this sensitive information is encryption. However, verifying whether medical data is appropriately encrypted can be a daunting task, particularly in large-scale networks. This paper proposes an innovative approach to streamline this process by automating Wireshark, a widely used network protocol analyzer. By leveraging automation techniques, our solution facilitates the efficient detection and analysis of encrypted medical data transmissions. Through a series of experiments and case studies, we demonstrate the effectiveness and practicality of our approach in enhancing data security in healthcare environments. This paper presents a significant step towards strengthening the protection of medical data and promoting trust in digital healthcare systems.

INTRODUCTION

With the rapid digitalization of healthcare systems, the exchange of medical data over networks has become increasingly prevalent. While this digital transformation brings numerous benefits such as improved accessibility and efficiency, it also introduces significant security challenges. Among these challenges, ensuring the confidentiality and integrity of sensitive medical information is of paramount importance. Encryption serves as a fundamental tool in safeguarding medical data against unauthorized access and interception.

The encryption of medical data ensures that even if intercepted, the information remains unintelligible to unauthorized parties. However, verifying whether medical data transmissions are properly encrypted within complex network environments can be a daunting task for healthcare organizations. Traditional methods of manual inspection and analysis are time-consuming, resource-intensive, and prone to human error.

To address these challenges, we propose a novel approach that leverages automation to streamline the process of verifying medical data encryption. Our solution focuses on utilizing Wireshark, a widely used network protocol analyzer, to capture and analyze network traffic. By automating Wireshark's functionality, we aim to provide healthcare organizations with a reliable and efficient means of assessing the security of their data transmissions.

This paper presents an in-depth exploration of our automated Wireshark approach, outlining its design, implementation, and evaluation. Through a series of experiments and case studies, we demonstrate the effectiveness and practicality of our solution in detecting encrypted medical data transmissions. Furthermore, we discuss the potential benefits of integrating automated encryption verification into healthcare network monitoring practices.

Overall, our work contributes to the ongoing efforts to strengthen the security posture of digital healthcare systems. By automating the process of verifying medical data encryption, we empower healthcare organizations to proactively identify and address potential security vulnerabilities, thereby safeguarding patient privacy and maintaining trust in the integrity of healthcare data.

TYPES OF MEDICAL DATA

Medical data encompasses a wide range of information related to an individual's health, medical history, diagnosis, treatment, and other healthcare-related activities. Here are some common types of medical data:

1. **Electronic Health Records (EHR):** EHRs contain comprehensive information about a patient's medical history, including demographics, diagnoses, medications, allergies, laboratory test results, and treatment plans.

2. **Medical Imaging Data:** This includes various types of medical images such as X-rays, MRI (Magnetic Resonance Imaging), CT (Computed Tomography) scans, ultrasound images, and mammograms.

3. **Laboratory and Diagnostic Test Results:** Data from laboratory tests, such as blood tests, urine tests, genetic tests, and biopsies, provide valuable insights into a patient's health status, disease progression, and treatment response.

4. **Medication Records:** Information about prescribed medications, dosages, administration schedules, and medication allergies is crucial for ensuring safe and effective patient care.

5. **Vital Signs and Patient Monitoring Data:** Vital signs such as blood pressure, heart rate, respiratory rate, temperature, and oxygen saturation levels are routinely monitored in healthcare settings to assess a patient's physiological status.

6. **Medical Procedures and Surgical Records:** Documentation of medical procedures, surgeries, anesthesia administration, and post-operative care is essential for tracking patient care interventions and outcomes.

7. **Patient Demographic Information:** This includes personal identifiers such as name, date of birth, address, contact details, insurance information, and next of kin details, which are used for patient identification and communication.

8. **Telemedicine and Remote Monitoring Data:** Data generated from remote patient monitoring devices, telehealth consultations, wearable health trackers, and mobile health applications provide valuable insights into a patient's health outside traditional healthcare settings.

9. **Mental Health and Behavioral Health Data:** Information related to mental health assessments, psychiatric diagnoses, counseling sessions, and treatment plans is vital for addressing psychological and emotional well-being.

10. **Public Health Data:** Epidemiological data, disease surveillance data, immunization records, and population health statistics play a crucial role in monitoring and managing public health issues and disease outbreaks.

These are just a few examples of the diverse types of medical data that healthcare professionals and organizations handle on a daily basis. Protecting the confidentiality,

integrity, and availability of this data is essential for ensuring patient privacy, maintaining regulatory compliance, and delivering high-quality healthcare services.

TYPES OF ENCRYPTION

Encryption stands as a crucial means of safeguarding sensitive information by transforming it into a format accessible solely to authorized parties. Various encryption techniques exist, each possessing distinct characteristics and applications. Below is a revised rendition of the provided information:

1. **Symmetric Encryption:** In this approach, a single key is employed for both encryption and decryption purposes. While efficient, ensuring secure distribution of the key is paramount. Well-known examples encompass DES, AES, and Blowfish.

2. **Asymmetric Encryption (Public-Key Encryption):** This method involves a pair of keys—public and private. The public key encrypts data, while the private key decrypts it. RSA, Diffie-Hellman, and ECC are prevalent instances.

3. **Hash Functions:** These cryptographic algorithms yield a fixed-size output (hash value) from input data. Hash functions are commonly utilized for data integrity verification and password hashing. SHA-1, SHA-256, and MD5 serve as prominent illustrations.

4. **Hybrid Encryption:** Blending symmetric and asymmetric encryption, this technique employs symmetric encryption for data encryption and asymmetric encryption for securely exchanging the symmetric encryption key.

5. **End-to-End Encryption (E2EE):** This method ensures data encryption at the sender's end, permitting decryption solely by the intended recipient and thwarting intermediaries from accessing the unencrypted data.

6. **Transport Layer Security (TLS) / Secure Sockets Layer (SSL):** TLS and SSL constitute cryptographic protocols for securing internet communication. They furnish encryption and authentication mechanisms, shielding data transmitted between clients and servers.

7. **Homomorphic Encryption:** This encryption facilitates computations on encrypted data sans decryption necessity, thereby preserving privacy throughout data processing. Its applications span secure cloud computing and privacy-preserving data analysis.

8. **Quantum Encryption:** Capitalizing on principles derived from quantum mechanics, quantum encryption offers theoretically impregnable encryption. Quantum key distribution

(QKD) protocols expedite secure exchange of encryption keys, heralding ultra-secure communication resilient to quantum attacks.

TYPES OF DATAPACKETS

In Wireshark, data packets can be categorized into various types based on their content, protocol, and purpose. Here are some common types of data packets you may encounter when analyzing network traffic:

Ethernet Frames:

Ethernet frames are the basic units of data transmitted over Ethernet networks.

They include fields such as source and destination MAC addresses, EtherType, and payload data.

Ethernet frames encapsulate higher-layer protocols such as IP, TCP, or UDP.

Internet Protocol (IP) Packets:

IP packets are used for transmitting data across IP networks.

They contain source and destination IP addresses, as well as protocol-specific header fields.

IP packets encapsulate higher-layer protocols such as TCP, UDP, ICMP, or IPv6 extension headers.

Transmission Control Protocol (TCP) Segments:

TCP segments are used for reliable, connection-oriented data transmission.

They include fields such as source and destination ports, sequence numbers, acknowledgment numbers, and TCP flags.

TCP segments carry application data and are encapsulated within IP packets.

User Datagram Protocol (UDP) Datagrams:

UDP datagrams are used for connectionless, unreliable data transmission.

They include source and destination ports and length fields, as well as optional checksum.

UDP datagrams carry application data and are encapsulated within IP packets.

Internet Control Message Protocol (ICMP) Messages:

ICMP messages are used for network troubleshooting and error reporting.

They include various message types such as echo request/reply (ping), destination unreachable, time exceeded, and parameter problem.

ICMP messages are encapsulated within IP packets and can be used to diagnose network connectivity issues.

Address Resolution Protocol (ARP) Packets:

ARP packets are used for mapping IP addresses to MAC addresses on a local network.

They include fields such as sender/target MAC and IP addresses, operation code (request or reply), and hardware type.

ARP packets facilitate the resolution of IP addresses to physical MAC addresses within the same network segment.

Domain Name System (DNS) Queries and Responses:

DNS packets are used for domain name resolution and mapping domain names to IP addresses.

They include fields such as query type, query name, response code, and resource records (RRs).

DNS queries and responses are encapsulated within UDP or TCP packets, depending on the message size and transport protocol.

Hypertext Transfer Protocol (HTTP) Requests and Responses:

HTTP packets are used for communication between web clients and servers.

They include fields such as request method, URI, status code, headers, and payload data.

HTTP requests and responses are encapsulated within TCP packets and are used for web browsing, API communication, and other web-based applications.

TECHNOLOGY

1. C# (C-Sharp):

C# is a versatile, object-oriented programming language developed by Microsoft. It is widely used for building various types of applications, including desktop, web, mobile, and enterprise software. In this project, C# serves as the primary programming language for developing the automation tool to interface with Wireshark and analyze network traffic.

Key Features and Benefits of C#:

Rich set of language features for rapid application development.

Integration with the .NET Framework, providing access to a vast library of pre-built functionalities.

Strongly-typed language with modern syntax and support for object-oriented programming principles.

Platform-independent through technologies like .NET Core and .NET 5, allowing for cross-platform development and deployment.

Extensive tooling support and a vibrant developer community for assistance and collaboration.

2. Wireshark:

Wireshark is a widely-used network protocol analyzer that allows for the capture and inspection of network traffic in real-time. It supports a multitude of protocols and provides detailed packet-level information, making it a valuable tool for network troubleshooting, analysis, and security monitoring. In this project, Wireshark serves as the core component for capturing network packets and examining their contents to determine if medical data transmissions are encrypted.

Key Features and Benefits of Wireshark:

Cross-platform support for Windows, macOS, and Linux operating systems.

Powerful packet analysis capabilities, including protocol dissection, packet filtering, and network traffic statistics.

Support for a wide range of network protocols and data formats, ensuring compatibility with diverse network environments.

Extensible via plugins and scripting languages, allowing for customizations and automation of tasks.

User-friendly graphical interface for easy navigation and visualization of network data.

3. Medical Data:

Medical data encompasses a variety of sensitive information related to patients' health, medical history, diagnoses, treatments, and more. Examples of medical data include electronic health records (EHRs), medical imaging files (e.g., DICOM), laboratory test results, medication records, and patient demographic information. In this project, the focus is on analyzing network traffic to identify and verify the encryption status of medical data transmissions.

METHODOLOGY

1. Starting Wireshark Capture Using C#:

To initiate Wireshark packet capture programmatically, a C# application will be developed. This application will utilize the Process class to execute Wireshark with appropriate command-line arguments. These arguments will specify the network interface to capture from and set filters to capture only the relevant traffic. Additionally, the C# application will handle any required permissions or elevation to execute Wireshark with administrative privileges if necessary.

2. Logging into the Dummy Medical Application:

Simulating the login process to the dummy medical application will be accomplished within the C# application. This involves programmatically interacting with the login interface of the application, which could be a web-based form or an API endpoint. HTTP requests will be sent to authenticate the user, ensuring that the login process generates network traffic captured by Wireshark. This traffic will include HTTP requests and responses or any other protocol used for communication with the medical application.

3. Stopping Wireshark Capture Using C#:

Once the login process to the dummy medical application is completed, the C# application will halt Wireshark packet capture. This will be achieved by terminating the Wireshark process or stopping the capture session gracefully. It is imperative to ensure that the captured packet data is saved or buffered for subsequent analysis to prevent data loss.

4. Analyzing Data Packets for Patient Data:

The C# application will feature logic to analyze the captured packet data and identify packets containing patient data. This analysis will entail parsing packet payloads, inspecting packet headers, and applying heuristics to detect patterns indicative of patient information. Utilizing C# libraries or algorithms, relevant information such as dummy electronic health records (EHRs), medical imaging data, or simulated patient demographics will be extracted from packet payloads. Filtering mechanisms will be applied to isolate packets containing dummy patient data based on predefined criteria or patterns.

5. Verification and Reporting:

Verification checks will be performed within the C# application to determine if patient data packets are encrypted. This verification may involve examining packet headers for

encryption indicators or simulating cryptographic analysis on packet payloads. Subsequently, the application will generate reports or alerts to indicate whether patient data transmissions in the dummy medical application are encrypted or unencrypted. These reports will include pertinent details such as packet timestamps, source/destination IP addresses, and encryption status. Logging and auditing mechanisms will be implemented to track analysis results, ensuring accountability and traceability for security assessments of the dummy medical application.

Results and Discussion

The analysis of data packets captured using Wireshark during the simulation of logging into the dummy medical application yielded insightful findings regarding the encryption status of patient data transmissions. Here are the results and corresponding discussions:

1. Encrypted Data Packets:

A subset of data packets was identified to contain encrypted patient data transmissions. These packets exhibited characteristics indicative of encryption, such as encrypted payload contents or encryption-related headers.

Discussion: The presence of encrypted data packets signifies that the dummy medical application employs encryption mechanisms to protect patient data during transmission. This is a positive outcome, as encryption enhances data security and confidentiality, mitigating the risk of unauthorized access or interception.

2. Unencrypted Data Packets:

Another subset of data packets was observed to contain unencrypted patient data transmissions. These packets lacked encryption indicators and exhibited plaintext payload contents.

Discussion: The identification of unencrypted data packets raises concerns regarding the security of patient data within the dummy medical application. Unencrypted transmissions pose a significant risk to patient privacy, as sensitive medical information could be intercepted and accessed by unauthorized parties. It highlights the importance of implementing robust encryption measures to safeguard patient data during transmission

3. Mixed Encryption Status:

In some instances, data packets exhibited a mixed encryption status, with portions of the payload encrypted while other portions remained unencrypted.

Discussion: The presence of mixed encryption status suggests potential inconsistencies or shortcomings in the encryption implementation within the dummy medical application. It underscores the need for thorough evaluation and validation of encryption mechanisms to ensure comprehensive protection of patient data throughout the transmission process.

4. Encryption Protocols and Algorithms:

Analysis of encrypted data packets revealed the use of various encryption protocols and algorithms, including TLS (Transport Layer Security), AES (Advanced Encryption Standard), and RSA (Rivest-Shamir-Adleman).

Discussion: The utilization of established encryption protocols and algorithms demonstrates a commitment to employing industry-standard security practices within the dummy medical application. These encryption mechanisms offer strong cryptographic protection against eavesdropping and data tampering, enhancing the overall security posture of patient data transmissions.

5. Recommendations for Improvement:

Based on the findings, it is recommended that the dummy medical application undergo further evaluation and enhancement of its encryption mechanisms.

Strengthening encryption implementation to ensure comprehensive coverage of all patient data transmissions.

Regular monitoring and auditing of network traffic to detect and address any instances of unencrypted data transmissions promptly.

Continued education and training for personnel involved in the development and maintenance of the medical application to promote awareness of encryption best practices and security standards.

CONCLUSION

The analysis of Wireshark data packets provided valuable insights into the encryption status of patient data transmissions within the dummy medical application. While the presence of encrypted data packets reflects a proactive approach to data security, the identification of unencrypted or inconsistently encrypted transmissions underscores the need for ongoing vigilance and improvement efforts to safeguard patient privacy effectively. By addressing these findings and implementing recommended measures, the security and integrity of patient data can be significantly enhanced, ensuring compliance with regulatory requirements and fostering trust in the confidentiality of healthcare information.

ABSTRACT

Hemagaphis Coloratta presents a transformative leap in wound care technology, offering a novel wound dressing film derived from meticulously processed Hemagaphis plant leaves. Through a meticulous manufacturing process involving drying, grinding, and ethanol extraction, the film harnesses the inherent medicinal qualities of the Hemagaphis plant, renowned for its hemostatic and wound-healing properties. Laboratory tests rigorously validate its biocompatibility and therapeutic efficacy, ensuring its safety and functionality in medical environments. Clinical trials attest to the multifaceted benefits of Hemagaphis Coloratta, demonstrating its effectiveness in infection prevention, wound healing acceleration, and bleeding reduction. Noteworthy is its soft adhesive, which facilitates painless dressing changes, thereby enhancing patient comfort and compliance—a pivotal aspect of effective wound management. Moreover, Hemagaphis Coloratta embodies a holistic approach to wound care by integrating natural healing principles with advanced monitoring capabilities. This fusion enables healthcare providers to gain real-time insights into wound healing dynamics, facilitating personalized treatment strategies and timely interventions. In essence, Hemagaphis Coloratta represents a convergence of nature and science, epitomizing the pinnacle of wound care technology. Its meticulous extraction methodology and stringent quality control measures underscore its transformative potential in enhancing patient outcomes and elevating standards of care.

Abstract

Agronomic efficiency has a considerable influence and countries heavily rely on agriculture as a significant contributor to their respective economies. Pests and illnesses in grain plants harm major production and result in significant losses for the worldwide economy. Caring for the strength and initial recognition of infections in plants is decisive for supportable agronomy. Getting an idea of early disease detection can help farmers in bug control by selecting appropriate bug resistor measures to raise the yield. Manually identifying diseases in grain plants can result in misleading pesticide assessments. Diseases inside a plant are typically detected in the leaf, stem, flower, and fruit. It can be simpler to identify plant illness from the leaf than from the stem, blossom, or fruit since disease symptoms typically develop first on the leaf. The efficiency of a classifier is determined by its feature extraction algorithm. Thus, it is critical to use an effective technique for feature extraction, selection, and optimization. As a result, it is critical to develop an instinctive leaf disease recognition mechanism that can identify the nature of illness. Image processing and computer vision techniques can help detect and classify leaf diseases automatically. However, the existence of the disease identification process occurs in closely equivalent segments in all computational systems. As imaging techniques are affordable, The obtained leaf metaphors from the arena utilizing devices and photographic cameras undergo four primary steps: pre-processing, segmentation, feature extraction, and classification. Image

fusion is a new field that generates an enlightening model by combining patterns from several devices for effective management.

Keywords

CNN, Feature Fusion, Deep Learning.

Introduction

Agriculture is extremely important to the financial system of a nation such as India, as it employs the majority of the people. When seedlings are infected by bugs, their output is significantly reduced. Late identification of plant disease results in reduced output and seedling death. Experts manually detect infections in plants on numerous estates of land, which takes a huge number of professionals and increases production costs. Enhancement of an automatic leaf disease detection and categorization framework is being pursued in modern agriculture practice. Diseases within plants are typically detected in the leaves, stems, flowers, and fruits. It is easier to detect plant illness from leaves than from stems, flowers, and fruits since the symptom of disease usually emerges first on leaves. The automated plant-pathogen system has evolved in recent years to suit the rapidly expanding demand for accurate grain production monitoring. Despite the availability of these approaches, there is a need for reliable, accurate, quick, robust, and efficient improved plant disease detection techniques for the pathogen in the plant at an early stage to benefit economic, production, and agricultural purposes. As a result, research is critical for the early detection of plant diseases to boost agricultural production and meet the demands of the world's rising population. Imaging techniques are low-cost and non-destructive, they are increasingly being employed in disease monitoring systems to identify illnesses and stress in plants and trees. However, the presence of the disease detection process occurs in nearly comparable phases in all computational systems. As imaging techniques are affordable, the obtained plant images from the field utilizing sensors and cameras go through four primary steps: pre-processing, segmentation, feature extraction, and classification [2].

Associated Works

The inception of CNNs dates back to LeNet, introduced by LeCun in 1998, primarily aimed at handwritten digit recognition. Since then, CNNs have evolved with a standard

architecture consisting of convolutional, pooling, and fully connected layers. The pivotal moment came with AlexNet in 2012, pioneered by Krizhevsky, which introduced significant enhancements like ReLU activation, leading its triumph in ILSVRC2012. Subsequent to AlexNet, CNNs witnessed a surge in research attention, resulting in three prominent developmental trajectories: (a) deeper networks exemplified by VggNet and ResNet, (b) modularization represented by GoogleNet and Inception series, and (c) lightweight models tailored for gadgets like SqueezeNet, MobileNet, and ShuffleNet [3]-[17].

Convolutional Neural Network

CNNs, designed primarily for image analysis, have revolutionized various domains consisting of, extracting, analysing, and interpreting visual data from images or video., computers to understand, interpret, and generate human language in a manner that is both meaningful and contextually appropriate., aiding in diagnosis, treatment planning, and medical research. These networks employ convolution to learn hierarchical features from input photographs, which has a significant impact on tasks like the classification of images, identification of objects, and segmentation of images. Their purpose is to automate the acquisition of a spatial hierarchy of characteristics from incoming images using a method referred to as convolution. For identifying the objects directly from photographs, researchers invented the Convolutional Neural Network (CNN), a deep learning model that resembles Artificial Neural Networks that consider even the single pixel in the image as a feature. CNN is commonly used for evaluating the visual images. The general architecture of CNN is shown in Figure 1.

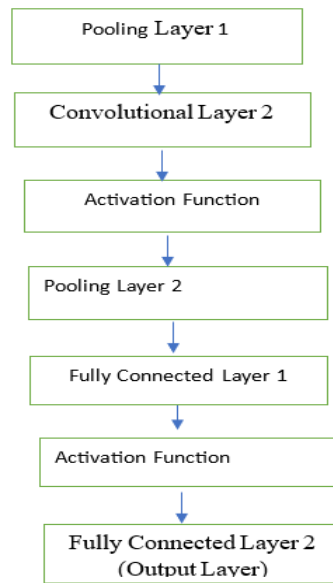

Figure 1: General architecture of CNN

Feature Fusion

Image fusion (IF) is a new area that generates an expository image by combining images from several detectors to make wise judgments. [18]. Enhancing both the logical and visual clarity of images can be achieved through the fusion of multiple images. Efficient image fusion techniques preserve important details by integrating relevant information from each photo, thus ensuring consistency in the resulting image. Following fusion, the composite image becomes more suitable for both machine-based processing and human interpretation. The first step in fusion involves image registration (IR), where the source image is aligned with the reference image. This alignment ensures that comparable images are matched based on reliable characteristics, facilitating subsequent analysis. Both image fusion (IF) and image registration (IR) are considered essential processes in this context. The goal of analytics is to generate valuable information in a variety of domains [19].

Image fusion approaches are categorized into three types: pixel level, decision level, and feature level. Pixel-level image fusion approaches immediately integrate information from input images into subsequent system processing tasks [20]. Feature-level strategies for image fusion involve the extraction of relevant features such as pixel intensities, textures, or edges, which are then compounded to create supplemental fused features [21,22].

An image classification algorithm using superpixels and feature fusion is employed by Feng Yang et al [1]. It employs an excellent picture classification technique that relies on super pixels and feature fusion. Unlike traditional image classification algorithms, which extract feature forms straight from the primary picture, the planned process splits the given picture into superpixels, later calculates multiple distinct kinds of features based on these super pixels.

Proposed work

The proposed research aims to fill the research gap and boost confidence among farmers and agriculturalists. This approach addresses crop productivity issues by identifying and addressing unhealthy leaves. Previous plant leaf disease classification systems have low-performance metrics, including accuracy, sensitivity, and specificity. To reduce execution time, features must be carefully picked and tuned. If the processing time is reduced, this method could potentially be utilized in live applications for identifying diseases from video footage. The feature retrieval procedures are not only sophisticated but also inaccurate. The extraction of features largely depends on the exact position of the leaf images. Image features vary based on their position. Adding additional features increases the classifier's processing time and complexity. Therefore, it's important to select the most appropriate quantity of features. The proposed methodology is given in Figure 2.

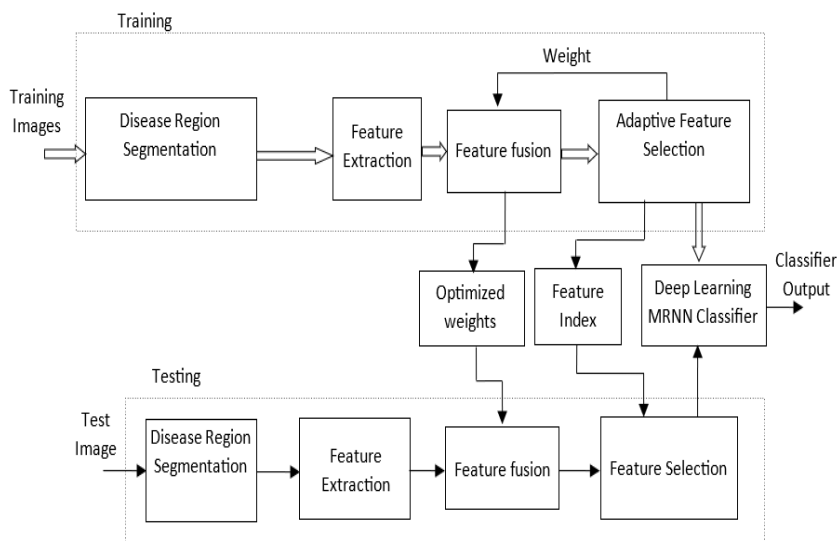

Figure 2: Proposed methodology

Research Methods

This work presents an AI-based approach for identifying plant diseases by using leaf photos. Detecting plant leaf diseases involves three primary processes: segmentation, feature extraction, and classification. In segmenting, it separates the disease-affected portion of a leaf from the unaffected area. Extracting features involves extracting valuable features from an image to represent the diseased location. These features are used to train and test the classifier. The classification method categorizes and identifies diseases in segmented findings. The classifier's ability to identify diseases is solely dependent on segmentation and feature extraction results. If the amount of characteristics derived is larger it will take time to train it. So, feature selection and feature fusion are used to maximize the features.

Dataset

Photographs are extracted from the Plant Village collection dataset, which includes over 49,000 skillfully picked photographs of healthy and diseased crops or plant leaves. These data are the result of a crowdsourcing attempt to assist computer vision approaches in solving challenges linked to yield reduction caused by bacterial or fungal illnesses. Plant Village's leaf image dataset is available at www.plantvillage.org. The dataset contains images depicting various leaf diseases such as black rot, common rust, Cercospora leaf spot, apple scab, bacterial spot, and healthy leaves, as shown in Figure 3, and sample images are shown in Figure 4. The training set consists of 1240 images for healthy leaves, 1200 images for Early Blight, 1242 images for Black Rot Spot, 1260 images for Apple Scab, 1260 images for Cercospora Leaf Spot, and 1207 images for Bacterial Spot. Total 7409 images in the set, while the testing set also includes 500 images per category, resulting in a total of 3,000 images as well. Data for sample images and data count is given in Figure 5.

Figure 3: Categories of Leaf Disease (a) Early Blight, (b) Downy Mildew, (c) Common Rust, (d) Powdery Mildew, (e) Mosaic Virus, (f) Leaf Spot

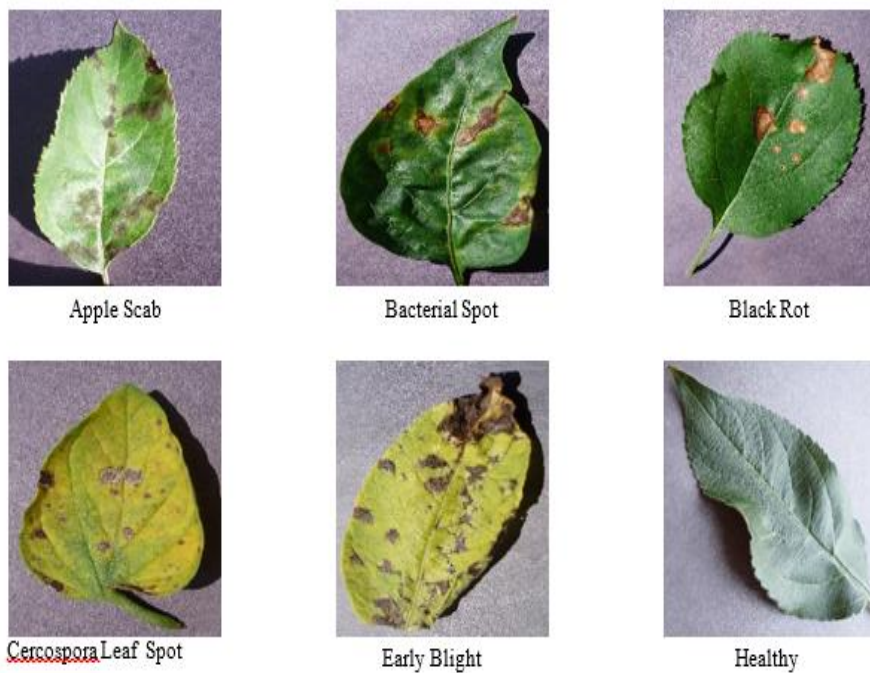

Figure 4: Trial images from the dataset

Image Count

Apple Scab=1260

Cercospora Leaf Spot=1260**Figure 5: Sample Images and Image Count****Experimental Design**

An algorithm was applied to a pre-trained convolutional neural network using Python and Google Colab with runtime T4 GPU cloud system. Pandas are used for data manipulation. The Dataset contains 6 folders and it contains 6 types of leaves classifications. Each folder contains 1207 images. It undergoes Supervised Learning and is trained using numerical values. In the test and train set 80 percent of the dataset is used for training and the remaining 20 percent is used for testing purposes. All images underwent resizing before the training phase to meet the requirements for input dimensions i.e. 256x256x3 pixels. The given parameters were utilized for training the network batch size=16, number of classes=6, and number of epochs=30.

Results and Discussion

The effectiveness of the proposed system will be assessed based on parameters such as accuracy, sensitivity, and specificity. They are categorized as true positive, true negative, false negative, and false positive. True positive and true negative signifies a consistent outcome between the test and the established condition.

Sensitivity, Specificity, and Accuracy are quantified using T_j , T_m , N_j , and F_q as follows:

$$\text{Sensitivity} = \frac{T_j}{T_j + N_j} \quad (1)$$

$$\text{Specificity} = \frac{T_m}{T_m + F_q} \quad (2)$$

$$\text{Accuracy} = \frac{T_m + T_j}{T_m + T_j + N_j + F_q} \quad (3)$$

The proposed algorithm shows 96% accuracy, 93% sensitivity, and 93% specificity compared to previously compared algorithms. Performance comparison metrics are given in Figure 6, 7, and 8.

Figure 6: Performance Metrics

Figure 7: Performance Metrics

Figure 8: Performance Metrics

Convolutional Neural Networks (CNNs) primarily study the features and characteristics that exist in the training dataset. If the features of the images in the testing set significantly differ from those in the training set, it's anticipated that the accuracy will be low. A comprehensive training set can alleviate this issue to some extent, as the network becomes adept at handling a wide range of images, leading to higher expected accuracies. The reported accuracies in the literature will largely reflect the similarity (or dissimilarity) between the characteristics present in both datasets. Therefore, the entire outcomes documented in the works are only relevant to the specific test groups employed in those tests. After the classification of new models by the network, precisions may rise if the features of the new images closely match those in the training set, or decline if the features are more varied.

Conclusion

Plant disease identification and categorization have seen widespread application of deep learning techniques. It has partially or fully fixed difficulties with traditional machine learning techniques. Image classification, target identification, and image segmentation are examples of the primary applications for DL, a subset of machine learning. This study analyzed neural networks from the most recent season for the classification of plant leaf diseases. Classification approaches make it easier to detect plant leaf diseases and categorize them based on morphology. The experimental evaluation utilized the Plant Village dataset, which encompasses a range of leaf diseases. The proposed leaf disease detection algorithm

exhibited an average specificity of 92.59%, sensitivity of 93.82%, and accuracy of 96.19%. Also, it helps determine how plant excitability may influence future plant disease classification and the integration of server and client-side technology.

Abstract

Bacillus species are widely distributed microorganisms known for causing food poisoning and spoilage. This study aimed to isolate and identify Bacillus species linked to foodborne illnesses from canned/packed foods and the environment samples. Additionally, it evaluated the antimicrobial properties of specific green leaf powders. Seventy samples were collected from Salem, Namakkal, and Trichy in Tamil Nadu, South India. Bacillus species were identified using morphological, biochemical, and 16S rRNA gene sequencing. The antibacterial effects of dried green leaf powder were assessed with UV spectroscopy, showing a significant reduction in Bacillus counts. Notably, Centella asiatica and Moringa olifera demonstrated potent antibacterial activity among the herbal powders tested. Sesbania grandiflora, Hibiscus cannabinus and Rumex vesicarius exhibited no significant antibacterial activity among the tested herbal powders.

ABSTRACT

Hyperlipidemia refers to elevated levels of lipids and cholesterol in the blood, and is also identified as dyslipidemia that describes the manifestations of different disorders of lipoprotein metabolism. It is also key factor for the development of heart and coronary diseases and atherosclerosis. In the present study Hypolipidemic activity of Adhatoda vasica leaves extract was analysed. A. vasica ethanolic and aqueous extract showed that the tannin, saponin, flavonoids, steroids, terpenoids, triterpenoids, alkaloids, anthraquinone, polyphenol, glycoside and coumarins were present. Quantitative analysis revealed that A. vasica leaves has significant amount of flavonoids, phenol and terpenoid. Histochemical analysis of A. vasica powder further confirmed the presence of phytochemicals. Fluorescence analysis of A. vasica leaves powder was also performed. The result of UV-Visible spectroscopic analysis confirms the presence of phenolic compounds in the leaves extract. Separation and identification of flavonoids was done using Column chromatography and TLC. The leaves extract inhibited lipase activity in a concentration-dependent on in vitro assay with low concentration of 18.54 % and the higher concentration of 71.25 %. This results proved the hypolipidemic activity of plant extract. Thus the present study concluded A. vasica leaves extract contain rich source of phytochemicals and proved to be effective for inhibition of lipase activity which play a major role in lipid deposition in body tissues. The potential hypolipidemic activity of A. vasica may be due to the presence of phenolic groups which can be further evaluated as novel drug candidate.

INTRODUCTION

Hyperlipidemia is a significant risk factor for the development of atherosclerosis and cardiovascular disease. Atherosclerosis is an accumulation of lipids, blood components, and calcium deposits in arteries, leading to the formation of atheromatous plaques that restrict blood flow. The origins of atherosclerosis are multi-factorial, with factors such as sex, family history, hypertension, smoking, dyslipidemia, and diabetes mellitus contributing to its occurrence. Risk factors for atherosclerosis can be classified into congenital, modified, classical, or non-classical. Modifiable factors include diabetes, dyslipidemia, high serum concentration of low-density lipoprotein (LDL), low serum concentration of functioning classical, or non-classical. Modifiable factors include diabetes, dyslipidemia, high serum concentration of low-density lipoprotein (LDL), low serum concentration of functioning high-density lipoprotein (HDL), an LDL:HDL ratio greater than 3:1, tobacco smoking, hypertension+, elevated serum C-reactive protein concentrations, and vitamin B6 deficiency. Non-modifiable factors include advanced age, male sex, close relatives with atherosclerosis complications, and genetic abnormalities. Lesser or uncertain factors include obesity, sedentary lifestyle, hypercoagulability, postmenopausal estrogen deficiency, high intake of saturated fat, trans fat, high carbohydrate intake, chronic systemic inflammation, stress, hyperthyroidism, elevated serum insulin levels, short sleep duration, and Chlamydia pneumoniae infection. Atherosclerosis typically begins in early adolescence and is found in major arteries. Symptoms include shortness of breath and tightening chest pain, but usually not visible until a complication occurs. The pathophysiology of atherosclerosis involves remodeling of arteries leading to subendothelial accumulation of fatty substances called plaques. The buildup of an atheromatous plaque is a slow process, developed over several years through a complex series of cellular events within the arterial wall and in response to local vascular circulating factors. Herbal medicine has gained interest due to its potential anti-thrombotic, cardioprotective, anti-atherosclerotic, hypoglycemic, hypolipidemic, anti-inflammatory, and anti-arthritic properties. Adhatoda vasica leaves, a tree belonging to the Solanaceae family, have been used to evaluate hypolipidemic activity.

MATERIALS AND METHODS

The *Adhatoda vasica* leaves powder was collected in February 2021 from a medical shop in Thanjavur, Tamil Nadu, India. The extract was prepared by preparing one gram of powder in 50 ml of different solutions (methanol and water) and shaking it well for 30 minutes by free hand. The extract was filtered using Whatman filter paper No.1 and the filtrate used for further analysis. Phytochemical screening was carried out on the extract using standard procedures to identify the constituents. Tannins were tested for brownish green or blue-black coloration, saponin for brownish green or blue-black coloration, steroids for violet to blue or green in some samples, terpenoids for Salkowski test, triterpenoids for reddish violet coloration, alkaloids for Mayers test, anthraquinones for rose pink coloration, polyphenols for blue green coloration, cardiac glycosides for cardenolides, and coumarins for coumarins. Quantitative analysis of phytochemicals was performed using spectrophotometric methods, determining total phenols by spectrophotometric method, and estimating total terpenoid content by standard method. Histochemical tests were conducted on the *Adhatoda vasica* leaves powder, with the powder treated with specific chemicals and reagents. The methanol extract was examined under UV and visible spectroscopic analysis. Fluorescence behavior of the plant powder was determined by determining the fluorescence behavior of the seeds powder of *Adhatoda vasica* in daylight and under UV light. The methanol extract was then separated using column chromatography, which is a form of adsorption chromatography. The column was then dried and analyzed for flavonoid compounds.

IN VITRO HYPOLIPIDEMIC ACTIVITY

In vitro hypolipidemic activity was studied by Shivani et al. (2017) using different concentrations of extract in olive oil, phosphate buffer, and lipase. The extract's cytotoxicity was determined by titrating the solution against sodium hydroxide and calculating the percentage inhibition of lipase activity. Statistical analysis was performed for 35 separate experiments, estimating the IC₅₀ required to inhibit free radical concentration by 50%.

RESULT DISCUSSION

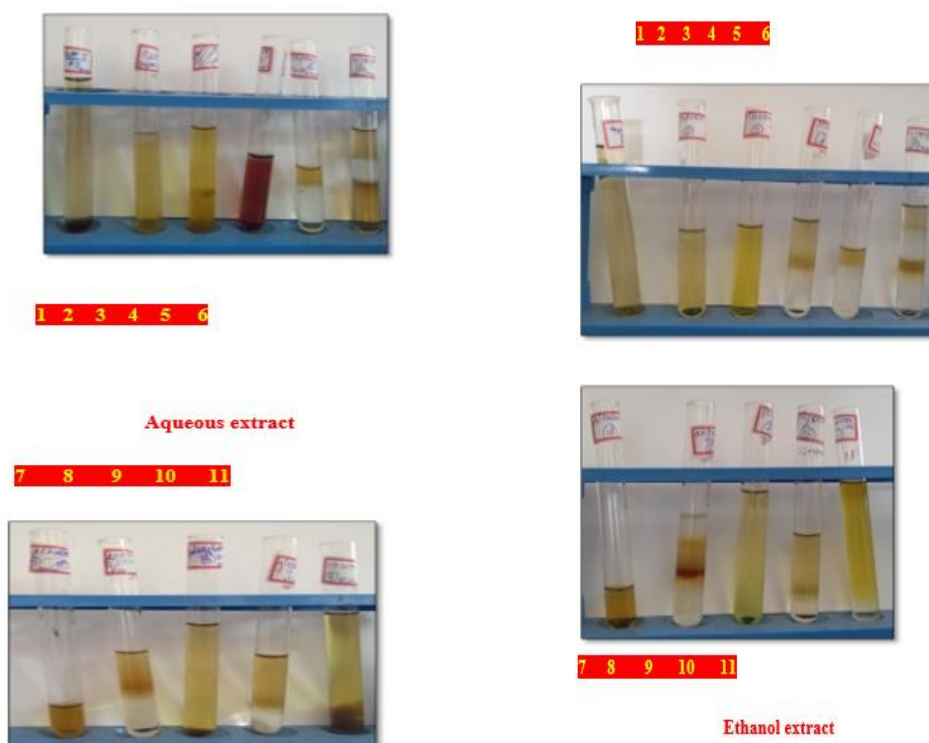

Plants play a crucial role in disease prevention and treatment, and India is the largest producer of medicinal herbs. They contain chemical compounds of biological and pharmacological importance, including antimicrobial activities. In this study, the phytochemical and hypolipidemic activity of *Adhatoda vasica* extract was investigated. The extract showed the presence of tannin, saponin, flavonoids, steroids, terpenoids, triterpenoids, alkaloids, anthraquinone, polyphenol, glycoside, and coumarins. Flavonoids are a group of polyphenolic compounds with known properties such as free radical scavenging, inhibition of hydrolytic and oxidative enzymes, and anti-inflammatory action. The extract also contained tannin, saponin, flavonoids, steroids, terpenoids, triterpenoids, alkaloids, anthraquinonepolyphenol, glycoside, and coumarins. Quantitative analysis revealed that the *Adhatoda vasica* leaves extract contained flavonoids, phenol, and terpenoid. A significant amount of flavonoids (50mg/gm), phenol (190.00 mg/gm), and terpenoid (30.00 mg/gm) were present. Flavonoids are potent water-soluble antioxidants and free radical scavengers, which prevent oxidative cell damage and have strong anticancer activity. They have been referred to as nature's biological response modifiers, as they modify the body's reaction to allergies and viruses. Anthraquinones possess antiparasitic, bacteriostatic, antidepressant, and antimicrobial and antioxidant activities. Their potential effects against cancer through different mechanisms have been studied. Tannins have stringent properties, hastening wounds, and inflamed mucous membranes, and are responsible for color changes in food. Historical analysis of the *Adhatoda vasica* powder confirmed the presence of phytochemicals, with tannins showing black color, flavonoids yellow, terpenoids orange, and polyphenol blue. Histochemical studies enable quick and inexpensive evaluation of medicinal potential in taxonomically close species, reducing costs and increasing the safety of traditional medicines. However, histochemical studies are rare in *Solanum*, a widely distributed genus with 269 species in Brazil. Most pharmacogenetic analyses focus on leaves of one or two species, while anatomical studies focus on taxonomy. Fluorescence analysis of *Adhatoda vasica* powder was conducted in daylight and under UV light. The study aimed to identify flavonoids compounds from *Adhatoda vasica* extract using column chromatography and thermal vapor chromatography (TLC). The extract yielded three fractions, with the methanol and chloroform fractions being the most

significant. The methanol and chloroform fractions were chromatographed by thin layer chromatography, showing an R_f value of 0.57 and comparing it with the flavonoids standard. The study also screened *Adhatoda vasica* leaves extract from natural sources as potential hypolipidemic agents by monitoring their anti-lipase activity. The results showed that *Adhatoda vasica* leaves extract significantly inhibited lipase activity at concentration-dependent levels. The half inhibition concentration (IC_{50}) of Orlistat ($254.91\mu\text{g/ml}$) and *Adhatoda vasica* leaves extract ($311.64\mu\text{g/ml}$) were significantly lower than the standard. Medicinal plants have played a vital role in inhibiting pancreatic lipase to reduce cholesterol, with various plants playing a vital role in inhibiting pancreatic lipase to reduce cholesterol. The highest concentration was closest to the standard.

CONCLUSION

Hyperlipidemia is a condition characterized by elevated serum total cholesterol, low density, and very low-density lipoprotein levels, which can lead to atherosclerotic cardiovascular disease. Treatment for hyperlipidemia aims to reduce the risk of developing ischemic heart disease or further cardiovascular or cerebrovascular disease. Currently, available hypolipidemic drugs have side effects, such as hyperuricemia, diarrhea, nausea, myositis, gastric irritation, flushing, dry skin, and abnormal liver function. Medicinal plants have been studied for their immune potential against various diseases. A study found that *Adhatoda vasica* leaves contain a rich source of phytochemicals, including tannin, saponin, flavonoids, steroids, terpenoids, triterpenoids, alkaloids, anthroquinone, polyphenol, glycoside, and coumarins. The leaf extract inhibited lipase activity, with a concentration-dependent in vitro assay showing a 18.54% inhibition. The potential hypolipidemic activity of *Adhatoda vasica* may be due to the presence of phenolic groups.

Abstract

Green synthesized metallic nanoparticles are an evolving environment-friendly technique in recent years. The biological processing of palladium (Pd) nanoparticles by employing *Allium fistulosum* and *Tabernaemontana divaricate* leaf extracts was described in our current study. The prepared Pd NPs were further undergoing characterization via Fourier transform infrared, Scanning, and Transmission electron microscopy. Furthermore, validation of Pd NPs creation was established through UV-visible spectrophotometer. Our SEM analysis results represented spherical morphology with a dimension of 2 μm for both the extracts of *Allium fistulosum* and *Tabernaemontana divaricate* synthesized Pd NPs. TEM images of both the extracts designated synthesized Pd NPs were moderately unvarying in diameter as well as its figure as a range of 2 to 5 nm. Eventually, anti-bacterial activity was also determined for both the extracts. Amongst, Pd NPs synthesized with *Allium fistulosum* demonstrated a good zone of inhibition against most of the bacterial strains. The findings are highly positive, demonstrating a significant increase in the activity of the undamaged fractions. The use of biological sources to synthesize NPs adds a new dimension to all application areas.

Abstract

Harmonia axyridis plays a vital role in agricultural crop damage and affects humans during winter. Insecticide helps to avoid these types of insects and helps to increase crop production by enhancing the quality and quantity of the crops. The usage of chemical insecticides leads to various environmental and human issues. To overcome this issue, herbal insecticides will be an alternative source, as they have little or no side effects on the environment and humans. Our research aims to find the insecticidal action of Mentha spicata, Coriandrum sativum, and Solanum lycopersicum against Harmonia axyridis. An insecticidal activity of extracts obtained from Mentha spicata, Coriandrum sativum, and Solanum lycopersicum leaves was tested towards Harmonia axyridis. Diverse developmental stages of insects were exposed to all three extracts that are present in the substratum. The extracts were employed in different concentrations of 1, 10, 100, or 1000 ppm. Here, distilled water was utilized as a control. Phytoconstituents present in the sample were analyzed by qualitative phytochemical analysis. The hydroalcoholic extract has various phytochemicals like resins, carboxylic acid, tannins, steroids, flavonoids, and carbohydrates. It was interesting to note that, 80% of mortality was obtained at all concentrations and 100% of mortality in all concentrations except 10 µg/ml. Thus, the extract has good insecticidal activity against Harmonia axyridis. Therefore, we conclude from this study that all the extracts may be a source of substances that will be used in insect pest management for plant protection.

Abstract

Probiotics are living microorganisms, that mainly have several advantages on human health. Nowadays, demands for non-dairy probiotic beverages are increasing day by day as vegetarianism is becoming popular especially in developed countries, due to factors such as lactose intolerance and cholesterol content associated with the intake of probiotic dairy-based products. Cucumber (*Cucumis sativus*), Musk melon (*Cucumis melo*), and White Pumpkin (*Benincasa hispida*) are a good source of nutrients. Whey and whey-based products contain relatively high levels of lactose, which forms a suitable substrate for probiotics and increases calcium absorption. In the present study work, to utilize cucumber-Muskmelon-white pumpkin with whey water to develop a fermented beverage, formulated cucumber-Muskmelon-White pumpkin with whey water was evaluated as a potential substrate by using *Lactobacillus acidophilus*, probiotic fermented juice can be produced. Numerous factors such as Sensory analysis and fermentation time were optimized based on growth and other physicochemical parameters such as pH, Total Soluble Solids, and Titratable Acidity. The optimization process involving cucumber-muskmelon-white pumpkin-whey composition and fermentation duration led to specific values for viable cell count, pH, and titratable acidity in the fermented juice after 24 hours, indicating a promising outcome for probiotic development. Subsequently, during the 56-day storage period at 2-4 °C, a gradual decline in probiotic viability was observed alongside subtle fluctuations in physicochemical parameters such as pH decreases and titratable acidity increases, highlighting the dynamic nature of probiotic beverages during cold storage.

Keywords

Introduction

Recently, consumers have become more aware of diet's effects on health. As functional foods contain physiologically active components, they offer health benefits beyond those associated with basic nutrition (Sady, M.,2017). The probiotic foods are those that contain living microorganisms and are healthy for the body. The majority of probiotic products are dairy-based. Consumption of probiotics has many health benefits for humans, and it plays a crucial role in digestion (Begum, T., 2019). Ingestion of probiotics is beneficial in reducing serum cholesterol, reducing lactose intolerance, reducing cancer risk, and improving resistance to enteric pathogens (Manasi Shukla, M. S., 2013). Lactobacillus and Bifidobacterium are the most commonly found probiotics. Most probiotics are gram-positive, usually catalase-negative, rods with rounded ends, and occur in pairs, the shorter or longer chains. They're non-flagellate, nonmotile, and non-spore-forming, and they're intolerant to salt. The optimum growth temperature for most probiotics is 37 C, but some strains such as Lactobacillus acidophilus prefer to grow at 30 C while the optimal pH of first growing is 6.57 C (Von Wright, A., 2019). As a by-product of cheese and paneer manufacturing, whey is predominantly produced by the dairy industry. During the manufacturing process, whey is discarded, causing a crucial pollution problem in the environment. In addition to being beneficial to the environment, Whey can also increase the economy of manufacturers (Mustafa et al., 2021). There are several properties of whey and whey proteins, such as antioxidant activity, antimicrobial activity, immune-stimulating and anticancer properties, and the ability to reduce blood pressure, the risk of cardiovascular disease, osteoporosis, and satiety (Skryplonek, K., 2019). Fruits are rich in vitamins, antioxidants, and fiber and have good sensory qualities (Sady, M.,2017). Fruit juice is a nutrient-rich beverage. Fruit juice strengthens the body's immune system, helping to maintain a healthy water balance in your body. The occurrence of coronary heart disease is prevented by the consumption of fruits. Cucumber, Muskmelon, and White pumpkin (*Benincasa hispida*) are the member of the family Cucurbitaceae. Cucumber is known for its

highly refreshing and health-promoting qualities. The fruit provides only 15 calories per 100 g of fruit, which is very low calorie. Cucumber contains a good amount of vitamin K (17 µg/100 g) and potassium (147 mg/100 g), very low sodium (2 mg/ 100 g), and no saturated fat or cholesterol (Garg, N., 2015). Muskmelon is recommended for the treatment of cardiovascular disease, as a diuretic, stomachic, antitussive, and vermifuge combination. Muskmelon's nutrient content is low in calories, fat, and sodium, but it is a good source of potassium and vitamin C (Milind, P., 2011). white pumpkin is used in Ayurveda to treat peptic ulcers as it has anti-vascular inflammation properties (Ravi, U., 2010). The addition of probiotics to fruit juice is appropriate, as it contains a high proportion of sugars, oxidants, and vitamins other than the low pH (Silva et al., 2016). In the present study, to develop a gut pro flora drink from muskmelons, cucumbers, and white pumpkins incorporated with whey water and probiotics that can protect our bodies from contracting various disease conditions. A product containing probiotics should have a viable count of 10^6 CFU/ml to receive their benefits (Shirin et al., 2016). Due to the growing potential of the market, beverages made from fruits and dairy products are now receiving significant attention. Compared to other beverages, whey mixed fruit drinks are more appropriate for human consumption in terms of health (Naina and Neeraja, 2012). The produced fermented fruits-whey beverage makes whey a healthy and tasty product with extended shelf life, which has a positive effect on several different functions in the body. In other words, the loss of underutilization in whey is converted into a 100% gain (Arsić, S., 2018). Because of these facts, experiments will be carried out to standardize a probiotic beverage using whey and fruit juice and the functional characteristics and storage behavior of the developed beverages will be investigated.

MATERIALS AND METHODOLOGY

The present investigation was conducted in the Department of Food Science and Nutrition, Periyar University, Salem from 18/01/2024 to 10/04/2024. In this chapter, materials and methods used for the present research are discussed under a variety of appropriate headings.

Materials

- **Procurement of raw materials**

The raw materials that were required for the research work include Cucumber (*Cucumis sativus*), Muskmelon (*Cucumis melo*), and White pumpkin (*Benincasa hispida*). These vegetables were procured from the local market of Salem, Tamil Nadu. The whey water was prepared according to standard procedures. The freeze-dried culture of *Lactobacillus acidophilus* was obtained from Zydus Healthcare Limited, Kumrek, Sikkim, India.

Medium preparation

- **Preparation of MRS broth**

As per the manufacturer's instruction, MRS broth was prepared by following steps:

Lactobacillus MRS broth GM369 (direction: suspend 55.15 grams in 1000ml purified/distilled water) was collected from the lab under the surveillance of lab assistance.

According to the requirement, 8.265g MRS Broth was added to 125 ml (6 Plates) of distilled water in a conical flask.

After that, it was dissolved on a heating metal (around temperature 80 °C) by using a glass rod.

After that the conical flask containing the medium is properly locked by using a sterilized cotton plug.

For sterilization, MRS broth was kept in an Autoclave at a temperature of 121 °C, 15psi for 15 minutes.

The autoclaved medium was cooled down to room temperature.

Finally, 2.14ml of Antifungal (Luliconazole) was aseptically added to the prepared MRS medium.

- **Microbial Culture and Media**

Lyophilized *Lactobacillus acidophilus* LA-5 was used as a culture of probiotic strain for this study. Using the serial dilution method, we diluted 0.5g of *Lactobacillus acidophilus* LA-5 capsule in saline water. After completing the serial dilution, we can plate a small volume of each dilution onto already prepared MRS agar plates using pour plate techniques. This allows us to count the number of colonies that grow on each plate and calculate the original concentration of bacteria in the sample—incubated the agar plates at 37 °C for 24 hours and conditions to allow bacterial growth. After incubation, we performed

microbiological and biochemical tests to determine whether the grown species was *Lactobacillus acidophilus* or not. *Lactobacillus acidophilus* LA-5 (in the form of lyophilized capsules) used in this study was procured from Zydus Healthcare Limited, Kumrek, Sikkim, India.

Formulation of Whey-Fruit Juices Blended Beverages

Whey-fruit juices blended beverages were prepared by the selection of three fruits, they are – Cucumber (*Cucumis sativus*), Muskmelon (*Cucumis melo*), and White pumpkin (*Benincasa hispida*).

- **Procedure for Preparation of Whey**

Whey was made using a slightly modified Manasi et al. (2013) technique. After being heated to 95°C, pasteurized milk was cooled to 70°C. After constantly adding one percent citric acid (lemon juice) to the milk and whisking, the casein, the milk protein (Whey), was completely coagulated. A double-layered muslin cloth filter was used to filter the liquid (whey). Before combining with fruit juice, the whey that was obtained was cooked to 85 °C.

- **Procedure for Preparation of Fruit Juices**

Fresh fruits such as white pumpkin, muskmelon, and cucumber were procured from the Salem local markets. Dust and debris were eliminated from the fruits by carefully sorting and washing them under running water. Fruits were peeled, the seeds were taken out, and the flesh was sliced. A Preethi Zodiac juice blender was used to create the juices, and each fruit juice was given its filter before being stored in a clean, labeled container.

- **Preparation of Formulated Whey-Fruit Juices**

The juices of cucumber, muskmelon, and white pumpkin with whey water were formulated (mixed) in five different combinations with 1% Brown sugar (Cucumber: Muskmelon: White pumpkin: Whey water i.e. 25:25:25:25, 30:20:20:20, 20:30:20:20, 20:20:30:20, 20:20:20:30) and 1% Stevia using (Cucumber: Muskmelon: White pumpkin: Whey water i.e. 25:25:25:25, 30:20:20:20, 20:30:20:20, 20:20:30:20, 20:20:20:30) using measuring cylinder. Five sterilized transparent cups (150ml) contained 50ml formulated juice (different ratios) in each cup.

Pasteurization

All the different cucumber-muskmelon-white pumpkin and Whey water Juices were subjected to pasteurization at a temperature of 80 °C for 15 mins. All the glass bottles

containing juice samples were kept in a scale water bath maintained at the required temperature. Thereafter, when the desired temperature of juice was achieved, it was held at that temperature for the desired time duration. Then the pasteurized juice samples were evaluated for sensory, physico-chemical, and microbial analysis.

Sensory Evaluation and Selection of Highly Acceptable Blends

Organoleptic evaluation for the developed whey-fruit juices blended beverages was done by 20 members of teaching staff and students of the Department of Food Science and Nutrition, Periyar University, Salem using a 9-point hedonic scale (Ranadheera et al. 2012). An organoleptic evaluation was done at the Advanced Instrumentation Laboratory, Department of Food Science and Nutrition, Periyar University, Salem. Using a 9-point hedonic scale, participants were asked to rate the ten beverage formulations according to their overall preference, color, aroma, appearance, flavor, and mouthfeel/texture: Dislike = 1, dislike = much; dislike = 2, dislike = moderate; dislike = 4, neither like nor detest; like slightly = 6, like moderately = 7, like much = 8, and like strongly = 9.

Formulation of Probiotic Beverages

The results of sensory evaluation of whey-fruit juices blended beverages were considered for the selection of preparation of probiotic beverages. Thus, highly acceptable beverages with higher sensorial scores were used for the development of probiotic beverages. Based on the overall acceptability scores, 1% Brown sugar of Cucumber: Muskmelon: White pumpkin: Whey water 20:30:20:20 was highly accepted and was selected for the development of a probiotic beverage. The selected beverage was prepared and inoculated with a 1% probiotic starter culture (in the form of Capsules) containing *Lactobacillus acidophilus*. The probiotic beverage was stored in sterilized glass bottles under refrigeration conditions.

Physico-chemical analysis of Cucumber-muskmelon-white pumpkin with Whey based Probiotic beverage

Analysis of whey-fruit juice and probiotic beverage was carried out periodically throughout the storage period based on different physicochemical parameters such as pH, total soluble solids, and titratable acidity.

- **Acidity**

Using a digital pH meter, the pH of the fresh juices and probiotic beverages was measured according to the procedure outlined by Rathore et al (2012). First, at room temperature, buffers with pH values of 4.0 and 7.0 were used to calibrate the pH meter. The sample was collected into a 100 ml beaker, shaken, and then the beverage was added to the electrode of a pH meter. Once the pH meter stabilized, a reading was taken.

- **Titratable Acidity**

Using Phenolphthalein, the Titratable Acidity of the fresh juices and probiotic beverages was measured according to the procedure outlined by Angelov (2006). In a suitable container at room temperature, the sample was weighed 10 ml of the sample, added 300 mL of clean water, and thoroughly mixed. Then Bring it to a boil on a hot plate or over an open flame for approximately 15 minutes, stirring occasionally, and boil for 10 minutes. Remove from the heat source, add 1 mL of phenolphthalein indicator, and titrate immediately with standard 0.1 N sodium hydroxide solution to the first permanent pink color. Once the pink color turned, a reading was taken.

$$\text{Acidity} = \frac{\text{mL of 0.1 N NaOH}}{10 \text{ g} \times 10}$$

- **Total Soluble Solids (TSS)**

Utilizing a hand refractometer and the formula "Brix," the total soluble solids were calculated using the technique outlined by Shah (2010). After the juices were filtered, the TSS of the juices was determined using one of the lowest Brix ranges, 0-32°. On the prism glass surface of the refractometer, place a drop of fresh juices and probiotic beverages, carefully cover it with the lid, and check the TSS against the light.

Proximate analysis of Cucumber-muskmelon-white pumpkin with Whey based Probiotic beverage

Beverage was analyzed for proximate composition; moisture, ash, protein, fat, fiber, and total carbohydrates according to their respective methods.

- **Ash**

Using a Muffle furnace, an Ash of Probiotic beverage was calculated using the technique outlined by AOAC Official Method 942.05, Palachum (2010).

$$\text{Ash content (\%)} = \frac{(Z - X / Y - X) \times 100}{1}$$

Weight of empty crucible - X g

Weight of crucible + sample - Y g

After complete ashing, the Weight of the crucible + ash - Z g

- **Moisture content**

Using method No. 44-15 A of (A.O.A.C, 2000), Shendage (2020), the moisture content of Probiotic beverage was determined. In a hot air oven at 100°C, a sample of 5ml was dried to a constant weight in a tarred crucible. Using the formula below, we calculated the moisture content.

$$\text{Moisture (\%)} = \frac{(W1 - W2) \times 100}{W1}$$

Where: W1 = weight (g) of sample before drying

W2 = weight (g) of sample after drying

- **Fat**

Using a Soxhlet extraction, the Fat of the Probiotic beverage was calculated as described in method No. 30-10 (A.A.C.C., 2000), Shendage (2020). 2 ml of the probiotic drink was taken in a thimble and placed in the extraction tube of the Soxhlet apparatus. About 250 mL of hexane was added to the 500 mL bottom flask of the apparatus and connected to the Soxhlet apparatus. The fat was extracted by pouring hexane onto the sample at a rate of 3-4 drops per second for about 5 hours. The solvent was collected and the bottle was kept in a hot air oven at 40-50 ° C for 10 minutes. A desiccator was used to cool the flask, and then it was weighed. Fat percentage was calculated according to the following formula.

$$\text{Crude Fat \%} = \frac{(W2 - W1) \times 100}{S}$$

Weight of empty Soxhlet beaker (g) = W1

Weight of Soxhlet beaker and extracted fat (g) = W2

Weight of sample = S

- **Crude Fiber**

Based on method No. 32-10 (A.O.A.C., 2000), Shendage (2020), the crude fiber content was determined. A 2 ml sample that was devoid of fat and moisture was obtained and put into a 1000 ml beaker. To the beaker, 200 ml of 1.25% H₂SO₄ solution was added. The sample

was then boiled for 30 minutes to aid with digestion. After that, it was filtered using a suction device. Hot water was used to wash the residue until it was clear of acid. After that, the residue was once more moved to a 1000 ml beaker and cooked for 30 minutes in a 200 ml solution of 1.25% H₂SO₄. After filtering it once again, the residue was put in a crucible that had been previously weighed, and it was dried for 24 hours at 100° C in an oven to get a consistent weight. After that, the dry residue was burned on a burner and heated to between 550 and 600° C in a muffle furnace. Crude fiber in the sample is represented by the loss in weight during incineration.

- **Protein**

Using Kjeldhal's method, the Protein of Probiotic beverage was calculated using the method No. 46-10 of (A.A.C.C., 2000), Shendage (2020). It is based on the fact that organic compounds are oxidized by concentrated sulphuric acid and catalysts, and nitrogen is converted into ammonium sulfate in the process. Ammonia is liberated from the reaction mixture by making it alkaline, removing it by steam distillation, collecting it, and titrating it.

Procedure

Using the micro-Kjeldhal method, nitrogen content was determined in the samples. The sample was first digested in a digestion flask with H₂SO₄ in the presence of the soup mixture for 3-4 hours until the contents of the soup flask acquired a transparent color. The samples were then diluted to a volume of 250 ml with distilled water in a volumetric flask. Ammonia was distilled from the samples after the addition of 40% NaOH solution and collected in a flask containing 4% boric acid solution using methyl red as an indicator. The nitrogen content of the samples was determined by titration with a standard solution of 0.1 N H₂SO₄ and the percentage of crude protein was calculated using the following formula

$$(\text{ml HCl}_{\text{sample}} - \text{ml HCl}_{\text{blank}}) \times \text{Con HCl} \times 14.01 \times 100$$

$$\text{Calculation Of \% Of Nitrogen} = \frac{\hspace{10cm}}{1000 \times \text{Weight of sample (g)}}$$

- **Carbohydrates**

According to the difference method, Shendage (2020), carbohydrates were calculated as follows.

$$\% \text{carbohydrates} = 100 - (\% \text{moisture} + \% \text{protein} + \% \text{Fat} + \% \text{Ash})$$

Shelf-Life Study

- **Effect of storage on the viability of probiotics**

All the beverages developed were subjected to shelf-life studies. The whey-fruit juice-based drinks were packaged in glass bottles that were sealed with cotton plugs. The glass bottles were kept at a temperature of 2-4°C for 56 days. Functional properties and cell count analysis were performed on the packaged beverages regularly at the 0th, 7th, 14th, 21st, 28th, 35th, 42nd, 49th, and 56th days. For the estimation of bacterial populations in various samples, a dilution plate approach was used according to Harrigan (2014).

Preparation of dilutions

1 ml sample was carefully mixed with 9 ml of sterile salt water. From this 1 ml sample was transferred via sterile pipette to another tube containing sterile salt water for a 10-2 dilution. Similar dilutions were prepared for 10-3 and 10-4.

Preparation of plates

The contents of the dilution tube were thoroughly mixed by suction and one ml of the dilution was transferred into a sterile petri dish. On each petri plate with the diluted sample 10 ml of molten MRS agar was added to 45 °C and thoroughly mixed with the suspension. The plates were set to 37 °C and incubated for 24-48 hours.

$$\text{CFU(ml)} = \frac{\text{Number of colonies} \times \text{dilution}}{\text{Volume of culture-plated}}$$

- **Effect of storage on physicochemical properties of Probiotic Beverage**

The cucumber-muskmelon-white pumpkin with whey juice was kept in the refrigerator at 4°C for 56 days. Probiotic beverage's physicochemical properties including pH, Total soluble solid (TSS), and Titratable acidity were assessed at weekly intervals to study the effect of storage temperature on microbial metabolism.

Figure 1: Growth of probiotic strain on MRS-agar plate

RESULTS AND DISCUSSION

The present investigation “Formulation and Shelf-Life Study of a Whey-based Probiotic Functional Beverage” was conducted to formulate fruit juice- whey blended beverages with varying proportions of whey to fruit juices and the best acceptable formulations were evaluated. The results obtained are presented in this chapter under the following headings.

Physicochemical properties of preparation of fruit juice

The fruit juice was prepared by using the filtration method. The Physicochemical Properties such as Fruit weight, Peel (%), pulp weight, and Juice content (%) of Cucumber (*Cucumis sativus*), muskmelon (*Cucumis melo*), and White pumpkin (*Benincasa hispida*) were measured and calculated. The Physicochemical properties of the preparation of fruit juice as shown in Table 1,

Table 1: Physiochemical Properties of fruit juices

S. No	Properties	<i>Cucumis sativus</i>	<i>Benincasa hispida</i>	<i>Cucumis melo</i>
		Values		

1	Fruit weight(g)	525g	1772g	560g
2	Peel (%)	9.41	17.64	16.72
3	Juice content (%)	25.11	44.81	16.90
4	Pulp weight	63.48	35.55	64.38

Different Blends of Whey-Fruit Juices

The juices of cucumber, muskmelon, and white pumpkin with whey water were formulated (mixed) in five different combinations. The Different Blends of Whey-Fruit Juices are shown in Table 2,

Table 2 : Different Blends of Whey-Fruit Juices

Blends	Sweeteners	Cucumber (%)	Muskmelon (%)	White pumpkin (%)	Whey water (%)
B1	1% Brown Sugar	25	25	25	25
B2		30	20	20	20
B3		20	30	20	20
B4		20	20	30	20
B5		20	20	20	30
S1	1% Stevia	25	25	25	25
S2		30	20	20	20
S3		20	30	20	20
S4		20	20	30	20
S5		20	20	20	30

Organoleptic Evaluation of Whey-Fruit Juices

The formulated cucumber-muskmelon-white pumpkin and Whey water fermented juice was analyzed for sensory evaluation for various characteristics such as appearance, aroma, flavors, taste, texture, and overall acceptability. The evaluators were instructed to document

their findings on a sensory data sheet using a 9-Hedonic scale. The Organoleptic Evaluation of Whey-Fruit Juices is shown in Table 3,

Table 3 : Organoleptic Evaluation of Whey-Fruit Juices

Organoleptic characteristics	Mean scores of organoleptic evaluations					
	Evaluator					
	Names					
	Nagarani	Sangeetha	Gomathi	Sanjay	Pradeepa	Mean
B1	7.92±0.84	6.92±1.22	6.84±0.75	6.56±1.61	6.08±0.81	6.86

S5	7.12±1.15	6.50±0.80	6.45±0.76	6.42±0.88	6.15±0.56	6.52

Note: Values are expressed as mean ± SD

Among all the combinations of substrates, a B3 (Cucumber: Muskmelon: White pumpkin: Whey with 1%jaggery (20:30:20:20)) ratio juice sample was accepted for the study of research work due to its suitability for various characteristics such as appearance, aroma, flavor, taste, texture, and overall acceptability.

Functional Characteristics of Whey-Fruit Juices and Probiotic Beverages

Functional characteristics of whey fruit juice blended beverages namely Acidity (pH), Titrable Acidity, and Total Soluble Solids were carried out weekly throughout the storage period and are shown in Figures 4.1 to 4.6.

- Effect of pH during Storage of Whey-Fruit Juices and Probiotic Beverages**

The pH of fresh juice decreased by 36.11% and Probiotic juice decreased by 38.66% from the initial day to the 56th day. The pH values of both fresh juice and probiotic juice are given below,

Table 4 : Changes in pH of Probiotic Juice W.R.T. Fresh Juice

Storage Period (days)	pH	
	FJ	PJ
0	6.23±0.0067	6.13±0.0012
7	6.18±0.0032	5.98±0.0009

- Proximate analysis of Cucumber-muskmelon-white pumpkin with Whey based Probiotic beverage**

The Chemical properties such as Protein, Fat, Crude fiber, Carbohydrates, Moisture content, and Ash of Cucumber-muskmelon-white pumpkin with a Whey-based Probiotic beverage were calculated. The values are given below,

Table 7 : Proximate analysis of Whey based Probiotic beverage

S. No	Chemical properties (%)	<i>Cucumis sativus</i>	<i>Benincasa hispida</i>	<i>Cucumis melo</i>
1	Moisture	86.74	90.33	84.35
2	Fat	0.54	0.33	0.49
3	Protein	3.46	2.97	0.36
4	Total Carbohydrates	9.0	6.07	14.51
5	Ash	0.26	0.30	0.29

- * Each value is an average of three determinations.
- **Evaluation of the Shelf-Life Qualities of the Beverages**

Figure 4 shows the microbial count of whey fruit juice blended beverages. The bacterial load for the stored beverages revealed that, as the storage period proceeds the cell count was decreased. The bacterial count of beverages reached 8.07×10^8 under refrigerated conditions.

Table 8 : Probiotic Viability of Whey Fruit Juice Blended Beverages

Storage period (days)	Probiotic Viability	FSSAI Specification (2017)
	Probiotic Juice	
0	10.23±0.1212	Probiotic viability should be above 8 log CFU/ml
7	10.02±0.0954	
14	9.87±0.0342	
21	9.75±0.0097

35	8.76±0.0021	
42	8.54±0.0012	
49	8.33±0.0076	
56	8.07±0.1004	

To avoid contamination, the product has been heat treated to kill most microbes and packaged in pre-sterilized glass bottles. However, milk-based drinks still had their microflora that grew during storage. In addition, whey contains lactose sugar and proteins that promote the growth of microorganisms during storage.

In this study, probiotic whey-fruit juices blended beverages were within acceptable probiotic count limits (less than 10^8 colony-forming units per ml) to be considered therapeutic beverages. Based on the present study, the beverage can be stored and consumed safely for 56 days.

Figure 4 : Probiotic viability of whey-fruit probiotic beverage during storage

According to Ranadheeran et al. (2010) sugars, proteins, and fat content are some of the factors that can affect the growth and survival of probiotics in food. Thus, the observed increase was due to the higher concentration of the substrate (sucrose) during the storage period.

Figure 4 shows the number of probiotics in probiotic whey drinks when stored at 2-4°C. The initial bacterial count of the drink was 10.23 cfu/ml. Bacterial counts were observed to decrease mainly until day 14, followed by a decrease in the storage time.

Marek et al. (2017) said that the difference in the survival rate of probiotic bacteria in fruit or milk fruit drinks depends on the fruit species, strain type, and storage time. The optimum pH for the growth of probiotic bacteria is between 6.5 and 4.5, and at values below 4, their growth is usually inhibited.

All probiotic whey-juice mixed drinks prepared in the study were in the acceptable range of probiotic content (less than 10⁹ cfu/ml) to be considered therapeutic over-the-shelf drinks. According to this study, the drinks can be safely stored and consumed for about 56 days.

CONCLUSION

The present investigation focuses on the development of a probiotic beverage that imposes potential health benefits of Cucumber (*Cucumis sativus*), Muskmelon (*Cucumis melo*), and White pumpkin (*Benincasa hispida*) with whey. To achieve this, the probiotic culture of *L. acidophilus* was used as a starter culture for the fermentation of beverages for the preparation of a functional food. The juice was extracted by formulating cucumber,

muskmelon, and white pumpkin juice with whey together at different ratios (i.e. 25:25:25:25, 30:20:20:20, 20:30:20:20, 20:20:30:20, 20:20:20:30) with 1% Brown sugar. Several factors such as pH, TSS, TA, Ash, Protein, Fat, Fiber, Moisture, and Carbohydrates were optimized. Required viable cell count i.e. $\geq 8 \log \text{CFU/ml}$, pH in the range of 3.9-6.2 was found with 1% culture inoculum after 24 h of incubation period at 37 °C. Cell viability was found to decrease during cold storage at 4 °C for 56 days.

So, one of the future health drinks could be a ready-made probiotic drink. The growing interest in dairy-free probiotic products is driven by the growing vegan lifestyle trend, lactose intolerance issues, and the demand for low-fat, low-cholesterol diets. Thus, a probiotic drink made from cucumber, muskmelon, and pumpkin with whey can be easily marketed to appeal to consumers of all ages. In conclusion, the processing technology of cucumber, muskmelon, and pumpkin-based probiotic drinks with whey juice is technoeconomically feasible and therefore commercially applicable. It is also useful for the user because it has nutritional and medicinal properties.

ACKNOWLEDGMENT

At the outset, I bow my head in gratitude before God, the gracious, compassionate, the most merciful who alone is the lighthouse of my life and source of my inspiration. I am indebted to my supervisor Dr. NIRMALA C, Head of Department, Department of Biotechnology at Pavai College of Technology whose inspiration, encouragement, invaluable suggestions, and courteous behavior have made the completion of my thesis possible. I am pleased to avail myself of this opportunity to acknowledge my heartfelt thanks to the Management and Principal Dr. M. PREMKUMAR, of Pavai College of Technology, Namakkal. My genuine thanks and gratitude to Dr. T. POONGODI VIJAYAKUMAR, Professor & Head, and MRS. A. NAGARANI, Food Analyst, Department of Food Science and Nutrition, of Periyar University, Salem for their unstinting support and suggestions made during the preparation of this study.

ABSTRACT

Natural goods are an abundant supply of commercial products for the pharmaceutical and other sectors, in addition to their significant significance in fundamental biological and chemical research. Given that the majority of commercial drugs derived from natural products (about 58%) require synthetic efforts to either enable cost-effective access to bulk material or to optimize drug properties through structural modifications, industrial natural product chemistry is fundamentally important for successful product development. The purpose of this paper is to highlight problems with the lead-to-product route and demonstrate how contemporary natural product chemistry has successfully solved them. It focuses on natural items that are relevant today and are used as medications or are meant to be used as such pharmaceuticals. *Dioscorea oppositifolia* has received the species name because of the apparent opposite leaves that are often visible on older vines; other yam species, such as the turtle plant, are usually alternately leafed. The most commonly observed therapeutic values of *Dioscorea oppositifolia* such that the juice of rhizome is taken to reduce the complications related to menopause, the tuber decoction is used for early menstruation, the decoction of the tuber is used as a birth control agent and to reduce obesity. the methanol extract of *Dioscorea oppositifolia* possesses significant phytochemical constituents and therefore has potent antioxidant and anticancer activity. Phytochemical analysis of the methanol extract of *Dioscorea oppositifolia* leaves showed the presence of Alkaloids, Flavonoids, Phenols, Terpenoids, steroids, tannin and carbohydrates. The hexane extract of

Dioscorea oppositifolia leaves showed the presence of only flavonoids, terpenoids, carbohydrates, oils, and resins. Carbohydrates were present in both the extracts of *Dioscorea oppositifolia*. The DPPH assay is carried out in different concentrations such as 50, 250, 500, 750, and 1000 µg/ml. The percentage Inhibition concentration was 37.50, 42.36, 48.61, 54.86 and 59.03. The inhibition concentration of fifty percent lies in 576.58 µg/ml. The in vitro anticancer activity of the Methanol extract of *Dioscorea oppositifolia* was studied using the MCF-7 cell line. The % Cytotoxicity was found to be directly proportional to the concentration of the methanol extract of *Dioscorea oppositifolia*. The CTC50 was found to be 689.89 µg/ml. Therefore, the methanol extract of *Dioscorea oppositifolia* has potent anticancer activity.

OBJECTIVE OF THE STUDY

To perform qualitative analysis of phytochemicals, present in different solvent (Methanol and Hexane) extracts of *Dioscorea oppositifolia*.

To determine the In vitro antioxidant activity of *Dioscorea oppositifolia* extracts by DPPH assay.

To study the in vitro anti-cancer properties of *Dioscorea oppositifolia* extracts by MTT cell line by MCF- 7 (Human Breast Cancer cell line).

Keywords

ABSTRACT

The genus *Jacaranda* is a significant representative of the tribe Tecomeae in the family Bignoniaceae. The aim of the present study is to carry out a phytochemical screening and evaluate antioxidant, antimicrobial, and anti-inflammatory activities of *Jacaranda mimosifolia* crude extracts. The analysis exhibited the presence of compounds such as glycosides, carbohydrates, amino acids, proteins, tannins, terpenoids, fats and oils. The antioxidant activity of methanolic extract was evaluated by DPPH and ABTS scavenging assays and the IC₅₀ values are 12.957 M/ μ L and 144.231 M/ μ L respectively. It showed effective antimicrobial activity against *E. coli*, *P. aeruginosa*, *S. mutans* and *S. typhi* in four different concentrations. In addition, the extract was evaluated for the anti-inflammatory activity using Bovine Serum Albumin denaturation assay and the IC₅₀ value was 213.85 M/ μ L. According to the findings, it is evident that extracts of its seed could be a viable substitute for synthetic antioxidant, antimicrobial, and anti-inflammatory drugs.

Keywords

Jacaranda mimosifolia, Phytochemicals, Antioxidant, Antimicrobial, and Anti-Inflammatory.

Graphical Abstract

Introduction

Natural compound based research on ethnopharmacological data has made major contributions to drug improvement and cleared the path for novel pharmacological instruments (Bonito et al. 2011; Maione et al. 2013). Natural medicinal items are employed all over the world because of the severe negative effects of chemical drugs. Medicinal plants are frequently used for their low cost and widespread availability. Due to the growing adoption of herbal healthcare practises, they have recently become more significant since they have a variety of pharmacological effects because they contain bioactive chemicals. (Bernela et al., 2023). Muhammad et al. 2015).

According to the World Health Organisation (WHO), for a variety of diseases, approximately 80% of the global population uses plant-based medications (Sen and Chakraborty, 2017). The World Health Organisation devised and launched the 'WHO Traditional Medicine Strategy 2014-2023' in 2013, emphasising the need of integrating traditional and complementary medicine to promote universal healthcare and ensure the quality, safety, and effectiveness of such treatment. The side effects, misuses or overuse of allopathic drugs are also a major concern. As a result, the world is looking for cost-effective, easily accessible, better physiologically compatible traditional systems of medicine and

holistic approaches to address this issue and provide basic healthcare to all (WHO, 2013, Geneva).

Jacaranda is a member of the dicot family Bignoniaceae Juss., which includes endemic plants from South America that are found in tropical places around the world (Sanchez, 2011). It is native to Brazil and has been cultivated in both tropical and subtropical sections of the world, as well as naturalised in many nations, for its attractive frond and blossom (Zaghloul et al. 2011), apart from that it is using for floriculture. It is a tree that grows from 1 to 45 metres tall and has blue blooms that are up to 5 cm long and arranged in 30 cm panicles in the summer. This species' fruits are oblong capsules, flattened perpendicular to the septum, with glabrous or lepidote valves and many seeds. The genus of Jacaranda is commonly known as pioneer trees, because the seeds are easily grown in different climates (Gachet et al. 2010). Some members of this family have been used in traditional medicine for wound healing, rheumatism, and colds. Furthermore, anti-malaria and antibacterial properties have been demonstrated by Khamsan (2012).

Pharmacological studies have showed that this genus contains antioxidant (Aguirre-Becerra et al., 2020), antimicrobial (Yuan et al., 2018), anti-inflammatory (Santos et al., 2012) and anticancer activities (Mostafa et al., 2016). This context invigorates the evaluation of the biological activities of seeds of *Jacaranda mimosifolia*. The main objective of the present study is to evaluate methanolic extracts of its seed regarding the phytochemical profile and pharmacological activities such as antioxidant, antimicrobial, and anti-inflammatory activity. To our knowledge, no previous research has been conducted for an evaluation of those activities evaluated in the current work using its seed.

Materials and Methods

Collection of Plant Materials

Seeds of *Jacaranda mimosifolia*, with no apparent physical, insect or microbial damage were collected from Pathanamthitta, Kerala.

Processing of Plant Materials

1g of clean seed is crushed using motor and pestle, to provide a greater surface area.

Extract preparation

The crushed plant material made into a liquid form using 10mL methanol. It is then transferred into a conical flask and keep it overnight in shaking incubator in order to make cold methanol extract.

Crude sample extract was prepared by Soxhlet extraction method (Redfern et al., 2014).

Phytochemical Screening

Phytochemical Screening Test for Alkaloids (Wagner's reagent)

A fraction of extracts was treated with 3-5 drops of Wagner's reagent [1.27g of iodine and 2g of potassium iodide in 100ml of water] and observed for the formation of reddish brown precipitate (or colouration).

Test for Carbohydrates (Molisch's test)

Few drops of Molisch's reagent were added to 2ml portion of the extracts. This was followed by addition of 2ml of conc. H₂SO₄ down the side of the test tube. The mixture was then allowed to stand for two-three minutes. Formation of a red or dull violet colour at the interphase of the two layers was a positive test.

Test for Cardiac glycosides (Keller Kelliani's test)

5ml of extracts were treated with 2ml of glacial acetic acid in a test tube and a drop of ferric chloride solution was added to it. This was carefully underlayered with 1ml concentrated sulphuric acid. A brown ring at the interface indicated the presence of deoxysugar characteristic of cardenolides. A violet ring may appear below the ring while in the acetic acid layer, a greenish ring may form.

Test for Flavonoids (Alkaline reagent test)

2ml of extracts were treated with few drops of 20% sodium hydroxide solution. Formation of intense yellow colour, which becomes colourless on addition of dilute hydrochloric acid, indicates the presence of flavonoids.

Test for Phenols (Ferric chloride test)

A fraction of the extracts was treated with aqueous 5% ferric chloride and observed for formation of deep blue or black colour.

Test for Phlobatannins (Precipitate test)

Deposition of a red precipitate when 2ml of extracts were boiled with 1ml of 1% aqueous hydrochloric acid was taken as evidence for the presence of phlobatannins.

Test for Amino acids and Proteins (1% ninhydrin solution in acetone).

2ml of filtrate was treated with 2-5 drops of ninhydrin solution placed in a boiling water bath for 1-2 minutes and observed for the formation of purple colour.

Test for Saponins (Foam test)

2ml of extracts were added to 6ml of water in a test tube. The mixture was shaken vigorously and observed for the formation of persistent foam that confirms the presence of saponins.

Test for Sterols (Liebermann-Burchard test)

1ml of both extracts were treated with drops of chloroform, acetic anhydride and conc. H₂SO₄ and observed for the formation of dark pink or red colour.

Test for Tannins (Braymer's test)

2ml of both extracts were treated with 10% alcoholic ferric chloride solution and observed for formation of blue or greenish colour solution.

Test for Terpenoids (Salkowki's test)

1ml of chloroform was added to 2ml of each extracts followed by a few drops of concentrated sulphuric acid. A reddish brown precipitate produced immediately indicated the presence of terpenoids.

Test for Quinines

A small amount of extracts was treated with concentrated HCL and observed for the formation of yellow precipitate (or colouration).

Test for Oxalate

To 3ml portion of extracts were added a few drops of ethanoic acid glacial. A greenish black colouration indicates presence of oxalates.

Test for Fats & fixed oils

To 5 drops of sample, 1ml of 1% Copper Sulphate solution and few drops of 10% Sodium Hydroxide was added (Ugochukwu et al., 2013).

Antioxidant activity test

In this study, the antioxidant activity of *J. mimosifolia* was measured using two different activities: 1) DPPH radical scavenging assay and 2) ABTS radical scavenging assay. Two free radicals that are commonly used to assess antioxidant activity in vitro are 2,2-azinobis (3-

ethylbenzothiazoline-6-sulfonic acid) (ABTS) and 2,2-diphenyl-1-picrylhydrazyl (DPPH). However, both of these radicals are foreign to biological systems.

DPPH method

DPPH antioxidant capacity (2,2-Diphenyl-1-picrylhydrazyl) was determined with the methodology described by Blois (1958). The absorbance was measured at 517 nm. The results were expressed as the percentage of inhibition based on the following formula:

% DPPH inhibition = $[(A. \text{ Control}) - (A. \text{ Sample}) / A. \text{ Control}] * 100$, where A. Control represents the absorbance of the DPPH solution and A. Sample represents the absorbance of the sample with DPPH solution.

ABTS method

ABTS (2,20-azino-bis-(3-ethyl benzothiazolin-6-ammonium sulphonate)) assay was performed according to the method described by (Re et al., 1999). It was measured at 734 nm. The results were expressed as the percentage inhibition of ABTS based on the following formula:

% ABTS inhibition = $[(A. \text{ Control}) - (A. \text{ Sample}) / A. \text{ Control}] * 100$ where A. Control represents the absorbance of the ABTS solution and A. Sample represents the absorbance of the sample with ABTS solution.

Antimicrobial activity test

The antibacterial activity of the extract was determined by Agar well diffusion assay (Reeves et al., 1989). In this well-known procedure, agar plates are inoculated with a standardized inoculum of the test microorganism. Then, filter paper discs (about 6 mm in diameter), containing the test compound at a desired concentration, are placed on the agar surface. The Petri dishes are incubated under suitable conditions. DMSO was used as negative control against the cell lines. Wells were made in the agar plates using aseptic techniques in order to add the *J. mimosifolia* seed extract. The petri dishes were then incubated at 37 C for 24 h, before measuring the zone of inhibition. Generally, antimicrobial agent diffuses into the agar and inhibits germination and growth of the test microorganism and then the diameters of inhibition growth zones are measured. The zone of inhibition was measured in millimeters (Hudzicki, 2009).

Anti-inflammatory activity test

Albumin denaturation assay was used as an indication of the antiinflammatory activity and it was evaluated by the method of Mizushima and Kobayashi (1968) and Sakat et al., (2010) with slight modification. 500 µL of 1% bovine serum albumin was added to 100 µL of plant extract. This mixture was kept at room temperature for 10 minutes, followed by heating at 51°C for 20 minutes. The resulting solution was cooled down to room temperature and absorbance was recorded at 660 nm. Diclofenac Sodium was taken as a positive control. The experiment was carried out in triplicates and percent inhibition for protein denaturation was calculated using:

$$\% \text{ Inhibition} = 100 - ((A1 - A2) / A0) * 100$$

Where A1 is the absorbance of the sample, A2 is the absorbance of the product control and A0 is the absorbance of the positive control.

Where A1 is the absorbance of the sample, A2 is the absorbance of the product control and A0 is the absorbance of the positive control.

Results and Discussion

Phytochemical tests

Secondary metabolism in plants is responsible for the manufacture of chemicals known as secondary metabolites, which are involved in non-essential processes such as stress tolerance, pollinator attraction, and plant-to-plant communication. Plants own various classes of secondary bioactive metabolites, including alkaloids, flavonoids, phenolics, and terpenes. Phenols are organic compounds with at least one phenolic group and an aromatic ring connected to a hydroxyl group (Li et al., 2016; Liu et al., 2016; Dai et al., 2020). Mostafa et al. (2014) identified different classes of phytochemicals as fatty acids, sterols and flavonoids in some *Jacaranda* species.

From phytochemical screening of *Jacaranda mimosifolia*, it is clear that the cold methanolic and soxhlet extracts gave negative results with test for Alkaloids using Wagner's reagent. With the Molish test, both extracts are observed for formation of red or violet colour at the interphase of two layers and which indicates the presence of carbohydrates. As a result of Keller Kelliani's test, in soxhlet extract, formation of brown ring at the interphase is observed and that indicates the presence of cardiac glycosides and it gave negative results

in cold methanol extract. With Alkaline reagent test, Ferric chloride test, Test for Quinines, Test for Oxalate and Precipitate test, both extracts showed negative results. Test for Amino acids and Proteins exhibited their presence as a result of the formation of purple colour. Foam test and Liebermann-Burchard test failed to show the presence of saponins and sterols. Braymer's test indicated the presence of tannins as they formed blue colour solution in soxhlet extract and it gave negative result in cold methanol extract. The test of terpenoids, gave positive result with cold extract only as it observed for the formation of yellow precipitate. With test for fats & oils, formation of clear blue solution was observed in Soxhlet extract and indicated its presence (Table 1).

Antioxidant activity

An agent that prevents the consumption of oxygen is referred to as an antioxidant. Natural antioxidants can function as free radical scavengers, pro-oxidant metal ion complexes, chain breakers, and regulators of singlet-oxygen production (Tosun et al., 2011). However, antioxidants also function as a metal chelating agent, an enzyme inhibitor, an electron giver, a hydrogen donor, a peroxide decomposer, a radical scavenger, and a synergist (Pham-Huy, et al., 2008). The reducing capacity of the extracts may be a better indicator for their potential antioxidant activity.

In this study, two commonly used antioxidant assay methods, including ABTS and DPPH radicals scavenging activity assays, were used to evaluate the antioxidant activity of the sample extract. One of the most popular colorimetric assays to estimate the radical scavenging capacity of plants and extracts is the 1,1-diphenyl-2-picrylhydrazyl (DPPH) assay (Badarinath, et al., 2010). The antioxidant activity of methanol extract of *Jacaranda mimosifolia* seeds were evaluated against the Gallic Acid in the volume ranging from 10 to 50 microlitres by DPPH radical scavenging assay is depicted (Figure 1) and observed that the IC₅₀ value of the sample (12.957 M/ μ L) is less than that of Gallic acid (79.7 M/ μ L) and the sample has highest antioxidant activity.

The ABTS assay measures the relative ability of antioxidants to scavenge the ABTS generated in aqueous phase. The ABTS radical cation (ABTS⁺) is commonly used to evaluate the total antioxidant activity of single compounds and complex mixtures. Figure 2 depicts the inhibitory effect of the sample in comparison with Gallic acid in the volume ranging from 100 to 500 microlitres by ABTS Assay. From the plot, it is evident that the IC₅₀ value of

Jacaranda mimosifolia (144.231 M/ μ L) is less than that of Gallic acid (174.813 M/ μ L) and therefore the sample exhibited highest antioxidant activity. This emphasises the influence of secondary metabolites presents in the methanol extracts of Jacaranda mimosifolia seeds antioxidant activity.

Phytochemical analysis has exhibited that phytochemicals such as tannins, terpenoids, volatile oils, and fats, have potential antioxidant activity (Ranabhat et al., 2022). Many researchers have become interested in medicinal plants in recent decades for the evaluation of antioxidant phytochemicals, which have garnered increased attention for their possible function in the prevention of human diseases (Upadhyay et al., 2010). The usages of the synthetic antioxidants are now replaced because the natural antioxidants could be considered as safer without any side effects (Meenakshi et al., 2011).

Antimicrobial Activity

To evaluate the antibacterial activity of methanol extract of *J. mimosifolia* seeds, gram-negative organisms such as *E. coli*, *P. aeruginosa*, *S. typhi*, and gram-positive bacterias such as *S. mutans*, *B. cereus*, were selected. The sample extract demonstrated no activity (inhibition zone <10mm) against *B. cereus* and *S. aereus*. But it is effective against *E. coli*, *P. aeruginosa*, *S. mutans* and *S. typhi* in four different concentrations (Figure 3). To evaluate the antifungal activity of methanol extract of *Jacaranda mimosifolia* seeds, *A. niger* and *C. albicans* were selected and the sample demonstrated no activity against both the fungal strains. The negative control test with dimethyl sulfoxide did not inhibit the growth of the strains. These findings suggest that pathogenic bacterial growth is inhibited by

physiologically active secondary metabolites found in methanol extracts of *Jacaranda mimosifolia* seeds.

Foodborne infections are a significant cause of public health issues around the world, and natural products can be essential antimicrobial agents against these pathogens. There have been studies about the effect of *Jacaranda mimosifolia* extract to reduce various microbial counts. Many researches exhibited promising antimicrobial activities of these plants in pharmaceutical and food preservation systems. This activity may be due to the strong presence of polyphenolic compounds such as tannins and terpenoids. Tannins have been proven in studies to have anticarcinogenic, antimutagenic, and antibacterial effects (Hong et al., 2011). The inclusion of tannins in the extract may explain its powerful bioactivities, as tannins have been shown to have potent antibacterial activity. Batool et al. (2018) also investigated effect of phytochemical compounds, such as alkaloids, polyphenolic compounds, gallic acid, glycosides, tannic acid, flavonoids and sterols on the inhibition of *L. monocytogenes*.

Figure 3: d) Antibacterial activity of *S. typhi*

Anti-inflammatory activity

Protein denaturation is a well-researched contributor to inflammation and it is the main cause of inflammation (Reshma et al., 2014). In order to further understand the mechanism underlying the anti-inflammatory effects, the potential of the extract to prevent protein denaturation was examined. The results showed inhibition of Bovine Serum Albumin denaturation dependent on the concentration of extract. The soxhlet extract was used with volume ranging from 100 to 500 microlitres, the percentage inhibition increased with increase in concentration. Diclofenac sodium was used as a reference drug which also showed inhibition of concentration-dependent protein denaturation. The Anti-inflammatory activity of the sample against diclofenac sodium is shown in Figure 3. From the observation, it is found that the IC₅₀ value of the sample is 213.85 M/ μ L and that of diclofenac sodium is 158.305 M/ μ L.

Zaghloul et al. (2011) reported that the leaves and bark of *J. mimosifolia* D. Don have been used in traditional medicine in Brazil, Ecuador, and Argentina to treat blood purification and sexually transmitted disease. Several natural extracts with established anti-inflammatory properties have been identified through investigations employing in vitro and in vivo models of inflammation over the last decade (Orlikova et al. 2014). Sultana & Saify (2012) reviewed to assemble pertinent data on the mechanism of action of terpenes derived from active ethnomedicinal plants to investigate the role of terpenoids in medicinal plants used to treat inflammatory illnesses, particularly those involving an immune response. So, occurrence of tannins and terpenoids may be the reason for the anti-inflammatory property of the extract.

Figure 4: b) BSA Denaturation Assay: Turbidity of the Diclofenac Sodium

Conclusion

Plants contain several secondary metabolites, which has diverse pharmacological activities in human beings. Jacaranda mimosifolia seeds represent a source of biologically active compounds such as glycosides, carbohydrates, amino acids, proteins, tannins, terpenoids, fats and oils., therefore exhibited strong in-vitro antioxidant and anti-inflammatory activity. Furthermore, the extract showed antimicrobial activity against E. coli, P. aeruginosa, S. mutans and S. typhi in four different concentrations. These findings of current study provide scientific evidence to support further investigation into the uses of the

its seeds as a natural substitute for synthetic antioxidant, antibacterial and anti-inflammatory drugs.

Introduction

Naringin is a flavanone glycoside molecule found in grapes and citrus fruits. It has a unique bitter flavour equivalent to grape juice and has a substantial antioxidant potential and they are recognised for their positive impact on human health (Ghanbari et al., 2021) (Yang et al., 2022). It is a reasonably safe, nontoxic bioactive molecule (Bai et al., 2020). The molecular weight of naringin is 80.4 g/mol. Its chemical name is 4',5,7-trihydroxyflavonone-7-rhamnoglucoside and the molecular formula is C₂₇H₃₂O₁₄. Grapes and citrus fruits have the highest levels of the flavonoid naringin. It has a conventional flavanoid structure with three rings (two of which are benzene rings), joined by a three-carbon chain, and two rhamnose units attached at the C7 (Memariani et al., 2021) (Barreca et al., 2017). It possesses extraordinary biological and pharmacological effects. However, Because of a lack of strong clinical data, the therapeutic applications of these flavonoids are severely restricted. Naringin protects against cancer and suppresses proliferative processes; consequently, it has promising therapeutic potential for usage as effective alternative treatments for oncological patients. This molecule could be employed as adjuvant therapies because of its ability to overcome resistance to conventional chemotherapy and boost the efficacy of chemotherapeutic drugs (Hossain et al., 2022).

Pharmacological activities of Naringin

The consumption of flavonoids found in citrus fruits has been linked to a lower prevalence of endothelial cell dysfunction. Naringin, an important flavonoid derived from grapefruit, tomatoes, and oranges, display anti-inflammatory, antioxidant, and cell survival

actions that help the vascular endothelium (Adetunji et al., 2023). Naringin has a wide range of pharmacological activities, including antioxidant, anti-diabetic, anti-carcinogenic, anti-ulcer, anti-mutation and anti-osteoporotic characteristics (Yadang et al., 2020). Herbal medications have also been utilised for many years to treat Alzheimer's disease. Naringin is one of such major phyto molecule. It demonstrated promising outcomes against Alzheimer's disease (Dashputre et al., 2023). It has been found to exhibit a broad variety of pharmacological and therapeutic activities, including lipid-lowering, antioxidant, free radical-scavenging, anti-fibrosis, antitussive, anti-osteoporosis and anti-obesity effects.

It has recently been experimentally proved to relieve several ailments, including inflammation, neurodegeneration, cardiovascular problems, metabolic syndrome, and respiratory diseases (Shi et al., 2017). Moreover, a novel naringin and naringenin-rich dietary source citrus bergamia (bergamot) and other citrus fruits have lately been explored for lipid-lowering benefits in animal models and human clinical trials (Yang et al., 2022). Also Naringin could reduce DBP-induced testicular damage and spermatogenesis impairment, pointing to the possibility of using it as a natural protective and therapeutic agent for alleviating reproductive dysfunctions and improving reproductive performance, owing to its potent antioxidant activity.

Furthermore, Ahmed et al. (2019) ascribed the protective impact of naringin to the improvement of antioxidant defence system and the reduction of inflammation and apoptotic pathways. Some investigations also hypothesised a molecular explanation for its antioxidant impact in enhancing testicular function and structure.

Mechanism of action of Naringin

Naringin is a dietary bioflavonoid that is digested and hydrolyzed by intestinal microorganisms to produce a highly absorbed derivative, naringenin. In humans, naringin is poorly absorbed by the gastrointestinal tract and epithelial cells of the oral cavity and small intestine, and intestinal bacteria typically convert it to its aglycone form, naringenin. Naringin has an oral bioavailability of around 5-9% (Zeng et al., 2020). Naringin and naringenin can be found in the lungs, trachea, gastrointestinal tract, liver, and kidneys (Zeng et al., 2019). Both phyto compounds are processed in phase I (oxidation or demethylation by cytochrome P450 monooxygenases) and phase II (glucuronidation, sulfation, or

methylation) in intestinal and liver cells, respectively (Yang et al., 2022). The majority of metabolites are excreted through urine; however, some are also identified in faeces.

Clinical applications of Naringin as an anticancer agent

Naringin has the capacity to decrease inflammation, promote apoptosis, and inhibit proliferation, angiogenesis, metastasis, and invasion. These properties demonstrate that they have a significant potential to become new and safe anticancer treatments (Stabrauskiene et al., 2022). Their anti-carcinogenic properties have been demonstrated to function via many cell signal transduction pathways. Recently, different pharmacological techniques based on combination therapy, integrating naringin with the current anticancer drugs, have shown spectacular synergistic results when compared to monotherapy (Memariani et al., 2021). It is also reported that naringin can reduce cancer medication resistance, which is one of the most significant hurdles to clinical treatment because of various defence mechanisms in cancer (Tungmunthum et al., 2018). It also has anticancer effects by inhibiting GSK3 β , downregulating intracellular adhesion molecules-1, suppressing NF- κ B and COX-2 gene and protein activation, upregulating Notch1 and tyrosine-specific genes, downregulating JAK2/STAT3 and activating caspase-3 and p38/MAPK (Rauf et al., 2022).

Chronic unregulated inflammation produces toxic ROS on a continuous basis, which can cause DNA damage and genomic alterations, eventually leading to tumour formation. In contrast, inflammatory mediators like IFN- γ , TNF, IL-1 α/β , and IL-6, as well as transforming growth factors such as cytokines and vascular endothelial growth factor (VEGF), promote tumour growth by boosting blood supply (Ginwala et al., 2019). NF- κ B, the major inflammatory pathway, helps cancer cells survive by preventing apoptosis. Naringin has been demonstrated to use multiple strategies to interfere with cancer development, promotion, and progression by altering several uncontrolled signalling pathways related with inflammation, proliferation, apoptosis, autophagy, angiogenesis, invasion, and metastasis (Zhang et al., 2018). It is also reported that naringin administration resulted in considerable dose-dependent growth suppression as well as G1-phase cell cycle arrest. Moreover, treatment with naringin significantly increased p21WAF1 expression, irrespective of the p53 pathway, while decreasing cyclin and cyclin dependent kinase expression. In addition, Naringin therapy increased the phosphorylation of extracellular

signal-regulated kinase (ERK), p38 mitogen-activated protein kinase, and c-Jun N-terminal kinase. Furthermore, naringin therapy boosted Ras and Raf activity.

Conclusion

Ability of the flavanones to reduce inflammation, increase apoptosis, and inhibit proliferation, angiogenesis, metastasis, and invasion processes suggests that they have a high potential to become new and safe anticancer medicines. Naringin has been documented as having numerous pharmacological actions. Several recent reviews have summarised the many positive effects of naringin in both animal models and humans.

ABSTRACT

Banana stem, a widely available agricultural waste, holds significant potential for the production of biodegradable paper, offering a sustainable alternative to traditional paper sources. This study explores the feasibility of utilizing banana stem fibers as a raw material for paper production. The process involves the extraction of cellulose fibers from the banana stem through mechanical and chemical treatments, followed by papermaking techniques.

Keywords

Banana stem, Biodegradable paper, Sustainable materials, Cellulose extraction, Chemical treatment, Environmental impact, Sustainable development.

INTRODUCTION

In India, the Packaging Industry ranks fifth and experiences rapid annual growth of 24% to 27% [1]. The food processing sector, which heavily relies on flexible packaging, accounts for over 50% of total demand. By 2027, the Indian Food Packaging Market is expected to reach \$108.2 billion, with plastics being the predominant choice due to their hygiene and shelf life benefits [2]. However, the widespread use of plastic, especially in disposable packaging, has led to significant environmental concerns. Experts attribute the rise in plastic waste to the popularity of online retail and food delivery apps, contributing up to 22,000 tonnes of plastic waste monthly. Packaging industries are now shifting towards developing biodegradable materials to address the plastic waste problem [3]. These materials

decompose into natural polymers through microbial action shortly after disposal, offering a cost-effective and eco-friendly alternative to synthetic packaging.[4] Various options, including plant-based resources like bioplastics and recycled leaves, are being explored for their environmental safety [5]. Biodegradable and recyclable packaging alternatives, such as edible and biodegradable films, are gaining attention for their ability to mitigate long-term environmental pollution caused by synthetic polymers [6]. Polymers are essential components in both edible and non-edible coatings. It's not surprising considering their widespread use, like in ordinary house paint. In edible coatings, however, polymers such as proteins, starches, and gums take the spotlight. Interestingly, many of these edible polymers are simple derivatives of cellulose, a natural polymer abundant in plants and vital to their structure [7,8]. Paper products remain indispensable in daily life [9]. Around 90% of global paper production relies on wood, putting pressure on forest resources[10]. This reliance has led to increased deforestation to meet the demand for wood fiber [11]. Agricultural residues offer a promising alternative to paper production, thanks to their multiple economic, environmental, and technological benefits [12]. Banana (*Musa* spp.), a prominent tropical and subtropical fruit crop cultivated across nearly 9 million hectares worldwide, is particularly noteworthy. Its leaves find versatile uses in cooking, wrapping, and serving food across various cuisines in tropical and subtropical regions. In this study, the waste material of the banana stem after harvesting is utilized for the production of biodegradable paper without the use of any chemicals. To overcome the pollution and hazardous substances that are released into the environment and polluting the globe we developed a method without the usage of chemical and green technology to save the lives present in the environment. The product has been prepared from banana stems and they contain a high amount of cellulose to degrade easily which shows efficiently the conversion of waste materials into a value-added product.

MATERIALS AND METHODS

Banana stem fibers are the main source of raw material used to make biodegradable paper from the stem. The pulp used in the production of paper is made by extracting and processing these fibers. In addition, water required for retting or cleaning the fibers is usually utilized in the process. The banana stem was washed using distilled water and

chopped into several thin pieces. Chopped pieces were then sun-dried for 2 days to remove all moisture. Chopped pieces (250–1000 g) were then added into boiling water of about 1–2 liters for 30 mins. The boiled pieces were then strained and washed with distilled water. The pieces were then blended for 5–10 min in a blender with 500 ml water to form a pulp. The pulp was placed in a container of water and strained using a screen to get interlocked fibers which were dried to form paper.

Harvesting of Banana Stem: Cut the banana stems into small pieces and soak them in water for a few days to soften them. This process helps to break down the fibers and make them easier to pulp.

Figure 1: Harvesting of Banana Stem

Boiling and Pulping: After soaking, boil the banana stem pieces to further soften them. Then, using a blender or a pulping machine, grind the boiled stems into a pulp. This pulp contains the fibers needed to make paper.

Figure 2: Boiling and Pulping

Creating a Pulp Slurry: Mix the banana stem pulp with water to create a slurry. The consistency of the slurry will determine the thickness of the paper.

Figure 3: Preparation of slurry

Formation of Sheets: Pour the pulp slurry onto a flat surface like a screen or a mold. Spread it evenly to form a thin layer or multiple layers to create thicker paper. Once the pulp is evenly spread, cover it with another screen or cloth and press it to remove excess water. Then, carefully remove the newly formed paper sheet and allow it to dry. This can be done by air drying or using a drying machine. After drying, the paper may need to be flattened or trimmed to achieve the desired size and shape.

Figure 4: Preparation of Paper

CONCLUSION

This simple ecofriendly packaging sheet is safe for food packaging as its process does not involve the use of any harmful chemicals. Based on the available existing methods, Chemicals are being used as an ingredient for the preparation of paper. To overcome the pollution and hazardous substances that are released into the environment and polluting the globe we developed a method without the usage of chemical and green technology to save the lives present in the environment. The product has been prepared from banana stems and they contain a high amount of cellulose to degrade easily which shows efficiently the conversion of waste materials into a value-added product.

ABSTRACT

The use of feature reduction strategies including classification algorithms that aid in the prediction of illnesses including human malignancies is examined in this research. The system's precision becomes improved, and the system's storage and processing requirements are reduced, according to a review of features derived by using reduction techniques in this paper. Understanding the process behind aberrant gene expression patterns and how that contributes to diseases like cancer has become increasingly crucial in recent years toward early diagnosis and treatments. The categorization of gene expression data is facing several challenges¹⁶. Addressing these challenges through effective computational tools and techniques is crucial for enhancing the predictive power of gene expression data analysis. The dimensionality reduction techniques are essential for identifying the most informative genes from thousands of gene expression measurements. The techniques like feature extraction helps in reducing the dimensionality of the data while retaining the most relevant features (genes) that contribute significantly to the prediction task. Popular methods include filter-based approaches (e.g., univariate statistical tests), wrapper methods (which evaluates the features based on the performance of a specific machine learning algorithm), and embedded methods for feature selection.

In this study, various classification algorithms are used for analysis of the data obtained by the dimensionality reduction techniques and analyses the accuracy of the predicted model for cancer detection. The effectiveness of classifiers was measured using several metrics, including median absolute error (MAE), F-Measure, and mean squared log eError

(MSLE). These outcomes demonstrated that dimensionality reduction enhances the classifiers' performance.

Keywords

Epigenetics, biomarkers, feature selection, cancer prediction, gene expression data, and feature reduction.

Introduction

As a result of the trends and development in the technology, an enormous amount of data is being produced(health care). There are many machine learning models for examining the patterns or properties of these data. These results will help the medical professionals in taking decisions. Some characteristics in the created datasets are important for instructing machine learning algorithms. In a few cases, some features may not be significant while others might have no bearing on the outcome of a prediction. Machine learning algorithms are less burdened when these unnecessary or less significant attributes are ignored or removed[1]. Dimensionality reduction seems to be a technique for minimizing the number of attributes together in a dataset while preserving the same or more variance and it is practical. As a component of the preparation process, we perform dimensionality reduction before completing the model's training process. Depending on how many constituents or features we preserve, we typically lose 1% to 15% of the unpredictability in the original information whenever we reduce the dimensions of a dataset. Less dimensional data takes less computation as well as training time, which enhances the real performance of machine learning techniques. Feature-rich machine learning challenges slow down training to an absurdly slow pace. In high-dimensional geometry, the majority of data points were located quite near the boundary. This is due to a large amount of room in high dimensions. The majority of data points in a high-dimensional database are probably located far apart from one another. As a result, training the algorithms upon that high-dimensional data is not possible effectively or efficiently. Dimensionality reduction prevents the issue of overfitting and eliminates data noise. This will increase the model's precision. The high-dimensionality issue well with gene expression data information is solved in research on the hybridization

of feature selection as well as extraction methods for cancer detection using an attribute selection method termed (F-score).

To forecast several cancer types, including chest, colon, brain, kidney, lungs, and thyroid, as well as uterine, the naive base, random forests, as well as support vector machine methods are presented. The findings demonstrate that, in the majority of cases, classification accuracy advances, indirectly demonstrating reliability [2]. This research focuses on a gene expression data process known as 5-methylcytosine(m5c), which occurs when the methyl group (CH₃) is joined to the cytosine's carbon 5 [7]. Due to the poor modeling of input sequence data, several machine learning methods employed for methylation identification perform significantly worse. Over the past few decades, interest in cancer sickness has increased significantly. The risk of cancer can increase as a result of epigenetic biomarkers, which can alter gene expression data in either a heritable manner or without altering the DNA sequence. A small molecule, which gives a DNA, enzyme or other molecules a methyl group through an internal chemical reaction. Presence of methyl groups influences the biologic activity of some compounds. For instance, if a gene's DNA is methylated it becomes switched off and stops making proteins. The risk of acquiring cancer or other diseases may vary as the epigenetic marks on genes or proteins are influenced.

DIMENSINALITY REDUCTION TECHNIQUES

An important epigenetic element that is critical to the development and spread of human malignancies is gene expression data or DNA methylated data[2]. As a result, it might be used as a biomarker for cancer in its early identification and as a gauge of therapy effectiveness. More precisely, it is well known that a tumor suppressor-suppressing mechanism for cancer is caused by aberrant methylation on CpG islands within the promoter region [4], [5]. Gene expression data can alter the gene transcription in cells whenever they split from regenerative medicine into specific tissue cells, but it cannot alter the genotype of the DNA. The cell did not convert to a stem cell or some other cellular type once the underlying genetic expression stabilized [2]. Understanding the molecular pathways that cause early epigenetic alterations is therefore essential for the discovery of innovative cancer therapeutics. of carcinogenesis may be required. Age, location, lifestyle, as well as illness condition, are just a few of the variables that might affect gene expression

data. The large dimensionality & high noises in the gene expression data database are two important computational issues that are thought to present considerable classification difficulty. Therefore, throughout the training phase, this may result in classification performance degradation and increase the danger of overfitting. To distinguish between normal samples and malignant samples, this combination of discriminative traits will be crucial. Sometimes it will be effective to create new features again from ones that already exist using the segmentation method; combining feature extraction and extraction and classification will result in a more reliable approach for classification. Employing feature selection and extraction techniques increases overfitting and enhances predictive accuracy, streamline the classification process in terms of time and space complexity.

This group of distinguishing characteristics will be crucial for separating cancerous samples from standard ones. More often than not it will be more effective to create new features from the ones that already exist using feature extraction, and at other times combining feature extraction with image retrieval will result in a more potent classification approach [6]. This should lessen overfitting, enhance prediction accuracy, streamline the time- & space-consuming categorization, as well as create new research opportunities.

The achievement of the classification may be impacted by the gene expression data data's high dimensionality as well as high noise levels, where another amount of information features is significantly larger than the total of specimens and the majority of these functionalities are not relevant for the accurate classification of cancer[2]. To accomplish dimension reduction whilst maintaining each of the crucial data required to differentiate among various tumor kinds, it is imperative to employ a computationally demanding tool, like choosing features as well as extraction algorithms. The feature extraction methodology, on the other hand, replaces the original characteristics with smaller cheaper selected features through certain functional mapping, speeding up the learning process algorithm as well as increasing prediction accuracy [5]. This method does not involve destroying the original features. Because of this, a new approach is suggested in this study based on the extent of gene expression data throughout two unique promoters as well as probes, somewhere inside whom the extracted features. This approach had to use a relatively small number of characteristics to speed things up in addition to enhancing forecasting power. While fewer features are employed by the proposed method combining feature identification and feature

extraction techniques, all of the discriminant characteristics that can be applied to cancer prediction remained. The hybridized feature selection, as well as extraction methodology, provides an efficient strategy that is quicker and more precise than when employing either feature selection but rather extraction.

CLASSIFICATION TECHNIQUES USED

The XGBoost, Random Forest classifier, Naive Bayes classifier, Support Vector Machine classifier(SVM) AND Logistic Regression are the five classification methods used in this study. The Nave-Bayes classifier includes the most straightforward and basic classifier that builds classifiers using the Bayes theorem estimating conditional probabilities for the stochastic process given existing observations. This classifier estimates separately the probability of every characteristic for a specific class label on the assumption that all features were independent of one another [8],[9][2]. This classifier is easy to use and makes decisions quickly in terms of computation. The random forest continues ahead as well as integrates weak predictors, starting by using decision trees having controlled variance, to create an ensemble. The robustness, lack of normalization, and susceptibility to collinearity of such a classifier are its benefits [10][2]. This transformation often employs nonlinear polynomial as well as radial basis kernel functions and is highly dimensional [2] [11]. The prediction quality for our trials is assessed using two metrics: median absolute error (MAE) as well as mean squared log Error (MSLE). [2] [12] provides the median absolute error as follows:

$$MAE = \frac{1}{x} \sum_{i=1}^n [x_i - y_i] \quad (1)$$

The equation calculates accuracy by comparing predicted class (xi) to actual class (yi) for each sample (n) in test set.

The mean squared log Error is defined as [2] [12]:

$$MSLE = \sqrt{\frac{1}{n} \sum_{i=1}^n (x_i - y_i)^2} \quad (2)$$

Additionally, we evaluate the classification results using the classification accuracy as well as F-measure metrics. The percentage of correctly predicted classes to all analyzed specimens is known as accuracy [2] [13] [14]:

$$Accuracy = \frac{t_p + t_n}{t_p + f_p + t_n + f_n} \quad (3)$$

Thus, false negative (fn) and false positive (fp) represent the misclassified instances while true positive (tp) and true negative (tn) values refer to correct classification of positive and negative instances, respectively. When there are about equal numbers of examples for all groups and the cost of misclassifying cancer was high, then the accuracy works well enough. Therefore, also use F-measure for depicting classifier's accuracy along with its reliability. As the F measure rises, the model's accuracy gets better.

A balancing F-measure seems to be a single score since accuracy and recall have quite a harmonic mean that may have either value from zero to one [13], [14].

$$F = \frac{2 \times \text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}} = \frac{2t_p}{2t_p + f_p + f_n} \quad (4)$$

REVIEW OF VERTICAL REDUCTION TECHNIQUES FOR CANCER PREDICTION

The dimensionality reduction seems to be a method for reducing the quantity of highly dimensional data while maintaining the authenticity of the original information improvement, a reduction in calculation time, and the reduction in the number of computational resources, are all benefits of image compression.

The following are the paper's main factors that contribute:

- Establishing a methodology for differentiating gene expression data.
- Using the statistical test of features all across sample sets to propose a unique vertical reduction.
- Developing a unique horizontal reduction method using horizontal asymmetrical gene expression data research to provide a new, condensed feature set.

Outlining a cascaded vertical and horizontal reduction method for vertical and horizontal gene expression data detection.

Classifier	Accuracy	F-measure	MAE	MSLE
Logistic Regression	95.2345	95.6	0.0651	0.2086
Naive Bayes	95.4123	95.6	0.0551	0.1874
Random Forest	96.8756	96.0	0.0431	0.1268
SVM	97.2436	97.2	0.0234	0.1056
XGBoost	98.5467	98.7	0.0145	0.0256

Table 1. Results of simple classification approaches

The findings indicate that whereas random forest seems to be the most effective in terms of MSLE, SVM would be the most accurate in terms of F-measure, accuracy, and MAE. This shows that with just 0.0145 as MAE, this system has a way to tell cancer patients apart from other cases that are not having 98.54% accuracy. Since XGBoost is the strongest amongst tested classification methods, we shall apply it going forward anytime classification is necessary.

VERTICAL AND HORIZONTAL GENE EXPRESSION DATA ANALYSIS

All samples are subjected to a vertical gene expression data analysis to identify the most distinct characteristics that can be used to distinguish between cancerous and non-cancerous samples. In reality, the vertical analysis seeks to take advantage of the variations in methylation levels among healthy and cancerous samples. In contrast, the horizontal gene expression data research looked for novel characteristics based on variations in methylation levels between samples. The new feature will be the average squared difference inside one window, which will serve as a reliable signal across that timeframe. This vertical reduction may reflect the minute variations here between 2 specimens there at the pixel level. That feature ranking approach uses a threshold number to decide whether to pick the characteristic or not. According to the predefined threshold, there is enough of a difference in the average scores of the normal and tumor samples to say that somehow a characteristic is discriminatory for classifying cancer. horizontal reduction, a method for analyzing horizontal gene expression data, divides each specimen into a plurality of windows, creates a fresh segmentation method for such a window by setting the preceding congestion window to something like a specified value as well as adding the disparity among succeeding values within every window.

CASCADED VERTICAL AND HORIZONTAL REDUCTION

A vertical and horizontal reduction technique that is cascaded operates as follows: As previously noted, vertical and horizontal reduction is first utilized on the entire dataset to identify certain discriminative characteristics that will be used in the following stage. The collection of characteristics that were chosen based on the vertical analysis is then subjected to horizontal reduction. The process needs to select a threshold value as well as the number

of pixels are the two input values. The threshold as well as window sizes are adjusted to achieve the a good prediction accuracy result.

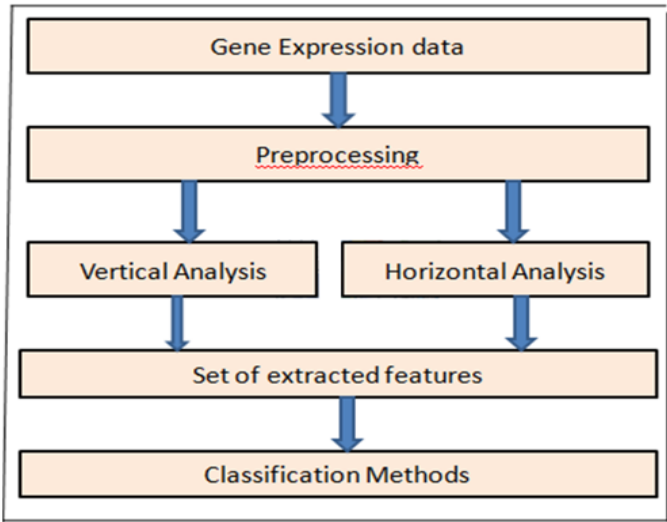

Figure 1: Cascaded Vertical And Horizontal Frequency Reduction

The cascaded vertical and horizontal reduction technique begins by applying vertical reduction to the entire dataset previously described to choose certain discriminative characteristics on which to base the following step is shown in the Figure 1. Each set of chosen features obtained first from trend analysis is then subjected to horizontal reduction. This selection thresholding as well as the window size are indeed the two data values that the method involves. The threshold as well as window sizes are adjusted to achieve the highest prediction accuracy.

Percentage	Accuracy	F-measure	MAE	MSLE
15%	96.9933	97.0	0.0201	0.1527
20%	97.1233	97.4	0.0251	0.1438
25%	97.3278	97.6	0.0257	0.1483
30%	98.0129	98.1	0.0212	0.0921
35%	98.2039	98.4	0.0187	0.0821

Table 2. Performance evaluation values- Results of Cascaded Reduction approach.

As shown in the picture, the cascaded vertical and horizontal reduction technique begins by applying vertical and reduction to the entire dataset previously described to choose certain discriminative characteristics on which to base the following step. Each set of chosen features obtained first from trend analysis is then subjected to horizontal reduction. This selection thresholding as well as the window size are indeed the two data values that the method involves. The threshold as well as window sizes are adjusted to achieve the highest prediction accuracy.

The suggested vertical reduction is implemented to all characteristics using various threshold levels to choose the different percentages of features with different values as 15%, 20%, 25%, 30% and 35%,. The cascaded technique is the most effective of all examined approaches, according to the findings of the investigation. Any discriminant trait that may be employed to diagnose cancer is retained while fewer features are used in the hybridized method between feature extraction process extraction approaches [2]. By selecting a small number of gene expression data variables, the hybridized feature selection, as well as extraction methodology, seems to be more efficient and precise than utilizing just feature selection or extraction as shown in Table 2.

GENE EXPRESSION DATA ANALYSIS AND CLASSIFICATION

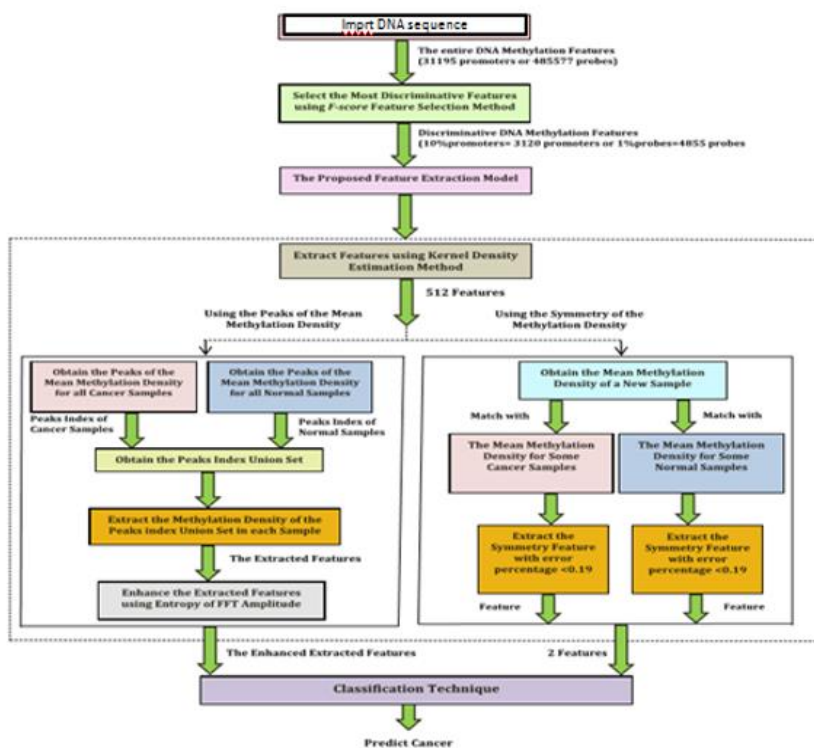

Here, we show the outcomes of the classification algorithms, used on the given dataset. The findings of our effective tests to classify breast cancer cells are displayed in the Tables 1. The prediction performance as well as f-measure for each approaches are shown in the table3 below.

Analysis	Logistic Regression	Naïve Bayes	Random Forest	SVM	XGBoost
Accuracy	96.32%	96.89	97.32	98.13	98.35%
F-measure	87%	89%	91%	92%	93%
MAE	0.06	0.05	0.03	0.02	0.01
MSLE	0.18	0.16	0.15	0.12	0.11

Table 3. Results of simple classification approaches on cascaded data.

PROPOSED METHOD

The suggested feature extraction model, which appears to involve two processes for feature extraction, is used by Function 2 of the feature selection operation. Identifying appropriate categories is the next step in the process. It appears that elimination is the first step in selecting features for the F-score. In Figure 3 we can see the planned layout of the building. The second approach uses several cutting-edge feature selection methods to sift through the average density of the entire genome and retrieve fresh, smaller features for use in the classification algorithm's prediction. The first strategy takes the discriminant classification model as input and utilizes the Kernel Parameter Estimation method to assemble 512 factors. An in-depth explanation of both methods is given below.

Classifier	Accuracy	F-measure	MAE	MSLE
Logistic Regression	98.01 %	93.43 %	0.0491	0.1776
Naïve Bayes	98.12 %	94.12 %	0.0231	0.1674
Random Forest	98.134 %	94.45 %	0.0549	0.1258

SVM	98.56%	95.84%	0.0184	0.1216
XGBoost	99.02%	96.03%	0.0113	0.1176

Table 4. Analysis of classification approaches on the extracted features.

As shown in Table 4, the improvement in predictive performance along with reduction in model complexity are both consistently demonstrated by the findings, for majority of cases, through combining F-score feature selection approach with proposed feature extraction methods [2]. Thereby, this leads to a significant reduction in time required for algorithm prediction as well as retrieval of new compressed attributes used for classification algorithm's prediction. The very first strategy accepts discriminant classification model, then 512 factors are composed using Kernel Parameter Estimation methodology.

CONCLUSION

An expanding body of research has shown that abnormal patterns of gene expression are essential to the genesis of human malignancies. In order to improve the model's interpretability and prediction ability while lessening the effects of dimensionality, dimensionality reduction strategies seek to extract and preserve the most informative characteristics from a high dimensional dataset. This technique is based on a cascaded vertical and horizontal reduction techniques. The efficiency of various classifiers is used to gauge how successful the suggested hybridization technique is. The study's findings indicate that using a hybrid strategy can greatly enhance prediction accuracy in the majority of situations while also speeding up the training procedure.

The cascaded vertical and horizontal reduction strategy [2] takes advantage of the synergistic effect of multiple similar approaches, such as vertical and horizontal reduction. Out of all the methods evaluated in this research, the cascaded vertical and horizontal reduction approach yielded the best outcomes concerning both MAE and MSLE. It has been observed that not all recommended feature extraction techniques contribute to improved accuracy across all tissue types, suggesting that their effectiveness may vary depending on the specific context [2]. Thus, taking into account the outcomes of the relevant trials, it is indirectly shown that the proposed hybrid technique, which is based on gene expression data, is reliable in addressing cancer prediction difficulties.

Abstract

Retinal ArterioVenous (AV) nicking is a prominent microvascular abnormality in retina. At both sides of vessel crossing, there will be a decrease in venular caliber. Retinal AV nicking is a strong predictor of eye diseases such as branch retinal vein occlusion, arteriolar narrowing and cardiovascular diseases such as stroke, and atherosclerosis. An automated method is necessary for quantitative AV nicking assessment. From the input retinal image, the vascular network is first extracted using the multiscale line detection method. The crossover point detection method is then applied to locate all AV crossing points. At each crossover point detected, the four vessel segments associated with the vein and artery are identified and two venular segments are recognized by the artery vein classification method. The vessel widths along with the two venular segments are measured and analyzed to compute the AV nicking severity of the crossover.

Keywords

Retinal arteriovenous nicking, retinal vein occlusion, arteriolar narrowing, multiscale line detection method.

INTRODUCTION

ARTERIOVENOUS NICKING

Hypertension has stiffened the arteries and at arteriovenous cross over point, they indent and displace the more compliant veins called arteriovenous nicking, this phenomenon does not occur in the normal fundus. Different research studies show that, AV nicking is strongly associated with hypertension, systemic diseases and stroke. This implies the importance of

the quantification of AV nicking to identify people who are at high risk of cardiovascular heart disease.

Figure 1. Arteriovenous nicking

Cardiovascular diseases such as stroke, atherosclerosis, and coronary heart disease are the causes of mortality and morbidity worldwide. The state of the retinal vessel will show the cardiovascular condition. Retinal blood vessel morphology is an important indicator of diseases such as hypertension, diabetes and cardiovascular disease such as arteriosclerosis. The detection and measurement of retinal blood vessels are necessary for quantifying the severity level of disease. To quantify these features for medical diagnosis, accurate vessel segmentation plays a critical role. Although many methods have been developed for recent years, but significant improvement is still a necessity due to the limitations in state of the methods, which include:

- Poor vessel segmentation in the presence of vessel central light reflex.
- Poor segmentation at bifurcation point and branching point and crossover regions.
- Tends to merge close vessels.
- Missing of small vessels.
- False vessel detection at the optic disk region and pathological regions.

The first three limitations are most important due to their great impact on vascular network obtained. For example, If central reflex pixels in the image are not recognized as part of a vessel, then the vessel may be misunderstood as two vessels. If two close vessels are merged together, they will be considered as one wide vessel.

An automated method for quantification of arteriovenous nicking has been developed by several researchers. Nguyen et al. [1] have developed an automated method for the AV

nicking measurement, where the severity of ArterioVenous(AV) nicking is represented by a continuous value produced. The continuous value provided by Nguyen's method is difficult to interpret. In addition, the widths are not normalized. Therefore, the AV nicking severity score may vary depending on the variability of the vessel width's of different patient. In this method [1], vein widths are computed directly from the segmented images.

Martinez Perez et al. [3] presented a semi- automatic method for retinal vascular trees analysis, in which the venous and arterial trees were analyzed separately.

Li et al. [4] presented an automated method for determining the ArterioVenous Ratio (AVR), but, this method still requires manual user input to separate arteries from veins.

Tramontan et al. [5] extended an algorithm with structural AV discrimination features and enhanced vessel tracking method obtaining a correlation of 0.88 on 20images.

METHODOLOGY

The retinal image is given as the input for system and it will returns a real number quantifying the severity level for AV crossing point are detected from that image. From the input retinal image, the vessel segmentation technique is applied to extract the blood vessels from the image background. A crossover point detection method is performed to detect all AV crossing locations within the retinal image. The vessel widths of each venular segment are then measured and analyzed for AV nicking measurement.

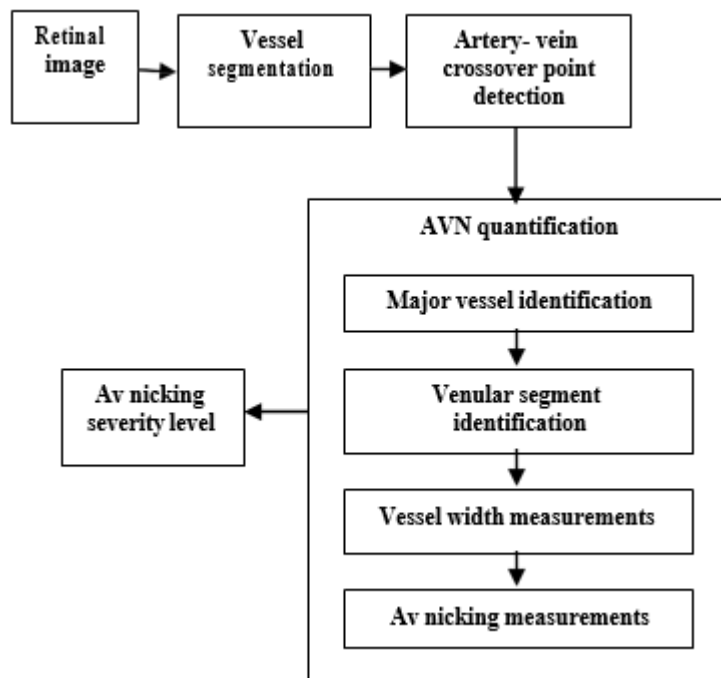

Figure 2. Block Diagram for Arteriovenous Nicking Quantification

Vessel Segmentation

Blood vessel segmentation in high resolution retinal color images are complicated due to vessel central light reflex, vascularization, background homogenization and other impulse noises. Although many methods have been proposed for retinal vessel extraction, they are not effective for detecting blood vessels in our image set that includes high resolution images with the presence of vessel central light reflex.

Figure 3. Block diagram for vessel segmentation

Figure 4. Input Image

The vascular network is made up of three landmark points such as branching, bifurcation, and crossover. A crossover is the place where two vessels (i.e., a vein and an artery) cross each other, while a bifurcation or a branching is the place where one vessel splits into two vessels.

Figure 5. Blood Vessel Extractions

A blood vessel extraction is performed by multi scale line detection method. Multi scale line detector is a generalized basic line detector by varying the length of the aligned lines. The generalized line detector is defined as:

$$R_W^L = I_{max}^L - I_{avg}^W \quad (1)$$

Where, $1 \leq L \leq W$,

R_W^L is the response of line detectors at scale L ,

I_{max}^L is the maximum length of the scale L ,

I_{avg}^W is the average width of the scale L.

By changing the values of L, line detectors at different scales are achieved. The main idea behind this is that the inclusions of surrounding vessel pixels are avoided by line detector with shorter length and hence, give correct responses to three situations such as bifurcation, branching, cross over point. To demonstrate this improvement, the responses of the basic line detector and generalized line detector at different pixel position are examined. The basic line detector produces high response to background pixels for three cases such as bifurcation, branching, cross over point. While, the generalized line detector gives much lower values for these cases, in order to distinguish vessel from background pixels.

Artery Vein Crossover Point Detection

- Potential crossover point localization

The potential crossover point localization aims at localizing all possible locations of crossovers and bifurcations in a skeleton image.

Figure 6. Block diagram for Artery Vein Crossover Point Detection

To achieve this, we compute the crosspoint number for each skeleton pixel as follows:

$$cpn(P) = \frac{1}{2} \sum_{i=1}^8 |N_i(P) - N_{i+1}(P)| \quad (2)$$

Where, $N_i(P)$ is the neighbor pixels of P (in a 3×3 neighborhood) named in an anticlockwise order. The $cpn(P)$ computed for every skeleton pixel represents the number of vessel segments connected to pixel in the skeleton image. In order to detect crossovers that are represented as two bifurcation points in the skeleton image, two bifurcation candidates are grouped as one crossover, if they are connected by at most of T pixels. The segment that connects the two bifurcation point is identified and its middle point is marked and served as the true position of that crossover

- Crossover point pruning

The grouping of two close bifurcation points as one crossover helps to detect those crossovers that result as two bifurcation points in the skeleton image. However, this process also falsely detects the point which has the same configuration in the skeleton image as

crossovers. To distinguish true crossovers from results, two geometrical features of each crossover are analyzed:

1. The intersection angles formed by the two vessels at the crossing (α_1 and α_2).
2. The two angles representing the curvature of each vessel at the crossing.

Figure 7. Localization of Crossover and Branching point

FEATURE EXTRACTION

In image processing, feature extraction is a special form of dimensionality reduction. When the input data to an algorithm is too large to be processed and it is suspected to be notoriously redundant then the input data will be transformed into a reduced representation set of features (features vector). Transforming the input data into the set of features is called feature extraction. The extracted features are expected to contain the relevant information from the input data, so that the desired task can be performed by using this reduced representation instead of the complete initial data. Feature extraction techniques are applied to get features that will be useful in classifying and recognition of images. The different features are

- Area
- Perimeter
- Maximum radius
- Minimum radius
- Eccentricity

- Equivalent diameter
- Elongatedness
- Entropy
- Dispersion
- Contrast
- Correlation
- Homogeneity
- Energy
- Standard deviation
- Skewness
- Shape
- Texture
- Intensity
- Colour

Among these features, area, perimeter, maximum radius, minimum radius, eccentricity, equivalent diameter, elongatedness, entropy, dispersion are used by radial basis neural network classifier for classification, because it uses radial basis functions as activation functions. Radial basis function is a real valued function whose value depends on the distance from origin or center. Then, contrast, correlation, homogeneity, energy, standard deviation, skewness, mean are used by support vector machine classifier because, it depends on the concept of decision planes that define decision boundaries. A decision plane is one that separates between a set of objects having different class memberships.

AREA:

Area is the quantity that expresses the extent of a two-dimensional figure or shape in the plane.

$$A = \pi r^2 \quad (3)$$

Where,

A is a area,

r is a radius.

PERIMETER:

A perimeter is a path that surrounds a two- dimensional shape. It is the length of the outline of a shape. The perimeter of a circle or ellipse is called its circumference.

$$P = 2\pi r \quad (4)$$

Where,

P is a perimeter,

r is a radius.

RADIUS:

The radius of a circle or sphere is the length of a line segment from its center to its perimeter. The radius of a circle is the length of the line from the center to any point on its edge.

$$r = \sqrt{\frac{A}{\pi}} \text{ (or) } Radius = \frac{D}{2} \quad (5)$$

Where,

r is a radius,

D is a diameter, A is a area.

ECCENTRICITY:

It is a quantity defined in terms of semimajor and semiminor axes. The eccentricity can also be interpreted as the fraction of the distance along the semimajor axis at which the focus lies,

$$e = \frac{c}{a} \quad (6)$$

Where,

E is a eccentricity,

c is a center of axes,

ENTROPY:

Entropy is a measure of the uncertainty in a random variable.

$$\text{Entropy} = \sum_{i,j=0}^{N-1} -\ln (P_{ij})(P_{ij}) \quad (7)$$

DISPERSION:

The measures of dispersion summarize how spread out (or scattered) the data values are on the number line. These functions describe the deviation from the arithmetic average (mean) of a data sample. The standard deviation and the variance are popular measures of dispersion.

CONTRAST:

Contrast is defined as the separation between the darkest and brightest area.

$$\text{Contrast} = \sum_{i,j=0}^{n-1} P_{ij}(i-j)^2 \quad (8)$$

CORRELATION:

Correlation is computed into what is known as the correlation coefficient, which ranges between -1 and +1.

$$\text{Correlation} = \sum_{i,j=0}^{n-1} P_{i,j} \frac{(i-\mu)(j-\mu)}{\sigma^2} \quad (9)$$

HOMOGENEITY:

Homogeneity is defined as the quality or state of being homogeneous.

$$\text{Homogeneity} = \sum_{i,j=0}^{n-1} \frac{P_{i,j}}{1+(i-j)^2} \quad (10)$$

ENERGY:

It provides the sum of squared elements in the GLCM. Also known as the uniformity or the angular second moment.

$$\text{Energy} = \sum_{i,j=0}^{N-1} (P_j)^2 \quad (11)$$

Area	= 75
Perimeter	= 29
Maximun Radius	= 79.9062
Minimun Radius	= 70.2922
ECT (eccentricity)	= 0.47556
Entropy(Entpy)	= 0.6104
Equivdiameter (Eqd)	= 6.0765
Elongatedness (En)	= 0.0011355
Dispersion (Dp)	= 2.7554
Contrast	= 2.6121
Homogeneity	= 0.95335
Correlation	=0.76814
Energy	=0.71961
Standard Deviation	=21.8808
Skewness	=1.5145
Mean	=13.5511

Image classification

Image classification analyzes the numerical properties of various image features and organizes data into categories. Classification algorithms typically employ two phases of processing: training and testing. In the initial training phase, characteristic properties of typical image features are isolated and, based on these, a unique description of each classification category, i.e. training class, is created. In the subsequent testing phase, these feature-space partitions are used to classify image features. The description of training classes is an extremely important component of the classification process.

Figure 8 Image used for feature extraction

RADIAL BASIS FUNCTION NETWORK

A radial basis function network is an artificial neural network that uses radial basis functions as activation functions. A RBF neural network consists of three layers, namely the input layer, the hidden layer and the output layer. The input layer takes in the coordinates of the input vector to each unit in the hidden layer. Each unit in the hidden layer then produces an activation using the radial basis function used in the layer. Finally, each unit of the hidden layer computes a linear combination of the activations and produces a classified output in the output layer units. The output is entirely based on the use of the activation function used in the hidden layer and the weights associated with the links between the hidden layer and the output layer. Radial basis function networks have many uses, including function approximation, time series prediction, classification, and system control.

Accuracy = 92.4528

Sensitivity = 96.2963

Specificity = 88.4615

SVM CLASSIFIER (SUPPORT VECTOR MACHINE)

SVM is a single layer highly non-linear network, which minimizes structural risk and has higher generalization ability in the sense that it can classify new data correctly. It optimizes the class separation boundary such that the distance from a feature to the class separating hyper plane is maximum simultaneously.

Abstract

A fire outbreak is a hazardous act that leads to numerous consequences. Detecting a fire at an early stage and extinguishing it can aid in prevention of various accidents . Till now we rely on human resource. This often leads to risking the life of that person. Therefore, fire security becomes an important aspect to save human lives. Behalf of that , A fire extinguishing robot has been proposed and designed which detects the fire location and extinguish fire by using sprinklers on triggering the pump. The robot uses three flame sensors for accurate fire detection, Gear motors for movement and water ejecting pump for turn off the fire. This proposed model of fire Extinguishing Robot using Arduino Which is used to detect presence of fire and extinguishing it automatically without any human interference. The whole operation is controlled by an Arduino UNO micro- controller in our Proposed System.

Keywords

Fire Extinguishing Robot using Arduino.

INTRODUCTION

Robotics is part of Today's communication. In today's world ROBOTICS is fast growing and interesting field. It is simplest way for latest technology modification. Now a day's communication is part of advancement of technology, so we decided to work on robotics field, and design something which will make human life simpler in day today aspect. Thus we are supporting this cause. Robotics is the branch of technology that deals with the design, construction, operation, structural disposition, manufacture and application of robotsand computer systems for their control, sensory feedback, and information processing.

Obstacle detection and avoidance robots are intelligent robots which can perform desired tasks in unstructured environments by finding and overcoming obstacles in their way without continuous human guidance. In robotics, obstacle avoidance is the task of satisfying some control objective subject to non-intersection or non-collision position constraints. Normally obstacle avoidance is considered to be distinct from path planning in that one is usually implemented as a reactive control law while the other involves the pre-computation of an obstacle-free path which a controller will then guide a robot along. A practical real-time system for passive obstacle detection and avoidance is presented.

Robot Sensors are essential components in creating autonomous robots as they are the only means for a robot to detect information about itself and its environment. As little as one sensor is needed by a robot, though increasing the number and variety of sensors tends to increase the robot's ability to get a more thorough understanding of the world around it.

There are a wide variety of sensors available which are capable of measuring almost anything, from environmental conditions (distance, light, sound, temperature) to angular and linear acceleration, forces and distances. The first sensor often incorporated into a mobile robot is a distance sensor, which is usually in the form of an infrared or ultrasonic sensor. In both cases, a pulse (of light or sound) is sent and its reflection is timed to get a sense of distance. Usually these values are sent to the controller many times each second.

Robot Shop offers a wide variety of sensors applicable to almost any robotics project. If you are looking for a distance sensor, we offer them in a variety of configurations and optimal distances to suit almost any budget. If you are looking for a more professional solution for measuring distances, take a look at our selection of scanning laser rangefinders, which are able to scan over >180 degrees (and less than 1 degree of accuracy) in well under 1 second. IR Pair is used as sensor to detect the presence of objects. IR LED is used for detecting objects.

In this project mainly when ever robot senses any obstacle automatically diverts its position to left or right and follows the path. Robot consists of two motors, which control the side pair wheels of each and help in moving forward and backward direction. Robot senses the object with help of obstacle sensor. IR pair is used for detecting the obstacle. The two basic parts for working with IR are the emitter and the detector. The emitter is typically an LED that emits near-infrared light.

Infrared (IR) light is electromagnetic radiation with a wavelength longer than that of visible light, measured from the nominal edge of visible red light at 0.74 micrometers (μm), and extending conventionally to 300 μm . These wavelengths correspond to a frequency range of approximately 1 to 400 THz, and include most of the thermal radiation emitted by objects near room temperature. Microscopically, IR light is typically emitted or absorbed by molecules when they change their rotational-vibration movements.

Infrared light is used in industrial, scientific, and medical applications. Night-vision devices using infrared illumination allow people or animals to be observed without the observer being detected. In astronomy, imaging at infrared wavelengths allows observation of objects obscured by interstellar dust. Infrared

Imaging cameras are used to detect heat loss in insulated systems, observe changing blood flow in the skin, and overheating of electrical apparatus.

IR LED IR detectors are specially filtered for Infrared lighted are not good at detecting visible light. On the other hand, photocells are good at detecting yellow/green visible light, not well at IR light.

IR detectors have a demodulator inside that looks for modulated IR at 38 KHz. Just shining an IR LED won't be detected, it has to be PWM blinking at 38KHz. Photocells do not have any sort of demodulator and can detect any frequency (including DC) within the response speed of the photocell (which is about 1KHz). IR detectors are digital out - either they detect 38KHz IR signal and output low (0V) or they do not detect any and output high (5V). Photocells act like resistors, the resistance changes depending on how much light they are exposed to.

A photodiode is a type of photo detector capable of converting light into either current or voltage, depending upon the mode of operation. The common, traditional solar cell used to generate electric solar power is a large area photodiode.

Photodiodes are similar to regular semiconductor diodes except that they may be either exposed (to detect vacuum UV or X-rays) or packaged with a window or optical fiber connection to allow light to reach the sensitive part of the device. Many diodes designed for use specifically as a photodiode use a PIN junction rather than a p-n junction, to increase the speed of response. A photodiode is designed to operate in reverse bias. In this project we develop a robot such that it will be moving according to path assigned to it if at all there is

any obstacle in between then the robot stops and change its direction. This sort of project is very much useful in the industries where the automated supervision is required.

This project is basic stage of any automatic robot. This robot has sufficient intelligence to cover the maximum area of provided space. It has a infrared sensor which are used to sense the obstacles coming in between the path of robot. It will move in a particular direction and avoid the obstacle which is coming in its path.

A robot obstacle detection system comprising: a robot housing which navigates with respect to a surface; a sensor subsystem having a defined relationship with respect to the housing and aimed at the surface for detecting the surface, the sensor subsystem including: an optical emitter which emits a directed beam having a defined field of emission, and a photon detector having a defined field of view which intersects the field of emission of the emitter at a finite region; and a circuit in communication with the detector for redirecting the robot when the surface does not occupy the region to avoid obstacles.

Obstacle sensors are nothing but the IR pair. As the transmitter part travel IR rays from to receiver here also transmitter send the data receiver but these IR pair are places beside each other. So whenever an obstacle sensor got a obstacle in between its way the IR rays reflects in a certain angle. As they are placed side by each.

We have used two D.C motors to give motion to the robot. The construction of the robot circuit is easy and small .The electronics parts used in the robot circuits are easily available and cheap too.

Here we are also adding an application of cleaning to this obstacle detecting robot that is by adding a electrical device known as blower. This blower have a fan with attach motor which work as vacuum cleaner and this robot because of this application can be sent to any where to clean a particular place or area the motor used here is D.C motor.

Blowers for ventilation and for industrial processes that need an air flow. Fan systems are essential to keep manufacturing processes working and consist of a fan, an electric motor, a drive system, ducts or piping, flow control devices, and air conditioning equipment (filters, cooling coils, heat exchangers, etc.).

Fans, blowers and compressors are differentiated by the method used to move the air, and by the system pressure they must operate against. Blowers can achieve much higher

pressures than fans, as high as 1.20 kg/cm². They are also used to produce negative pressures for industrial vacuum systems.

METHODOLOGY

This advanced fire fighting robotic system independently detects and extinguishes fire. In the age of technology, the world is slowly turning towards the automated system and self-travelling vehicles, fire fighters are constantly at a risk of losing their life. Fire spreads rapidly if it is not controlled. In case of a gas leakage there even may be an explosion. So, in order to overcome this issue, safe guard live of our hero, our system comes to the rescue. This fire fighting robotic system is powered by Arduino Uno development board it consists of the mounted on a geared motors for obstacles detection and free path navigation, it is also equipped with the fire flame sensor for detecting and approaching fire it also makes use of water tank and spray mechanism for extinguishing the fire. Water spraying nozzle is mounted on servo motor to cover maximum area. Water is pumped from the main water tank to the water nozzle with the help of water pump. The fire fighting robot is overall monitored via camera. The overall system can be control through mobile. The current status of the system is receiving by monitor.

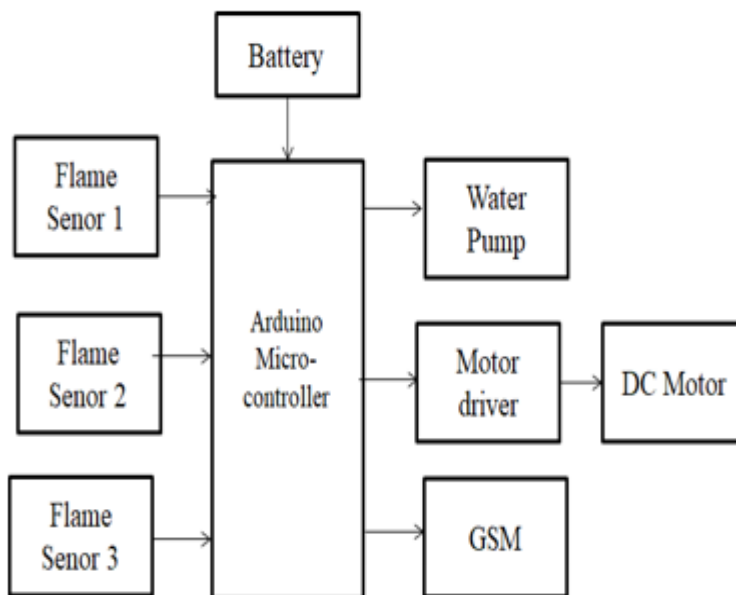

Figure 1 Block Diagram for fire fighting robotic system

ARDUINO UNO R3 MICROCONTROLLER

The Arduino Uno R3 is a microcontroller board based on the ATmega328. It has 14 digital input/output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz crystal oscillator, a USB connection, a power jack, an ICSP header, and a reset button. It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or power it with a AC-to-DC adapter or battery to get started. The Uno differs from all preceding boards in that it does not use the FTDI USB-to-serial driver chip. Instead, it features the Atmega16U2(Atmega8U2 up to version R2) programmed as a USB-to-serial converter. Revision 2 of the Uno board (A000046) has a resistor pulling the 8U2 HWB line to ground, making it easier to put into DFU mode.

Revision 3 of the board (A000066) has the following new features:

1.0 pin out: added SDA and SCL pins that are near to the AREF pin and two other new pins placed near to the RESET pin, the IOREF that allow the shields to adapt to the voltage provided from the board. In future, shields will be compatible with both the board that uses the AVR, which operates with 5V and with the Arduino Due that operates with 3.3V. The second one is a not connected pin, that is reserved for future purposes.

Stronger RESET circuit.

Atmega 16U2 replace the 8U2.

Figure 2 Arduino UNO R3 micro-controller

- POWER SUPPLY

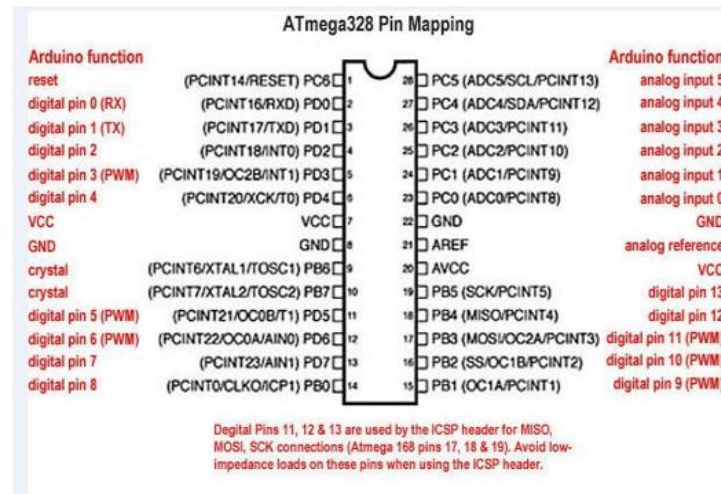

Figure 3 Tmega328 pin Mapping

The Arduino Uno can be powered via the USB connection or with an external power supply. The power source is selected automatically. External (non-USB) power can come either from an AC-to-DC adapter (wall-wart) or battery. The adapter can be connected by plugging a 2.1mm centre-positive plug into the board's power jack. Leads from a battery can be inserted in the Gnd and Vin pin headers of the POWER connector. The board can operate on an external supply of 6 to 20 volts. If supplied with less than 7V, however, the 5V pin may supply less than five volts and the board may be unstable. If using more than 12V, the voltage regulator may overheat and damage the board. The recommended range is 7 to 12 volts. The power pins are as follows:

VIN.- The input voltage to the Arduino board when it's using an external power source (as opposed to 5 volts from the USB connection or other regulated power source). You can supply voltage through this pin, or, if supplying voltage via the power jack, access it through this pin.

5V.- The regulated power supply used to power the microcontroller and other components on the board. This can come either from VIN via an on-board regulator, or be supplied by USB or another regulated 5V supply.

3V3 - A 3.3 volt supply generated by the on-board regulator. Maximum current draw is 50 mA.

GND. Ground pins.

- **Arduino Architecture**

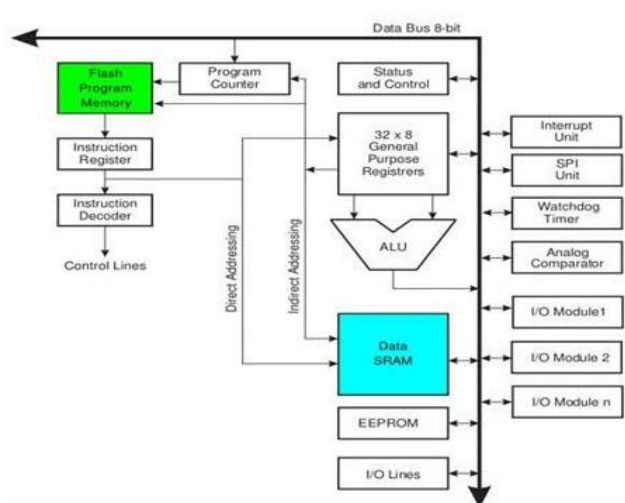

Figure 4 Arduino Architecture

RELAY BASIC DESIGN AND OPERATION

A simple electromagnetic relay consists of a coil of wire wrapped around a soft iron core, an iron yoke which provides a low reluctance path for magnetic flux, a movable iron armature, and one or more sets of contacts (there are two in the relay pictured). The armature is hinged to the yoke and mechanically linked to one or more sets of moving contacts. It is held in place by a spring so that when the relay is de-energized there is an air gap in the magnetic circuit. In this condition, one of the two sets of contacts in the relay pictured is closed, and the other set is open. Other relays may have more or fewer sets of contacts depending on their function. The relay in the picture also has a wire connecting the armature to the yoke. This ensures continuity of the circuit between the moving contacts on the armature, and the circuit track on the printed circuit board (PCB) via the yoke, which is soldered to the PCB.

When an electric current is passed through the coil it generates a magnetic field that activates the armature and the consequent movement of the movable contact either makes or breaks (depending upon construction) a connection with a fixed contact. If the set of contacts was closed when the relay was de-energized, then the movement opens the contacts and breaks the connection, and vice versa if the contacts were open.

When the current to the coil is switched off, the armature is returned by a force, approximately half as strong as the magnetic force, to its relaxed position. Usually this force

is provided by a spring, but gravity is also used commonly in industrial motor starters. Most relays are manufactured to operate quickly. In a low-voltage application this reduces noise; in a high voltage or current application it reduces arcing.

When the coil is energized with direct current, a diode is often placed across the coil to dissipate the energy from the collapsing magnetic field at deactivation, which would otherwise generate a voltage spike dangerous to semiconductor circuit components. Some automotive relays include a diode inside the relay case. Alternatively, a contact protection network consisting of a capacitor and resistor in series (snubber circuit) may absorb the surge. If the coil is designed to be energized with alternating current (AC), a small copper "shading ring" can be crimped to the end of the solenoid, creating a small out-of-phase current which increases the minimum pull on the armature during the AC cycle.

Keil C51 C Compilers

Direct C51 to generate a listing file

Define manifest constants on the command line

Control the amount of information included in the object file

Specify the level of optimization to use

Specify the memory models

Specify the memory space for variables The Keil C51 C Compiler for the 8051 microcontroller is the most popular 8051 C compiler in the world. It provides more features than any other 8051 C compiler available today.

The C51 Compiler allows you to write 8051 microcontroller applications in C that, once compiled, have the efficiency and speed of assembly language. Language extensions in the C51 Compiler give you full access to all resources of the 8051.

The C51 Compiler translates C source files into reloadable object modules which contain full symbolic information for debugging with the μ Vision Debugger or an in-circuit emulator. In addition to the object file, the compiler generates a listing file which may optionally include symbol table and cross reference information.

PROTEUS

Proteus PCB design electronic circuits can computer- aided design and circuit boards are designed.

6.3.1 ISIS (Intelligent Schematic Input System)

The ISIS Intelligent Schematic Input System (Intelligent Switching input system), is the environment for the design and simulation of electronic circuits. The component library includes claims more than 10,000 circuit components with 6000 Prospice Simulations models. Own components can be created and added to the library.

ISIS includes a base VSM engine with support for the following functions:

DC / AC voltmeter and ammeter, oscilloscopes, logic analyzers

Analog signal generators, digital pattern generator

Timer functions, protocol analyzers (including RS232, I2C, SPI)

- **VSM (Virtual System Modeling)**

The VSM Virtual System Modeling provides a graphical SPICE circuit simulation and animation directly in the ISIS environment. The SPICE simulator is based on the Berkeley SPICE3F5 model.

It can microprocessor-based systems can be simulated. With the VSM engine can interact during the simulation directly with the circuit. Changes of buttons, switches or potentiometers are queried in real-time and LED indicators, LCD displays, "Hot / Cold" Wires displayed.

Proteus 7.0 is a Virtual System Modeling that combines circuit simulation, animated components and microprocessor models to co-simulate the complete microcontroller based designs. This is the perfect tool for engineers to test their microcontroller designs before constructing a physical prototype in real time. This program allows users to interact with the design using on-screen indicators and/or LED and LCD displays and, if attached to the PC, switches and buttons.

One of the main components of Proteus 7.0 is the Circuit Simulation -- a product that uses a SPICE3f5 analogue simulator kernel combined with an event-driven digital simulator that allow users to utilize any SPICE model by any manufacturer. Proteus VSM comes with extensive debugging features, including breakpoints, single stepping and variable display for a neat design prior to hardware prototyping.

In summary, Proteus 7.0 is the program to use when you want to simulate the interaction between software running on a microcontroller and any analog or digital electronic device connected to it.

CONCLUSION

Overall, an autonomous fire fighting robot has been successfully built. All the fundamental fire fighting action such as moving forward, reverse turn left and turn right function flawlessly. The robot has been able to pick up the condition and stop the fire. Besides that, the robot also has been able to count the maze junction and make its own decision based on the counted junction. Other than that, the robot has been able to turn off the fire. With this ability, the robot can change the current strategy to a new strategy. Other than, the robot also capable to avoid its structure from touching obstacle. As a conclusion, the project entitled "The Fire Fighting Robot" has archived its aim and objective successfully

Studies on Floatation of Waste Mobile Printed Circuit Boards

Sri Sivakumar. T, Gokul. V, Surrendhar. S, Ravikumar. K, Ellamparuthy. G,
Department of Chemical Engineering, Paavai Engineering College, Namakkal, India

ABSTRACT

Vast varieties of appliances which apply electricity are termed as electrical and electronic equipment (EEE). Waste Printed Mobile Circuit Board is a heterogeneous mixture of polymers, ceramic and metals. Characterization of these heterogeneous material is critical in identification of elements present in it. The powdered waste printed circuit boards were investigated by optical stereomicroscope for liberation and shape identification. Flotation studies were conducted to separate metals and nonmetals. The experimental results indicated that the metallic values are enriched in the sink product and polymer were separated from the float. The enrichment of metal values helps in reducing the cost of downstream process such as leaching and extraction of metal values.

Introduction

The electrical and electronic equipment after end-of-life (EoL) period becomes electrical and electronic waste (E-Waste). E-waste is one of the rapid growing solid waste stream in every nation globally [1]. Mobile phones are portable device which receive calls over radio frequency link while the user is around telephone service area. In recent decade mobile phones support various other services such as text message, MMS e-mail, Internet access, short range wireless communications (infrared, Bluetooth), digital photography were commonly defined as featured phones. Mobile phones which offer advanced computing devices are referred as smart phones. Usage of mobile phones worldwide have increases vigorously from 500 million (2000) to 5000 million (2011) [2]. Mobile phone consists of various parts such as case housing, keypad, display, printed circuit boards, battery and charger. The total mobile phone is made up of 50% of polymers and the remaining was made up of other materials such as ceramics and metals [5]. Most of the materials used in mobile phones can be recycled [4]. The polymers used in mobile phones were made of engineering grade polymers such as Polycarbonate (PC), Acrylonitrile-Butadiene-Styrene

(ABS), PC/ABS Blends, and High Impact Polystyrene (HIPS) which can be recycled and reformed into new materials [3]. The major metallic fractions of mobile phones are present in printed circuit boards of the mobile phones. The EoL PCMBs consists of Cu 39.56%, Al 0.31%, Pb 1.17%, Fe 1.42%, Sn 2.09%, Ni 3.42%, Ag 0.06% and Au 0.06%.

Materials and Methods

EoL PCBs are composed of 40% metals, 30% ceramics and 30% polymers. The intrinsic physical and chemical properties of the materials/components of PCBs have many differences than the inherent heterogeneity and complexity. Generally PCBs are made up of several layer of laminate, copper clad laminate, pre-peg and copper foil and other metals. The electrical components are mounted on the top layer of the boards by through whole technology, surface mounting technology. The metal composition comprises mainly of copper, aluminium, iron, zinc, lead, silver, gold, palladium, platinum, nickel, etc. The polymer composition was mainly polyethylene, polypropylene, polyester, polyvinyl chloride, polytetra-fluoroethane and nylon. The ceramic comprises of silicon-di-oxide, aluminium-di-oxide, alkaline and alkaline earth oxides, titanates, mica, etc [6,7]. The lead-free solders are made of tin, bismuth, indium, zinc, copper, silver, antimony, and traces of other metals. The most used lead free solders consist of Tin-Silver and Copper, Lead free solder consists of 99.3% tin, 0.7% copper, 0.05% nickel, and a nominal of 60 ppm germanium. Aluminium is used in heat sink and capacitors, copper is used as copper wires, copper clads/printed circuit board track, and component leads. Germanium in transistors, Ferro-nickel connecting pins coated with gold. Gold in fingers/edge connectors, lead, tin and silver in solders, Zinc in steel plating, iron in steel chassis, cases and fixing.

Flotation is the separation of hydrophilic (mostly metals) and hydrophobic (mostly non-metals) materials from the EoL PCBs. The electronic components embedded on a bare board which was composed of various plastics.

Figure 1: Mobile Phone Circuit Board

In the present work, flotation experiments were carried out by the differences in the degree of hydrophobicity of metals and non-metallic particles would help to separate them from each other. The efficiency of flotation depends on the wettability of plastics. The flotation results of EoL mobile PCBs. The weight % of froth and non-froth products was recorded, and each fraction was analyzed for the grade (metals, ceramics, and plastics).

Result and Discussion

Feed	Product	Yield %	Metal %
Mobile board	Float	67.38	35.60
	Sink	32.62	64.40

Flotation is the separation of hydrophilic and hydrophobic materials. Increase in wettability plastics increase in separation of plastics by flotation. The effective separation of flotation depends on depends on physical properties such as bulk density, particle size, shape, surface energy and surface roughness. The floatation studies of the waste printed circuit mobile boards show that the float contains major polymer with 67% yield and 35% metal recovery. The sink contains majorly metal particles with 32% yield and metal recovery 64%.

Figure 2: Microscopic image of powdered circuit board

Conclusion

The microscopic studies show the presence of metals of irregular shapes such as wires, oval, sphere, rod, etc. The bright images shows the metal particles and the dark images shows the non-metallic particles.

Separation and characterization studies were carried out on EoL mobile PCBs. The size reduction was carried out using a hand pile. Microscopic studies on the powdered waste mobile printed circuit board show the presence of metals of irregular shapes such as wires, oval, sphere, rod, etc.

Flotation studies shows that it is possible to separate hydrophobic plastics and hydrophilic metallic particles. The plastics are naturally hydrophobic and are separated from the top float. The metallic values are hydrophilic and are found in the sink

The enrichment of these metal values reduces the processing cost in extraction of metal values from waste mobile printed circuit boards.

Studies on Production of Pulp and Paper from Sugarcane Bagasse

Logeshwar. K, Mukesh. V, Balaji. R, Hemavathi. R, Gopi. K,

Department of Chemical Engineering, Paavai Engineering College, Namakkal, India

ABSTRACT

Vast varieties of appliances which apply electricity are Paper has multiple purpose in the society by preserving knowledge transformation, communication among peoples, disposable good and eco-friendly product since it can be decomposable easily. The different agricultural waste used in paper production are cotton liners, wheat straw, corn stalk, cotton stalk, banana fruit stem, cereal straw, sugarcane bagasse, etc. Sugarcane (*Saccharum officinarum*) is cultivated in tropical countries. Sugarcane production was 1.84 billion tons in 2017 worldwide. India is the second-highest producer of sugarcane in the world. Bagasse is a fibrous residue remaining after the extraction of the sweet juice from sugarcane. Bagasse consists of 36.3 – 69.4% cellulose, 6 – 30% hemicellulose, 4.4 – 29 % lignin, 0.6 – 5.5 waxes and the rest are ash, saccharose, glucose and silica. In the present work paper was produced from sugarcane bagasse by chemical pulping method and Hydrogen Peroxide is used as a bleaching agent to increase the brightness of the paper. The various characterization techniques of the paper are discussed here to validate the quality of paper.

Introduction

Sugarcane (*Saccharum officinarum*) is cultivated in tropical countries. Sugarcane production was 1.84 billion tons (2017) worldwide. India is the second-highest producer of sugarcane in the world after Brazil. Uttar Pradesh, Karnataka, and Maharashtra together contribute to 80% of the total sugarcane production in India. Sugarcane is a tropical and subtropical crop that requires a hot and humid climate to grow. Sugarcane bagasse is defined as the residue generated after extracting sugar from sugarcane. It consists of 36.3 – 69.4% cellulose, 6 – 30% hemicellulose, 4.4 – 29 % lignin, 0.6 – 5.5 waxes and the rest are ash, saccharose, glucose and silica. The bagasse is used in production of paper for writing, packaging and newsprint purposes. The worldwide pulp and paper industry is gradually

realizing that there is a shortage of the traditional raw material of cellulosic fibers. Bagasse is a fibrous residue remaining after the extraction of the sweet juice from sugarcane (*saccharum officinarum*). Since the inception of sugar industry in the world, this residue has been considered a nuisance and disposal problem with little beneficial uses in many sugar producing countries. Recently, its use as a renewable resource in the manufacture of pulp and paper products, agglomerated boards and building materials among other co-products has become important.

Bagasse has a much lower value for alkyl benzene extraction when compared to other raw materials and hence the presence of wax and resins is much lower in bagasse. Due to this, the presence of pitch is minimized in bagasse pulp. Bagasse has a higher pentosan content when compared to other raw materials. Beta and Gamma Cellulose content is more in bagasse. This ensures good bonding characteristics for bagasse pulp. The lignin content in bagasse is much less than that in bamboo and wood. Hence the chemical requirement for bagasse pulping is much less when compared to that required for bamboo or wood. Significance is the fact that the structure of lignin in bagasse is more open and hence mild cooking conditions are adequate. The hollocellulose content is comparable to that of wood, indicating that the yield will be similar to that of wood based raw materials. The ash content in bagasse is higher than that of wood based raw materials but still much less when compared to straw. Bagasse has several alternate uses which make its availability for paper production a function of changing circumstances.

Agricultural waste for paper production

Cotton linters (*Gossypium hirsutum*) short, cellulose fibers left behind on the cotton seed after the ginning process (removing the cotton staple fibers) is complete. Among all agricultural residues, cotton linters have highest amount of alpha cellulose which is very essential feature for the point of paper production. Sugarcane bagasse (*Saccharum officinarum*) is the outer stalk of sugarcane left after the process of crushing and extraction of sugar from sugarcane. It contains cellulose 55%, lignin 18-24%, Silica 0.7-3 %, Ash 1.5-5%. Among all types of fibers, it is low cost but it have a drawback as it contains pith which causes difficulties during pulp washing and affects quality pulp yield. So, for removing the pith, depithing process is done. Wheat Straw (*Triticum aestivum*) is the by-product of wheat

which left over wheat grains are harvested is used as a raw material for paper production. It consist mainly of cellulose 29-35%, lignin 16-21%, Silica 3-7% and ash 4-6%. Rice Straw (*Oryza sativa*) consists of cellulose (28-36%), Lignin (12-16%), Ash (15- 20%) and Silica (10-15%). Rice straw have certain drawbacks such as high cost, difficult to collect and storage, also contain high content of silica. Due to its abundance appears to be a good material for paper production. Corn stalk (*Zea mays*) stem of a corn plant is used as raw material for paper production. Its average fiber length is about 1.6 mm and average fiber width is about 0.03 mm. Its contain 36-38% cellulose, Lignin 18-19% and few amount of silica and ash. Cotton Stalk (*Gossypium*) as possible source of raw material for papermaking process. When cotton stalk is blended with other pulps, it will produce good quality paper. Banana fruits (*Musa acumintha*) stem can be used as a raw material for the production of paper. It is a cheapest and easily available raw material which is used to prepare the different types of paper such as writing paper, printing paper, tissue paper etc. Its average fiber length is about 1.55 meter, cellulose content 59.3%, lignin 17.5% and few amounts of silica and ash. Cereal straw are also used as a raw material for the production of paper. It includes rye (*Secale cereal*), oat (*Avena sativa*) and barley (*Hordeum vulgare*). From these, rye straw is the best raw material for pulp production due to its availability, greater yield and high strength properties of its pulp.

Paper production process from sugarcane bagasse

Fig.1. Bagasse

Fig.2. Cooked Bagasse

Fig.3. Screening

Fig.4. Pulp Filtration

Fig.5. Paper Produced

The sugarcane is harvested it to be crushed in rotating rollers the sugarcane waste is extracted. Then collect the bagasse from the local juice shop gather all the sugarcane bagasse soak, wash and cut the bagasse into small pieces by cutting scissors. Bagasse was cut into number of pieces it is ready for cooking purpose and cook the bagasse with 10% of baking soda for 1 hour. Sugarcane Bagasse was well-cooked and dried. Bagasse was further grounded to fine particles. The moisture content was removed by treating it in hot oven at 1000 C for 2 hours. Separation of fine grounded bagasse was carried out by manual screening. In the alkylation process the chain bonding is broken down by adding a sodium carbonate (Na_2CO_3) and sodium hydroxide (NaOH) 1:1 ratio into fine bagasse. The sodium carbonate and sodium hydroxide have a high pH, caustic soda allows for the separation of cellulose fibers. Then the fine bagasse is in auto-clave steam method at 3000 C for 3 hours. The cooked bagasse is taken out and filtered with whatman filter paper, the hydrogen peroxide (H_2O_2) is a bleaching agent so it is used to remove the lignin content and it turn

the yellowish color into white. Then the pulp is put into the flat surface thin layer and spraying the starch material for better bonding of paper, and then dry the paper at hot surface after the paper is checking with folding endurance and material strength.

Characterization of paper quality

Basis Weight (Grammage)

The basis weight is defined as the mass of paper per unit area. It is considered a characteristic property in paper production as paper in most cases categorized by its weight. It has the unit of gram per square meter (GSM). It is very important to indicate the strength properties of paper, it is also used to determine the index values of these properties.

pH test

To determine the pH of the paper sheets, 3×3 cm pieces were immersed in 50ml of distilled water for 5h. The pH values of the solutions were then measured with a pH meter.

Thickness and density determination

The thicknesses of paper pieces sized 2×2 cm were determined with an electronic caliper.

Density determination

The pieces were also weighed in an analytical balance. The density of each sample was calculated by formula given below in which d , m , and h are the density (g cm^{-3}), the mass (g), and the thickness (cm) of the sample, respectively.

$$d = \frac{m}{2 * 2 * h}$$

Tensile strength and flexural modulus

Based on ASTM D638 and ASTM D790, the tensile strength and flexural modulus were measured in a universal testing machine. Three paper bands of 2×10 cm for each sample were tested to determine the average values.

Tearing Strength

This test is performed using the Elmendorf-type tearing tester, through which the force perpendicular to the plane of the paper required to tear multiple sheets of paper from a specified distance after the tear has been started is measured. Then the tear strength of a single sheet may be determined. This test is done according to T- 414.

Burst Strength and Burst Index

Based on T- 403, the maximum burst strength is obtained by holding a sheet between clamps and increasing the pressure by a rubber diaphragm maintained under the sheet. The pressure increases until reaching the maximum value that led to rupture of paper. Burst index is calculated by dividing the burst strength by the value of basis weight. It is considered more specific and characteristic for the produced paper.

Conclusion

Sugarcane (*Saccharum officinarum*) is cultivated in tropical countries. India is the second-highest producer of sugarcane in the world after Brazil. Uttar Pradesh, Karnataka, and Maharashtra together contribute to 80% of the total sugarcane production in India. The bagasse is used in production of paper for writing, packaging and newsprint purposes. It contains cellulose 55%, lignin 18-24%, Silica 0.7-3 %, Ash 1.5-5%. Chemical pulp treatment method was adopted to produce pulp from sugarcane bagasse by alkylation process. The pulp was bleached with bleaching agent to increase the brightness of the pulp. The pulp is spread on the paper making die and starch was sprayed over the pulp increase the bonding and strength of the paper. The characterization technique was discussed here and will be carried out future work.

Cellulose-Based Hydrogel Synthesis

Dr. Balaganesh. P, Nishalini. S, Allbright. C, Boobalan. N, Vino. S,

Department of Chemical Engineering , Paavai Engineering College (Autonomous), Namakkal, India

E-mail: nishalinisethumadhavan@gmail.com

Abstract

This paper presents the synthesis and characterization of cellulose-based hydrogels tailored for agricultural use. The hydrogels were synthesized through a facile and environmentally friendly process involving the crosslinking of cellulose with a suitable crosslinker. Various characterization techniques including Fourier transform infrared spectroscopy (FTIR), scanning electron microscopy (SEM), and swelling studies were employed to assess the structural, morphological, and swelling properties of the hydrogels. The impact of different synthesis parameters such as cellulose concentration, crosslinker concentration, and reaction time on the properties of the hydrogels was investigated systematically. The potential of the synthesized hydrogels for agricultural applications, particularly as soil moisture retainers and nutrient carriers, was evaluated through in vitro and in situ studies. The results demonstrate that the cellulose-based hydrogels exhibit excellent water retention capacity and swelling behavior, making them promising candidates for improving soil moisture content and nutrient availability in agricultural settings. This research contributes to the development of sustainable and effective hydrogel-based solutions for enhancing agricultural productivity and sustainability.

Keywords

Cellulose-based hydrogel, synthesis, characterization, agricultural applications, soil moisture retention, nutrient carrier.

Introduction

Background

The agricultural sector faces significant challenges in meeting the growing demand for food while minimizing environmental impact. One critical aspect of sustainable agriculture is the efficient utilization of water resources, especially in regions prone to drought and water scarcity. Hydrogels have emerged as promising materials for enhancing soil moisture

retention and improving crop productivity. Traditional hydrogels, primarily derived from petroleum-based polymers, raise concerns regarding their non-biodegradability and environmental persistence. Hence, there is a pressing need to explore alternative sources for hydrogel synthesis that are renewable and eco-friendly. Cellulose, as the most abundant biopolymer on Earth, presents a compelling option for developing sustainable hydrogels tailored for agricultural applications.

Objective

The primary objective of this study is to synthesize cellulose-based hydrogels optimized for agricultural use. This involves the systematic investigation of cellulose derivatives and crosslinking agents to achieve hydrogels with desirable properties such as water retention capacity, mechanical strength, and biodegradability. Furthermore, the study aims to characterize the synthesized hydrogels using advanced analytical techniques to understand their structural and functional properties. Subsequently, the performance of these hydrogels in agricultural settings will be evaluated through field experiments to assess their efficacy in enhancing soil moisture retention and promoting plant growth.

Significance

The significance of this research lies in its potential to address key challenges in modern agriculture by providing sustainable solutions for soil moisture management and crop productivity enhancement. By leveraging cellulose, a renewable and abundant resource, the synthesized hydrogels offer an eco-friendly alternative to petroleum-based counterparts. Furthermore, the comprehensive characterization of hydrogel properties contributes to the fundamental understanding of structure-property relationships in cellulose-based materials. The findings of this study hold implications for the development of next-generation hydrogel technologies with broad applications in agriculture and beyond.

Figure 1: Effect of hydrogel swelling on soil porosity: (a) dry hydrogel, (b) swollen hydrogel. Adapted from [13].

Materials and Methods

MATERIALS

1. Cellulose: Cellulose obtained from abundantly available renewable source rice husk.
2. Crosslinking Agent: Commonly used crosslinkers include epichlorohydrin and glutaraldehyde.
3. Solvent: Aqueous solution.
4. Plasticizer: Glycerol and polyethylene glycol employed to enhance flexibility.

METHODS

Cellulose Preparation:

- a. Cellulose Extraction: Cellulose fibers were extracted from the source material through physico-chemical means. (Steam treatment and alkaline hydrolysis)
- b. Purification: The extracted cellulose was purified to remove impurities and lignin.
- c. Drying: Purified cellulose was dried to a suitable moisture content.

Hydrogel Synthesis:

Hydrogel Synthesis: a. Dissolution: Cellulose is dissolved in the chosen solvent under controlled conditions, typically through mechanical agitation or heating. b. Crosslinking: Crosslinking agents are added to the cellulose solution, along with catalysts if required, to initiate crosslinking reactions. c. Gelation: The crosslinked cellulose solution undergoes

gelation, forming a hydrogel network. d. Plasticization (Optional): If desired, plasticizers may be incorporated into the hydrogel to modify its mechanical properties.

Hydrogel Characterization: a. Morphology Analysis: Scanning electron microscopy (SEM) is used to examine the surface morphology of the hydrogel. b. Mechanical Testing: The mechanical properties of the hydrogel, such as tensile strength and elasticity, are evaluated using techniques like tensile testing or compression testing. c. Swelling Behavior: The swelling behavior of the hydrogel in water or relevant agricultural solutions is studied to assess its water retention capacity. d. Degradation Studies: The degradation kinetics of the hydrogel are investigated under simulated agricultural condition. Top of Form

Results and discussion

Hydrogel synthesis

The cellulose-based hydrogel was successfully synthesized using a combination of cellulose nanocrystals (CNCs) and a crosslinking agent. The process involved the dispersion of CNCs in a suitable solvent followed by the addition of the crosslinking agent, which initiated the gelation process. The resulting hydrogel exhibited excellent mechanical strength and swelling capacity, making it suitable for various agricultural applications.

Characterization of Hydrogel

- **Morphology Analysis**

Scanning electron microscopy (SEM) analysis revealed the porous structure of the hydrogel, with interconnected pores providing pathways for water absorption and nutrient transportation. The SEM images also indicated the uniform distribution of CNCs within the hydrogel matrix, contributing to its mechanical integrity.

- **Swelling Behavior**

The swelling behavior of the hydrogel was investigated under different pH and temperature conditions. The results showed that the hydrogel exhibited pH-responsive swelling, with maximum

swelling observed at pH values conducive to plant growth. Furthermore, the hydrogel demonstrated temperature-sensitive swelling, with increased swelling at higher temperatures, facilitating water retention in agricultural soils during hot and dry periods.

- **Mechanical properties**

Mechanical testing revealed the robustness of the hydrogel, with high tensile strength and elasticity. These mechanical properties are crucial for maintaining the structural integrity of the hydrogel in various soil conditions, including during tillage operations and root penetration

Water Retention Capacity

The hydrogel exhibited excellent water retention capacity, retaining moisture within the soil and reducing water loss through evaporation. This property is particularly beneficial for agricultural applications in arid and semi-arid regions, where water scarcity is a significant challenge for crop production. The enhanced water availability in the root zone promotes seed germination, root growth, and overall plant development, leading to increased crop yields.

Nutrient Absorption and Release

The porous structure of the hydrogel facilitated the absorption and retention of nutrients within its matrix. This feature enables the controlled release of nutrients to plant roots over an extended period, ensuring optimal nutrient uptake and utilization by crops. Additionally, the hydrogel can adsorb certain pollutants and heavy metals from the soil, thereby improving soil quality and mitigating environmental contamination.

Biodegradability and Environmental Impact

The cellulose-based hydrogel is biodegradable and environmentally friendly, minimizing its ecological footprint compared to synthetic polymer-based hydrogels. Upon degradation, the hydrogel releases cellulose oligomers, which serve as carbon sources for soil microorganisms, promoting soil health and fertility. The use of sustainable materials in hydrogel synthesis aligns with the principles of green chemistry and sustainable agriculture, contributing to long-term environmental sustainability.

Field Trials and Agronomic Performance

Field trials were conducted to evaluate the agronomic performance of crops grown in soil treated with the cellulose-based hydrogel. The results demonstrated significant improvements in crop growth, yield, and water use efficiency compared to untreated control plots. The hydrogel-treated soil maintained optimal moisture levels throughout the growing season, reducing the need for irrigation and conserving water resources. Additionally, the

controlled release of nutrients from the hydrogel enhanced nutrient uptake by plants, resulting in healthier and more vigorous crops

Economic Viability and Practical Considerations

The economic viability of implementing cellulose based hydrogels in agriculture depends on various factors, including the cost of raw materials, production scale, and market demand. However, the potential benefits, such as increased crop yields, water savings, and improved soil health, justify the investment in hydrogel technology for sustainable agriculture practices. Furthermore, the scalability of hydrogel production and its compatibility with existing agricultural practices make it a practical solution for farmers seeking to enhance productivity while minimizing environmental impact.

Future Directions and Challenges

Despite the promising results obtained in this study, several challenges and opportunities exist for further research and development of cellulose-based hydrogels for agricultural applications. Future investigations could focus on optimizing hydrogel formulations for specific soil types and crop varieties, as well as exploring novel techniques for enhancing nutrient release kinetics and biodegradability. Additionally, interdisciplinary collaborations between scientists, engineers, and agricultural practitioners are essential for advancing hydrogel technology and facilitating its adoption in real-world farming scenarios.

Conclusion

In conclusion, the synthesis of cellulose-based hydrogels holds immense promise for agricultural applications, offering sustainable solutions to various challenges faced by the industry. Through this project, we have demonstrated the feasibility and efficacy of utilizing cellulose as a fundamental component in hydrogel formulations, harnessing its unique properties to address key agricultural needs.

The successful synthesis of cellulose-based hydrogels marks a significant milestone in the quest for environmentally friendly agricultural technologies. By employing cellulose, a renewable and biodegradable polymer, as the primary building block, our hydrogels offer a

sustainable alternative to conventional agricultural materials. This aligns with the growing demand for eco-friendly solutions that minimize environmental impact and promote sustainability in farming practices.

One of the primary advantages of cellulose-based hydrogels is their exceptional water retention capacity. Through the incorporation of cellulose fibers or derivatives, our hydrogels can absorb and

retain large volumes of water, mitigating drought stress and enhancing water availability for crops. This property is particularly crucial in arid and semi-arid regions, where water scarcity poses a significant challenge to agricultural productivity. By improving soil moisture content and reducing irrigation frequency, cellulose-based hydrogels contribute to more efficient water use and sustainable crop production.

Moreover, the biocompatibility and biodegradability of cellulose-based hydrogels ensure minimal environmental impact and compatibility with existing agricultural practices. Unlike synthetic polymers, cellulose-based hydrogels degrade naturally over time, releasing harmless byproducts into the soil. This feature not only reduces the accumulation of non-biodegradable waste but also promotes soil health and fertility, fostering long-term sustainability in agriculture.

In addition to water retention, cellulose-based hydrogels offer other beneficial properties that can enhance soil quality and crop growth. These hydrogels can act as carriers for nutrients, fertilizers, and agrochemicals, facilitating their controlled release into the root zone. By optimizing nutrient uptake and minimizing leaching, cellulose-based hydrogels promote efficient nutrient utilization and reduce environmental pollution associated with conventional fertilization practices.

ABSTRACT

Vitamins are very essential for human beings. It mostly supplied by diets. Vitamins are classified into fat soluble and water soluble. Accordingly they are called Vitamin A, D, E, K and B-complex vitamins respectively. Among those Vitamin B-Complex content was estimated from different sources like chicken egg, buffalo milk and goat milk and compared with each other to predict which of these sources having high content of vitamin B-complexes by thin layer chromatography, Spectrofluorophotometry quantitatively and qualitative analysis done by HPLC methods. Finally, cyanocobalamin (Vitamin B12) was enormously found in all the mentioned sources among all B-complex vitamins which was predicted by TLC. Quantitative analysis was done by spectrofluorophotometric method to estimate cyanocobalamin (Vitamin B-12) and it was found only egg mixed (both white and yolk) sample 2 contains high quantity of cyanocobalamin (Vitamin B- 12). Then Qualitative analysis was done to predict whether the content present in egg mixed (both white and yolk) sample 2 was cyanocobalamin (Vitamin B-12) by comparing with standard. It was concluded the cyanocobalamin (Vitamin B-12) was abundant in egg mixed (both white and yolk) sample 2 and revealed whole chicken egg will replace or supplement for cyanocobalamin (Vitamin B-12) which is essential as human diet.

KEY WORDS

B-complex Vitamins, cyanocobalamin (Vitamin B-12), TLC, Spectrofluorophotometry, HPLC

INTRODUCTION

Vitamins in milk can play an important part in helping to meet daily nutritional requirements. Many of us take vitamin supplements to help round out our diets, but it's well-recognized that vitamins act synergistically, [1-3] and offer more benefits when obtained through food sources. The B vitamins are water soluble and play an important role in cell metabolism in the body, including regulating metabolism, maintaining healthy skin and muscle tone, enhancing the immune and nervous system function and promoting cell growth. When consumed in food, the B vitamins have also been linked to a reduced risk of pancreatic cancer, one of the most deadly forms of cancer. The B vitamins are yet another important component of the overall composition of vitamins in milk. Among the B vitamins, goat milk significantly exceeds cow's milk as a source of niacin (by 350%) and B6 (by 25%). Goat milk is lower, however, in folic acid and B12. [12-13] Despite criticism of these shortcomings, the lower values are actually much closer to those found in human milk for infants, than is cow's milk. Remaining B group, thiamine, riboflavin, pantothenic acid and biotin, values are comparable to those of cow's milk. Buffalo's milk is a rich source of Riboflavin and Vitamin B12. Vitamin A, C and Thiamin are also found in good amounts. Small amounts of Folate, Pantothenic Acid, Vitamin B6 and Niacin are also found in Buffalo's milk. [12-13]

Calorie Content of Buffalo's Milk: 100g of Buffalo's Milk has 97 calories. Calories from fat are 61.

The vitamins are classified as water soluble and fat soluble as shown in fig 1 chart.

Figure 1: Flow chart for classification of vitamins.

Vitamin B12 or cyanocobalamin is produced by microorganisms in animals, and does not occur Naturally in plant foods. It is important in three enzymatic reactions: the conversion of (1) homocysteine into methionine; (2) L- methylmalonyl CoA to succinyl CoA; and (3) the formation of leucine aminomutase. Little Vitamin B12 is lost through urine or feces; most is excreted into bile and then re-absorbed in the ileum. A deficiency occurs if absorption is impaired (e.g., with doses of 500 mg or more of Vitamin C), or after many years on a strict vegan diet, and results in megaloblastic anemia and neuropathy. Sport- caught fish are among the best dietary sources of Vitamin B12; e.g., rainbow trout, Coho, salmon and channel catfish (6.3 ug, 5 ug, and 2.9 ug per 100 gram portions, respectively) provide more than beef (2.57 ug), pork (1.06 ug), [7]chicken (0.34 ug), or egg (1.10 ug). [14-16]

MATERIALS AND METHODS

Collection of chicken egg, Buffalo milk and Goat milk:

To analyze high content of Vitamin-B-complex presence in different sources such as chicken egg Buffalo milk and goat milk were collected in Vellore, Tamilnadu, India. The B-complex vitamins were analyzed by TLC method, Spectrofluorophotometric method and HPLC methods. [4-6]

By Thin layer chromatographic method: (Separation of B-Complex vitamins)

The TLC plate used was silcagel coated thin glass plate. It acts as stationary phase. To estimate high content of B-complex vitamins present in chicken egg, buffalo milk and goat milk the solvent used as n-propanol: n butanol: water: ammonia in the ratio of 7:5:1: 2 respectively which acted as mobile phase. [22]. Chicken egg was taken and its white and yellow yolk taken separately in each of the centrifuge tubes and marked as egg white sample 1 and egg yolk sample 3, similarly, egg mixed (both white and yolk) sample 2 was taken in another centrifuge tube and buffalo milk was taken and marked as Buffalo milk sample 1 and in another centrifuge tube, goat milk sample was taken and marked as goat milk sample 2. Likewise 5 different samples were taken separately in each of the centrifuge tubes. Next, following procedure was performed to extract or isolate B-complex vitamins from all the samples. Samples were centrifuged at maximum speed for 15 mints. Then discarded the supernatant and cell pellet was taken. To that added 5 ml of phosphate saline buffer at pH 7.0 then centrifuged at maximum speed for 15 mint`s again. Then discarded the supernatant

and cell pellet was taken. Next Sonicate for 10 minutes by adding 5 ml of phosphate saline buffer at pH 7.0 was performed. Then centrifuged at maximum speed for 15 min't's. The supernatant was taken for TLC elution. After the above procedure was completed, 2 micro liters of all the five samples & standard (B-complex vitamins) were taken and spot in TLC plate and kept in elution tank contained mobile phase. After 1 -2 hr. the plate was taken out and illuminated under UV -light to visualize the separated vitamins from five samples and compared with standard Among the B- complex vitamins only cyanocobalamin (Vitamin B12) content presence Rf value was equal to samples Rf value. This means, only this vitamin content quantity was very high in all the samples. So further Spectrofluorophotometric method was performed to confirm cyanocobalamin (Vitamin B12) content in all the five samples.

By Spectro fluoro photometric method

This method involves the spectral analysis of cyanocobalamin (Vitamin B12) excitation wavelengths measured at 361 nm and emission wavelengths measured at 550 nm and quantitative analysis of cyanocobalamin (Vitamin B12) at wavelength of 361-550nm nm was performed. [16].

- **Quantitative analysis**

The procedure involved as follows:

- Prepared 5 mg of standard cyanocobalamin (HIMEDIA) solution in 5 ml Of distilled water and taking at various concentrations of 0.2 , 0.4, 0.6, 0.8, 1.0 in micro gram / ml.
- Filled a quartz cuvette 2/3 full with cyanocobalamin solution, and place this sample in the cuvette holder.
- Set the instrument in quantitative analysis and wavelength kept at 440 - 550 nm.
- Observing excitation peaks at 361 nm and emission peaks at 550 nm for standard cyanocobalamin as mentioned above in different concentrations in microgram / ml.
- Record the observed fluorescent intensity of emitted data.
- Then, 0.4 microgram of each of the five samples were taken such that egg white sample 1, buffalo milk sample 1, egg mixed (both white and yolk) sample 2, egg yolk sample 3, goat milk sample 2 and steps from 2-5 above was followed.

- Plotted the standard graph for Cyanocobalamin, fluorescent intensity against concentration of cyanocobalamin in micro gram / ml.
- From the standard graph obtained, the unknown concentration of cyanocobalamin content of all the five samples was calculated.
- Among all the five samples only egg mixed (both white and yolk) sample 2 which having high concentration of Cyanocobalamine, so to analyze qualitatively by HPLC method was followed to compare the retention time of egg mixed (both white and yolk) sample 2 cyanocobalamin content with standard.

By HPLC Method – Qualitative Analysis of Cyanocobalamine:

An HPLC (High performance liquid chromatography) method has been developed to determine cyanocobalamin content in egg mixed (both white and yolk) sample 2. Standard cyanocobalamin was prepared by taking 5mg in 5ml of D. water.

The HPLC system of Shimadzu consisted of a C8 column, a solvent system of 0.1 % Benzene - Acetic acid – Water in the ratio of (1 : 2 : 7 v/v) ; and the sample flow rate of 0.1 ml / min was injected . The UV-detector wave length was kept at 361 – 550 nm, [16] because cyanocobalamin was detected at this particular wavelength range.

Then, from the chromatogram obtained, Retention time was observed for egg mixed (both white and yolk) sample 2 injected and compared with standard Cyanocobalamine. [14-15]

RESULTS AND DISCUSSION

By Thin layer chromatographic methods:

The B-Complex vitamins were analyzed as shown in fig 2 and fig 3 by thin layer chromatographic methods which were available in chicken egg, buffalo milk and goat milk. To analyze the B- complex vitamins content the solvent used were as follows:

n -propanol: n-butanol: Water: ammonia

7 : 5 : 1: 2

Rf value =
$$\frac{\text{Distance travelled by the solute front (in cm)}}{\text{Distance travelled by the solvent front (in cm)}}$$

Figure 2: TLC plates showing standards

1-Riboflavin; 2-Pyridoxine; 3-Thiamine; 4-Folic acid; 5-Cyanocobalamin

Figure 3: TLC plates showing samples

a- chicken egg white sample 1; b- buffalo milk sample 1; c- goat milk sample 2; d- chicken egg mixed (both white and yolk) sample 2; e- chicken egg yolk sample 3

Rf value for the standard:

Rf value for the standard cyanocobalamin

$$5.2 / 7.5 = 0.69$$

Rf value for the standard Thiamine

$$4.7 / 7.5 = 0.62$$

Rf value for the standard Riboflavin

$$4.4 / 7.5 = 0.58$$

Rf value for the standard Folic acid

$$4.9 / 7.5 = 0.65$$

Rf value for the standard Pyridoxine

$$4.2 / 7.5 = 0.56$$

Rf value for the Samples

Rf value for the egg white sample 1

$$5.2 / 7.5 = 0.69$$

Rf value for the Buffalo milk sample 1

$$5.2 / 7.5 = 0.69$$

Rf value for egg mixed(both white and yolk) Sample 2

$$5.2 / 7.5 = 0.69$$

Rf value for the egg yolk sample 3

$$5.2 / 7.5 = 0.69$$

Rf value for the goat`s milk sample 2

$$5.2 / 7.5 = 0.69$$

Compared with Rf values of standards all the sample`s Rf values viz., egg white sample 1, buffalo milk sample 1, egg mixed (both white and yolk) sample 2, egg yolk sample 3, goat milk sample 2 having high content of only B-complex (Cyanocobalamine) vitamin B12.

Table 1: Quantification of cyanocobalamin vitamin by Spectro fluoro photometry method (@ 361-550nm)

Name	Fluorescent intensity of emission data (FI)	Concentration of Vitamin B12 (µ gm / ml)
Standard (Cyanocobalamin) - 01	069 .10	0.6
Standard - 02	210 .55	0.8
Standard - 03	272 .14	1.0
Standard - 04	322 .17	1.5
Standard - 05	494 .02	2.0
Egg white sample 1	354.18	0.42
Buffalo milk sample 1	290.22	0.39
Egg mixed(both white and yolk) sample 2	326.98	0.95
Egg yolk sample 3	366 .41	0.52

Goat milk sample 2	395.52	0.48
--------------------	--------	------

Figure 4: Shows quantity of Vitamin B12 content in each samples

From the pie chart shown above in fig 4, the percentage of high quantity of cyanocobalamin (Vitamin B12) producing samples was Egg mixed (Both white and yolk) sample-2.

By HPLC - Qualitative Analysis of Cyanocobalamin:

After the result obtained from Spectrofluorophotometry, further HPLC method to determine the cyanocobalamin content from egg mixed (both white and yolk) sample-2 was analyzed qualitatively by HPLC method.

Figure 5: Chromatogram shows for standard cyanocobalamin (HIMEDIA)

Figure 6: Chromatogram shows for egg mixed (both white and yolk) sample-2

From the chromatogram obtained by HPLC method, retention time of standard and both the samples were same. This reveals cyanocobalamin (vitamin-B12) content in egg mixed (both white and yolk) sample-2 as shown in fig 5 and fig 6

CONCLUSION

Cyanocobalamin (Vitamin B12) is very essential for human in case of neuron regeneration and many more. In this study of research, estimation of quantity of cyanocobalamin content was analyzed in different sources such that chicken egg, buffalo milk, and goat milk, and various sophisticated instruments were used and finally revealed egg mixed (both white and yolk) sample 2 contains high content of Vitamin B12 and so that consumption of chicken whole egg will help to generate cyanocobalamin and it will cure many diseases and act as a supplement for cyanocobalamin (vitamin B12).

ACKNOWLEDGEMENT

We are grateful and full of gratitude to the School of Biotechnology and Chemical Engineering, VIT-UNIVERSITY, Vellore, INDIA for using sophisticated instruments to carry out this research work.

Making of Bioplastic from pectin by citrus peels

Dr. Balasubramani. K, Dinesh.P, Jegan. V, Sabharinathan. K, Sandhiya. P,

*Department of Chemical Engineering , Paavai Engineering College (Autonomous),
Namakkal, India.*

Abstract

This research paper investigates the feasibility and sustainable synthesis of bioplastics from pectin extracted from citrus peels. With the growing concern over environmental pollution and the depletion of fossil fuel resources, there is a pressing need to explore renewable and biodegradable alternatives to conventional plastics. Citrus peels, a major byproduct of the citrus processing industry, contain substantial amounts of pectin, a polysaccharide known for its gelling and thickening properties. In this study, citrus peels were collected, processed, and subjected to pectin extraction using environmentally benign methods. The extracted pectin was then utilized as a precursor for the synthesis of bioplastics through a series of chemical and physical treatments. The properties of the resulting bioplastic films, including mechanical strength, thermal stability, and biodegradability, were characterized using various analytical techniques. Additionally, the environmental impact of the bioplastic production process was assessed through a life cycle analysis. This research contributes to the development of eco-friendly alternatives to traditional plastics, paving the way towards a more sustainable future.

Introduction

Background

Plastics, once hailed for their versatility and contributions to technology and medicine, have now become a global environmental concern due to their extensive consumption and persistent pollution. Governments worldwide, including India's, are intensifying efforts to address plastic waste's detrimental impacts on ecosystems and human health. Amidst this crisis, the quest for sustainable alternatives has gained momentum, with bioplastics emerging as promising solutions.

Utilizing agricultural waste, such as citrus peels, for bioplastic production has garnered attention due to its potential to mitigate plastic pollution and promote circular economy

principles. Recent research has demonstrated successful conversion of citrus peels into bioplastics, leveraging their rich content of pectin and other natural compounds. These bioplastics offer comparable properties to conventional plastics but with lower environmental impact and greater biodegradability.

Figure 1: Citrus peels

Objective

The objective of producing bioplastic from citrus peels encompasses several key aims. First and foremost is the sustainable utilization of agricultural waste. Citrus peels, typically discarded in large quantities, present an opportunity for resource optimization and waste reduction. By converting these peels into bioplastic, we aim to contribute to a circular economy model, where waste is minimized, and resources are efficiently utilized. Moreover, utilizing citrus peels as a raw material for bioplastic production aligns with the principles of renewable resource utilization. Unlike traditional plastics derived from fossil fuels, citrus peels offer a renewable and abundant source, reducing our reliance on finite resources and mitigating environmental degradation. Importantly, the bioplastic derived from citrus peels is inherently biodegradable, addressing concerns surrounding plastic pollution and offering a sustainable alternative. From an economic perspective, assessing the viability of this approach involves considerations of cost-effectiveness, scalability, and market demand for eco-friendly alternatives. Research and innovation are crucial for optimizing processes and properties, ensuring the environmental benefits of citrus peel-derived bioplastics are maximized. Through comprehensive environmental sustainability and economic feasibility in the realm of bioplastic product.

Materials and methods

Materials

- Citrus Peels
- Hydrochloric Acid (Hcl)
- Sodium hydroxide (Naoh)
- Ethanol
- Glycerol (plasticizer)
- Glutaraldehyde (cross-linking agent)

Preparation

To prepare them for bioplastic production, the peels underwent a meticulous cleaning process, thoroughly washed to remove any external impurities or contaminants. Following cleaning, the peels were subjected to a drying process, either through air-drying or low-temperature oven drying methods, effectively reducing their moisture content to facilitate subsequent extraction procedures. Once adequately dried, the orange peels were finely ground or shredded to increase the surface area for extraction, enhancing the efficiency of pectin retrieval. This processed fruit waste, rich in pectin content, formed the cornerstone of bioplastic production, underscoring the sustainable utilization of agricultural by-products in the quest for eco-friendly materials.

The production process for making bioplastic from pectin extracted from citrus peels involves several sequential steps aimed at transforming this natural polymer into a usable material for various applications. Initially, pectin is extracted from citrus peels through a process of hot acid extraction followed by precipitation with alcohol, resulting in a purified and concentrated form suitable for bioplastic production. Subsequently, the extracted pectin is formulated with other ingredients such as plasticizers and cross-linking agents to create a homogeneous mixture.

This formulation is then heated and mixed to create a molten bioplastic melt, which is poured into molds of desired shapes and sizes. After cooling and solidification, the bioplastic products are subjected to post-processing steps such as trimming and surface finishing to enhance their properties and appearance. Throughout the production process, stringent quality control measures are implemented to ensure the consistency and integrity of the

bioplastic products, including testing for mechanical properties, thermal stability, and biodegradability. Overall, this process offers a sustainable alternative to conventional plastics derived from fossil fuels, utilizing citrus peel waste as a valuable resource for eco-friendly material production.

Results and discussions

Biodegradation, water and oil permeability test

The biodegradation of the developed plastic was carried out according to the soil burial method. Pre weighed films of weight 0.5 g chopped and were noted as an initial weight before soiling conditions and placed in the beakers at a depth of 5 cm from the mud surface. One of the film samples was sprinkled with water to study moisture content's effect on the sample's degradation, while the other was without moisture. These two samples kept observed over for one month.

Day	Sample weight (g) without moisture A	% Weight loss with respect to initial weight (0.5 g)	Sample weight (g) with moisture B	% Weight loss with respect to initial weight (0.5 g)
1	0.5000	00	0.5000	00
2	0.4626	7.48	0.4428	11.44
3	0.4312	13.76	0.4166	16.68

Fourier transform infrared spectroscopy (FTIR)

The bio-based material sample dissolved in chloroform was spread as a smear upon NaCl block. The samples were subjected to FTIR analysis in the range 450–4000 cm^{-1} using a Spectrum 2 FT-IR/SP 10. To study the chemical interactions between the chemicals, The resolution of the spectrum was 1 cm^{-1} with the scan rate of 100 scans per seconds.

Thermogravimetric analysis (TGA)

TGA of orange peel plastic was done using SDT Q600 Instrument. Thermogravimetric analysis was performed under an artificial air atmosphere. Approximately 6.56 mg (350 mg,

including sample holder) sample was loaded to a platinum crucible and heated from ambient temperature to 600 °C.

Temperature degree Celsius	% weight loss
52.75	6.80
91.05	10.79
177.8	21.86

Mechanical analysis

The tensile test was conducted by following ASTM 882-2: tensile properties of thin plastic sheeting. Cross head speed was kept to 0.5 mm/ min Micro tensile universal testing machine, and the size of the sample analyzed was 40 × 50 × 0.2 mm. The tensile tests indicate the force required to break the bioderived plastic and also the extent of sample stretch and elongation up to breaking point. Which helps in the determination of mechanical strength bear by the sample.

Sample	Maximum tensile strength (MPa)	Tensile Modulus/Modulus of Elasticity (N/mm ²)
Orange peel plastic (A1)	7.38	25.33

Conclusion

The production of bioplastic from citrus peels offers a promising avenue for addressing both environmental and economic challenges associated with conventional plastics. By harnessing citrus peels as a renewable and abundant resource, this approach contributes to sustainable resource utilization and waste reduction. The inherent biodegradability of citrus peel-derived bioplastic also offers a solution to the pervasive issue of plastic pollution, aligning with broader efforts to promote environmental sustainability. Furthermore, exploring the economic viability of this initiative underscores its potential to not only mitigate environmental impact but also create economic opportunities through innovation

and market demand for eco-friendly alternatives. Moving forward, continued research, development, and collaboration will be essential for optimizing processes, properties, and scalability, ensuring that bioplastic from citrus peels realizes its full potential as a sustainable and commercially viable alternative to traditional plastics.

The utilization of citrus peels for bioplastic production represents a significant step towards a more sustainable future. By converting agricultural waste into a valuable resource, we address the pressing issues of waste management and resource scarcity. The inherent biodegradability of citrus peel-derived bioplastic offers a tangible solution to the persistent problem of plastic pollution, reducing the burden on our ecosystems and oceans.

Moreover, the economic feasibility of this approach opens up new avenues for green innovation and investment, fostering a transition towards a circular economy model. As we continue to refine and scale up production processes, collaboration between industries, academia, and policymakers will be vital to ensure the widespread adoption of citrus peel-based bioplastics. Ultimately, by embracing this innovative approach, we can create a more sustainable, resilient, and environmentally conscious future for generations to come.

PREPARATION OF FACE SERUM FROM NIGELLA SATIVA (BLACK CUMIN) SEED OIL

Abstract

The utilization of essential oils derived from *Nigella Sativa*, commonly known as black seed oil, has gained significant importance in the formulation of cosmetics. With its rich history and remarkable therapeutic properties, *Nigella Sativa* oil has become a key ingredient in the beauty and skincare industry. This introduction will delve into the crucial role this natural oil plays in the preparation of face serums, highlighting its numerous benefits and its growing popularity among consumers seeking healthier and more radiant skin. In the realm of cosmetic science and skincare formulation, the incorporation of essential oils extracted from *Nigella Sativa*, colloquially known as black seed oil, has garnered substantial attention and importance. Renowned for its diverse and potent phytochemical composition, *Nigella Sativa* oil has emerged as a pivotal component in the formulation of advanced face serums. This aims to delve into the pivotal role this botanical extract plays in the preparation of these skincare products, elucidating its multifaceted benefits, and underscoring its burgeoning acclaim among discerning consumers seeking dermatological enhancements. Within the empire of advanced cosmetic chemistry and dermal science, the strategic utilization of essential oils meticulously derived from *Nigella Sativa*, commonly referred to as black cumin oil, has risen to eminence as an indispensable facet of face serum preparation. The integration of essential oils derived from *Nigella Sativa*, commonly known as black cumin oil, has assumed an increasingly pivotal role. The applications of *Nigella Sativa* oil in the cosmetic sector are as diverse as they are transformative, with formulations that cater to skin nourishment.

Keywords

Nigella Sativa seed oil, face serum, skincare, Soxhlet extraction, Simple distillation

Introduction

In recent years, there has been a growing interest in natural remedies and botanical extracts for skincare. *Nigella sativa*, commonly known as black seed or black cumin, is one

such botanical treasure that has been revered for its therapeutic properties for centuries. The essential oil derived from *Nigella sativa* seeds is rich in bioactive compounds known for their antioxidant, anti-inflammatory, and antimicrobial properties, making it a promising ingredient for skincare formulations. The skincare industry is witnessing a growing trend towards natural and personalized skincare solutions. *Nigella Sativa* seed oil, renowned for its skin-enhancing properties, presents an opportunity for formulating effective face serums. This research aims to explore the preparation of a face serum incorporating *Nigella Sativa* seed oil along with other skincare ingredients such as glycerin, salicylic acid, and niacinamide. The utilization of Soxhlet extraction and distillation techniques ensures the extraction and purification of active compounds for optimal efficacy. A serum is a type of skincare product that typically contains a gel or lightweight lotion with a moisturizing consistency. One of the primary benefits of a serum is its ability to penetrate deeper into the skin to deliver active ingredients. A good skin serum can provide numerous benefits to your skin, including a firmer, smoother texture, smaller pores, and increased moisture levels. Due to their lightweight consistency, serums are often used as a first layer of skincare before applying heavier moisturizers or creams. Additionally, serums can be customized to target specific skin concerns, such as hyperpigmentation, fine lines, or acne. Incorporating a serum into your daily skincare routine can help enhance the efficacy of your skincare products and improve the overall health and appearance of your skin. In addition to formulation development, this project will evaluate the skin benefits of the *Nigella sativa* essential oil face serum through in vitro and in vivo studies. In vitro assays, such as antioxidant and anti-inflammatory assays, will provide insights into the oil's mechanisms of action at the cellular level. Meanwhile, in vivo studies involving human volunteers will assess the serum's efficacy in improving skin hydration, elasticity, tone, and texture through clinical measurements and subjective evaluations. Furthermore, this project aims to explore the potential synergistic effects of combining *Nigella sativa* essential oil with other botanical extracts or active ingredients commonly used in skincare formulations. By understanding how these ingredients interact and complement each other, we can enhance the overall efficacy of the face serum and offer consumers a holistic solution for their skincare needs. In summary, this project represents a comprehensive investigation into the skin benefits of *Nigella sativa* essential oil and its potential application in skincare formulations. By

harnessing the power of nature and scientific innovation, we aim to develop a natural and effective face serum that promotes healthy, radiant skin for all.

Materials and Methods

Materials Required:

- **Nigella Sativa Seed Essential Oil:**
Known for its moisturizing and anti-inflammatory properties.
- **Glycerin:**
A humectant aiding in moisture retention.
- **Salicylic Acid:**
An exfoliating agent beneficial for acne-prone skin.
- **Niacinamide (Vitamin B3):**
Supports skin barrier function and reduces redness.

Techniques:

Drying :

The acquired seeds underwent a drying process to eliminate any existing moisture.

Following this, they were ground into powder, and hexane extraction was employed to isolate the phytochemical components. Subsequently, the mixture underwent simple distillation to separate the seed oil and remove the extraction solvent. Cold maceration with methanol was then utilized in the extraction process.

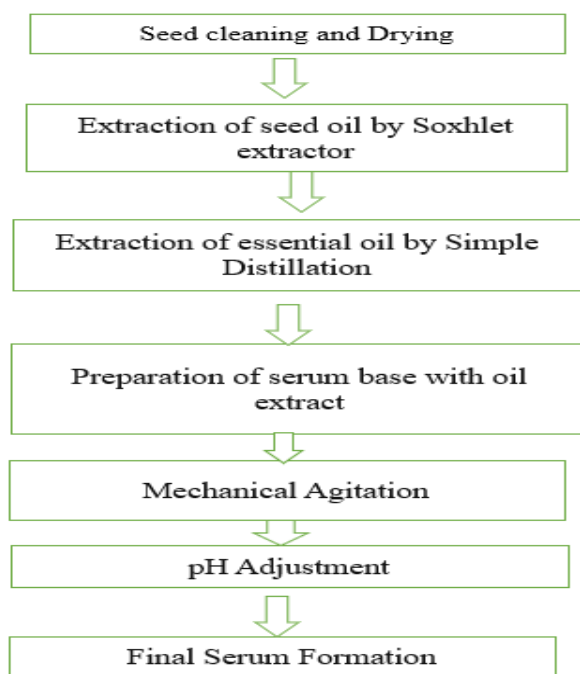

Soxhlet Extraction: Utilized for exhaustive extraction of thermally stable analytes. Continuous cycling of extraction solvent through the matrix ensures efficient extraction of desired compounds.

Simple Distillation: Employed for the separation of liquids based on their boiling points. The distillation process involves heating the mixture, condensing the vapours, and collecting the distillate.

Physical Evaluation :

SN O	PROPERTIES	OBSERVATIO N
1	Colour	Pale yellow

2	Odour	Characteristics odour
3	Taste	Tasteless
4	Texture	Moderate viscous
5	Homogeneity	Good
6	pH	5.8

Results

The preparation of the face serum involved the extraction of active compounds from *Nigella Sativa* seeds using Soxhlet extraction. Subsequent distillation facilitated the purification of the extracted oil. The formulated serum exhibited desirable characteristics, including moisturization, exfoliation, and skin barrier support, attributed to the synergistic effects of the ingredients utilized.

Discussion

The successful formulation of the face serum underscores the potential of *Nigella Sativa* seed oil in skincare applications. The incorporation of glycerin, salicylic acid, and niacinamide complements the moisturizing, exfoliating, and barrier-enhancing properties of the serum, catering to various skin types and concerns. Further studies are warranted to evaluate the long-term efficacy and safety profile of the formulated serum through clinical trials and consumer feedback.

Physical appearance: Serum formulation was light yellow in color, viscous liquid preparation with a smooth homogenous texture and glossy appearance. pH: The pH of the formulation was found 5.8. As the skin has an acidic pH of around 4.1-6.7, this range of formulations is suitable for all skin types.

Conclusion

In conclusion, the preparation of a face serum from *Nigella Sativa* seed oil, utilizing Soxhlet extraction and distillation techniques, demonstrates promise as a natural and personalized skincare solution. The formulated serum offers potential benefits in moisturization, exfoliation, and skin barrier support, contributing to healthier and rejuvenated skin. Continued research and development in this area can pave the way for innovative skincare formulations catering to diverse consumer needs. The aim of this report was to study what exactly are facial serums and their history along with their overall importance. The study includes its proper selection and correct sequence of application. With a tremendous amount of serums available in the market for each and every skin type and skin problem these days, it's essential for one to know what they are looking for in a serum precisely. When a righteous formulation is selected by scrutinizing every major skin issue, it is safe to say that significant improvements can be seen, leading to good results. Skin health is a crucial element of the altogether health of the body and having a proper skin care routine with an accurate serum for you, can sustain the ageing skin and ward off the ongoing damage. It eliminates fine lines, wrinkles, dark spots, and further blemishes if paired with appropriate moisturizer and sunscreen. Specific ingredients deal with a certain skin concern, as a result a combination of all the finest ingredients could show miraculous benefits. The report also shows numerous skin care brands for serums

ABSTRACT

This paper explores the repurposing of industrial waste as sustainable building materials, specifically for pre-cast applications in the construction industry. With a growing emphasis on sustainable practices, the study investigates the viability of utilizing industrial by-products to create environmentally friendly and economically viable alternatives to conventional construction materials.

With the ever-increasing demand for Ordinary Portland Cement (OPC) due to global urbanization, construction industry is faced with two major challenges – (1) scarcity of natural resources for raw materials, and (2) significantly higher contribution to environmental pollution due to CO₂ emission during cement manufacture. This paper aims at increasing the awareness about the possibility of using industrial waste products as substitutes for OPC and natural aggregates in concrete formulation. In addition to iron slag and copper slag as aggregates, alkali activated alumino-silicate waste products such as fly ash and Ground Granulated Blast-furnace Slag (GGBS) can be used as the binder for generating sustainable building material. As of now alkali activated alumino-silicates are approved (IS: 17452 – 2020) in various proportions for pre-cast applications.

However, here we report that activation of GGBS with Sodium silicate alone, in the absence of corrosive Sodium hydroxide, can generate strong, and durable high quality binding materials, free from efflorescence, for extended applications. Cube compressive strength of this concrete varied from 20 MPa to 70 MPa for various mix proportions ranging from 1:4:8 to 1:1.5:3 by weight. Due to the specific shape and thickness, 100mm paver blocks

made with conventional aggregates demonstrated strength about 20 to 50% higher than the corresponding 'grade of concrete' used for its production. Field trials conducted since 2018 had proven durability even after multiple exposures to extreme weather conditions and physical stress, for the past four years. In conclusion, we have demonstrated that GGBS can be repurposed in construction industry as a replacement for OPC with added advantage in terms of field applicability, durability, and low cost.

Keywords

GGBS, Geopolymer concrete, Alkali activated concrete, Pre-cast applications, Waste utilization, Sustainable development and Concrete blocks.

INTRODUCTION

The two major problems faced world over is waste management and reducing carbon emission. The solutions to these burning issues are multi prong. In construction industry cement is an un avoidable binder material. Concrete is such a wonderful building material that its per capita consumption is one tone per annum, next only to water. For making cement concrete we need cement, aggregates and water. Cement industry makes use of natural resources like lime stone, clay, silica etc. Production of cement is highly energy intensive and about 7% world's total CO₂ emission is the contribution of cement industry. Quarrying of stone poses many environmental issues. We are facing the dearth for natural resources, energy intensive operations and emission of CO₂ on one side and accumulation of industrial waste on the other side. This investigation is about finding substitutes for cement and aggregates making use of industrial waste materials like GGBS, iron slag and copper slag without compromising on strength, durability, economy and ease of use.

Currently there is a dearth for conventional crushed stone aggregates. Lime stone reserve is also getting depleted due to cement manufacture. IS 456-2000 stipulates the quality of water using for making of concrete as potable grade. Quality and quantity of water available for concrete production is also becoming a problem. Much more quantity of water is required for curing than it is required for making concrete. All these issues are faced by construction industry individually and collectively at different parts of the world apart from other environmental issues thereof.

This study is about suitability of using iron and copper slag as aggregate with alkali activated binder made using GGBS. GGBS is activated by user friendly alkali sodium silicate. This study target fully replacing cement and partially the

conventional aggregates for pre-cast applications. IS 383-2016 permits 50% replacement of conventional coarse aggregate by crushed iron slag aggregate for plain concrete and 100% replacement for lean concrete. Similarly, replacement of fine aggregate using copper slag is permissible by 40% for plain concrete and 50% replacement for lean concrete. However, in this study it was found that 100% replacement of coarse aggregate by crushed iron slag and 50% replacement of fine aggregate by crushed copper slag yielded fairly good strength making it suitable for all pre-cast applications. IS 17452-2020 permits use of alkali activated binders for pre-cast applications.

LITERATURE REVIEW

The In our earlier study sodium silicate alone was used as activator solution. Mix of fly ash and GGBS was used as binders. Maximum strength was obtained when GGBS alone used as binder[1]. Hence in this study GGBS alone was used as binder material. Studies by replacement of fine aggregate from 0 to 100% using copper slag in fly ash-based heat cured Geopolymer showed increase in compressive strength compared to conventional fine aggregate[2]. In fly ash-GGBS based Geopolymer concrete, cured at ambient temperature, 40% replacement of fine aggregate with copper slag performed higher in compressive strength, split tensile strength, flexural strength and density, but water absorption and sorptivity was high. Modulus of elasticity and bond strength was lower[3]. Similar study based on fly ash-GGBS has also shown significant increase in density and compressive strength, when 40% of fine aggregate was replaced with copper slag [4]. Studies with heat cured fly ash based Geopolymer with copper slag as coarse aggregate and crusher dust as fine aggregate keeping their content constant found that the compressive strength depends on composition of alkaline solution and curing temperature[5]. Replacing 60 to 80% fine aggregate by a mix of copper slag and marble dust marginally improved the engineering properties of Geopolymer concrete[6]. In fly ash based Geopolymer, when iron slag was used as 100% substitute for coarse aggregate the compressive strength increased by 6%[7]. Full replacement of coarse aggregate by steel slag in Fly ash-GGBS based geopolymer could

attain marginally lower compressive, flexural strength and split tensile strength. When treated with 1% sulphuric acid and 5% sodium sulphate for 30 days, reduction in strength was found marginally lower than un-treated samples[8]. Studies on compressive strength, split tensile strength and flexural strength of Geopolymer concrete using fly ash showed optimum improvement with 30% replacement of coarse aggregate with steel slag[9]. In all these studies either fly ash or a combination of fly ash-GGBS was used as binder material. When fly ash alone was used, heat curing regime was adopted. The alkaline solution used in all the cases was a mixture of sodium silicate and sodium hydroxide. Copper slag was generally used as fine aggregate and Iron or steel slag was used as coarse aggregate. Combination of iron slag and copper slag is seldom done. Air cooled blast furnace slag when used as replacement of fine aggregate in cement-based mortar and concrete varying from 25 to 100%, it was found that results of pull-off strength, compressive strength, sorptivity, water absorption, porosity, and total charge passed in Rapid Chloride Penetration Test (RCPT), at par with use of conventional fine aggregate [10].

In this study we have used only GGBS as binder powder and sodium silicate as activator solution based on our

previous study. Full replacement of coarse aggregate by iron slag and 50% replacement of fine aggregate by copper slag was adopted.

MATERIALS AND METHODS

The raw materials used as binder is a mix of GGBS with sodium silicate as alkaline activator maintaining binder powder to sodium silicate ratio 0.50. Water to binder solids ratio was maintained constant at 0.30 in all the trials by adding extra water. Material characterization details are given in our earlier study[1]. The coarse aggregate used is crushed iron slag without grading, as such it was received from iron industries in Kanjikode, Kerala. The fine aggregate used was crushed copper slag received from Cochin ship yard Ltd, Kochi and locally available crushed stone sand in 1:1 proportion. The physical properties of aggregates are given in Table 1.

Mix design was done based on our previous study [1]. From that study 4 proportions 1:4:8, 1:3:6, 1:2:4 and 1:1.5:3 was adopted. While designing alkali activated concrete using GGBS, crushed iron slag as coarse aggregate and crushed

Material	Specific Gravity	Bulk Density(Loose) in Kg/m ³	Void Ratio(Loose)	Porosity in % (Loose)
CA	2.76	1319	1.03	50.70
MS	2.61	1700	0.44	30.52
IS	2.71	1320	1.00	50
CS	3.50	2160	0.67	40

Table 1 Physical properties of aggregates

Copper slag as fine aggregate, it was found that more quantity of fine aggregate was required to fill the voids. The specific gravity of crushed stone aggregate and iron slag aggregate is almost equal. The specific gravity of copper slag (3.5) is much higher than that of iron slag, broken stone or crushed stone sand. When ingredients were taken in weight proportion, due to the higher specific gravity, the volume of copper slag per unit weight was less to fill the voids in iron slag coarse aggregate. Due to this, supplementary quantity of crushed stone sand was required, equal in weight of the copper slag used as fine aggregate to completely fill the voids in coarse aggregate. For two parts of coarse aggregate one part copper slag and one-part crushed stone sand was used as fine aggregates. For cubic meter of concrete the binder contents varied as 150, 200, 300 and 400 kg depending on proportion. The aggregates used per cubic meter of concrete are coarse aggregate 1200 kg, fine aggregate in a combination of 600 kg copper slag and 600 kg crushed stone sand. Due to above reasons the density of concrete made using iron slag and copper slag as aggregate was higher than that of concrete made using conventional aggregates for all mix proportions (Figure 1).

The mix design notations shown in Table 2 indicate CA: conventional crushed stone coarse aggregate, IS: Crushed iron slag coarse aggregate, MS: Crushed stone manufactured sand fine aggregate (M.Sand), CS: Crushed copper slag fine aggregate and GG: Ground granulated blast furnace slag (GGBS). Numeric values given in subscript indicate the proportion by weight. Numeric digits (150,200,300,400) along with mix designation indicate the quantity of GGBS used per cubic meter of concrete. In mix number (C) denotes mix with conventional aggregate and (A) denotes alternate aggregates.

Mixing of aggregates and GGBS was done in dry condition in a drum mixer initially for 2 minutes and alkaline solution was poured while in rotation and continued mixing for another 3 minutes and delivered the concrete to wheel barrow after attaining uniform

consistency. The mix was very harsh and less cohesive with lower workability, though it contained equal quantities of fine and coarse aggregates. This is mainly due the irregular shape of iron slag and copper slag. The concrete was placed immediately in to the moulds in three layers and each layer was compacted on vibration table for 20 seconds. The setting occurred within 8 hours and was demoulded after 36 hours. Specimens were kept at ambient indoor temperature (25 to 32 degree Celsius) for respective curing period and was tested under room dry condition without any water curing. Compressive strength testing was done at respective age with 2000 kN compression testing machine with 10kN least count. The compressive strength attained for the alkali activate concrete mixes using conventional aggregate in our previous study [1] was compared with similar concrete using alternate aggregate with identical quantities of GGBS and sodium silicate binder (Figure 2). The minimum (Min) and maximum (Max) values obtained for three samples are shown separately.

RESULTS AND DISCUSSION

The compressive strength obtained for alkali activated concrete using crushed iron slag as 100% replacement of coarse aggregate and crushed copper slag as partial replacement of fine aggregate (along with M.Sand in the ratio 1:1) was compared with alkali activated concrete made with conventional crushed stone aggregate for identical quantities of binder. In general, it was found that when slag was used as aggregate, there was a reduction in compressive strength for about 35 % for lower binder content (150 and 200 kg/m³). At higher binder content (300 and 400 kg/m³) the reduction in compressive strength was about 15%. Paver blocks of 100 mm thickness made with conventional aggregates exhibited about 20 to 50% higher compressive strength compared to cube compressive strength for identical thickness. When alternate aggregates were used for 100mm thick paver blocks the compressive strength obtained was slightly lower than the corresponding grade of concrete by which it is made up. In the economic analysis in our previous study[1], it was found that alkali activated concrete is cheaper than conventional concrete for grades up to M40 and slightly higher for M40 to M70 grades of concrete. When crushed iron slag and copper slag are used as coarse and fine aggregates even though there is reduction in compressive strength with identical mix with conventional aggregates, it is comparable with cement concrete in terms of strength and economy. The density of alkali activated concrete using alternate aggregate was higher than that was made using conventional crushed stone aggregate. This is mainly because of higher specific gravity of copper slag being used as fine aggregate.

Table 3 Summary of compressive strength and densities of alkali activated concrete with conventional aggregate (C) and alternate aggregates (A)

CONCLUSION

Alkali activated concrete can be used as substitute for cement concrete for all plain concrete pre-cast applications.

Crushed iron slag and copper slag can be used as substitutes for conventional crushed stone aggregates.

Use of industrial wastes like GGBS, iron and copper slag will reduce embodied energy and CO₂ emission in construction industry minimizing environmental hazards and saving many natural resources.

Alkali activated concrete uses very little water for its manufacturing and no water for curing.

Alkali activated concrete is a suitable material for highway construction.

FUTURE SCOPE

Crushed iron slag can be tried as alternate fine aggregate.

Crushed copper slag can be tried as substitute for coarse aggregate.

Use of fly ash in combination with GGBS can be tried while making alkali activated concrete using alternate aggregates.

The economic studies for particular location and savings in embodied energy and reduction in CO₂ emission is worth analyzing for considerations as green building product.

INTRODUCTION

Cities have paved over natural green spaces to make way for streets, homes, and commercial developments. Urban stormwater can be defined as the extreme runoff from pervious and impervious surfaces that include roofs, driveways, pavements, footpaths, and roads infrastructure characteristic of urban areas. In the developed urban areas, roof surface areas account for 40–50% of all total impervious surface areas. Also, climate change has caused more frequent and intense storms. The effects of global warming because of climate change is already increasing vulnerability of several urban areas around the world, through raising sea levels, inland floods, more frequent droughts, periods of increased heat, and the spread of diseases. Due to climate change and urbanization stormwater runoff rates, volumes and pollution are getting more and more increased. Technologies of stormwater management (SWM) systems need to be improved to account for the changes in the hydrologic cycle that results from urbanization and changes of runoff caused by climate changes. Approaches to stormwater management known as ‘Sustainable (Urban) Drainage systems’ (SUDS), ‘Low Impact Development’ (LID), or ‘Best Management Practices’ (BMPs), represent a diverse range of control procedures, which integrate stormwater quality and quantity control as well as enabling social and amenity perspectives to be incorporated into stormwater management approaches. For example, the aim of LIDs include: treating stormwater as close to the source as possible, decreasing impervious area, and implementing systems that have multiple functions (i.e. attenuating peak flow rates, storage of

precipitation, delay of stormwater generation, infiltration, filtration, enhancing aesthetics, improve ecology) . The implementation of a stormwater control as a retrofit on vacant roofs could significantly reduce the impervious surface cover and help decrease stormwater runoff and pollution generation at the source.

GREEN ROOF DESIGN IMPLEMENTATION

The goals of stormwater system design, is typically to preserve groundwater, prevent geomorphic changes in waterways, prevent flooding risks, protect water quality, and maintain aquatic life . New SWM techniques are designed to maximize stormwater runoff reduction and provide flow rate control. A green roof system is a vegetative layer grown as an extension of an existing roof. It is built on new and existing roof structures which need to be prepared to fit this special purpose. For example, it needs to have a good waterproofing and root repellent system; it needs to include a drainage layer and a filter cloth, a mulch layer and lightweight growing medium and plants (Figure 1). Typically, a green roof design consists of three layers: vegetation, substrate (growth media) and drainage .

Each layer of the conventional green roof system (Figure 1) has an important function.

Vegetation Layer: The vegetation will reduce wind erosion, provide shading for the substrate, and reduce the temperature during daylight hours in the warm season. Transpiration restores water storage capacity to the media, and the canopy can provide interception storage. Plant selection in most cases should be restricted to native varieties of grasses.

Growing Media (substrate): An engineered substrate generally consisting of sand, gravel, crushed rock and some organics. The substrates main purpose is to store excess rainfall and support plant life. Standard soils are not used because they are too heavy for roof structures and a calculated ratio of aggregate, organic materials, air and water is used.

Drainage Layer: A synthetic mat or a layer of porous media that permits conveyance of excess precipitation to outlets and roof drains. **Water Proofing Membrane:** The first layer directly above the conventional surface. Insulation should be placed above or below the water proofing membrane, as well as a root barrier to stop root invasion. The green roof can be classified depending on the depth of the substrate layer and can be named as extensive roofs and intensive roofs . Table 1 summarizes the attributes of the extensive and intensive green roofs Site conditions such as annual precipitation, sun exposure, periods of drought, frost or snow and building structure (additional load, slope of roof, wind), in addition to owner preferences, are used to determine whether an intensive or extensive roof should be installed. Using an appropriate design which integrates different technical options can prove useful to increase the efficiency of green roofs in different regions and under different climatic conditions . The 'Guidelines for the Planning, Construction and Maintenance of

Green Roofing’ contain relevant regulatory information on the construction and maintenance of different types of green roof systems.

METHODOLOGY AND SUMMERY OF THE PROJECT

- Select the type of green roof.
- Methodology of selected green roof.
- Problem identification of selected green roof.
- What are the implementation and improvement ideology of selected green roofs?
- Construction components of selected green roof technology.
- Requirement making.
- Green roof design and building the technology.
- Testing and plotting result.

BUILD: IMPLEMENT THE GREEN ROOF CONSTRUCTION PLAN AND PROVIDE INITIAL NURTURING:

The build phase has several layers ... literally. A little soil and a few plants aren’t going to cut it up on a roof, after all. In order to protect the building envelope and keep plants happy, green roofs must include:

- A waterproofing membrane to protect the roof
- A root barrier to keep the membrane sound
- A drainage and water retention mat to catch water that filters through plants
- A filtration system
- A growing medium for the plants
- Plants themselves, specifically chosen for their suitability to the climate, intended use and type of green roof (e.g. intensive, with deeper growing media and a wider plant array, or extensive, with shallower growing matrix and more utilitarian species)
- Although some companies will tell you your green roof is “finished” as soon as they roll out that final sedum groundcover or plant the last lavender, that’s usually not the case. A quality green roofing company will then walk the client through the finished project, get approval, make changes as necessary.

- But even that's not all. The final part of the build phase is a monitoring period to ensure plants are establishing properly and the roof is overall performing as expected.
- From there, it's time to transition.

TYPES OF GREEN ROOFS

Green roofs are internationally placed in three different ‘types’: Of course there is some cross over between the categories.

- Intensive – parks and gardens including Urban Agriculture.
- Semi-intensive – garden green roofs.
- Extensive – natural low maintenance green roofs.

Table: General Features of the Green Roof IMPROVED ENERGY PERFORMANCE THROUGH THERMAL

Energy performance is a key benefit of green roofs. Whilst green roofs are ;

W= Water, T= Thermal, B= Biodiversity,
A= Amenity

Type	Extensive	Semi-intensive	Intensive

Weight	60-150 kg/m ²	120-200 kg/m ²	180-500 kg/m ²
Cost	Low	Periodic	High
Use	Ecological Landscape	Garden/Ecological Landscape	Garden/Park
Type of vegetation	Moss-Herbs-Grasses	Grass-Herbs-Shrubs	Lawn/Perennials, Shrubs, Trees
Benefit	W,T,B	W,T,B,A	W,T,B,A
Depth of Substrate	60-200mm	120-250mm	150-400mm
Cost	Low	Periodic	High

Load Bearing

One of the main considerations of a green roof is its load bearing capacity. Intensive green roofs, with increased layers and ability to retain large amounts of water, make this consideration especially important. It also makes retrofitting an existing structure with a green roof more expensive than designing a green roof into a new building

Abstract

The construction industry uses more resources and produces more waste than any other industrial sector; sustainable development depends on the reduction of both, while providing for a growing global population. The reuse of existing building components could support this goal. The experimental analysis conducted in this study focuses on the utilization of recycled construction and demolition (C&D) waste as a partial replacement for coarse aggregates in concrete. The study aims to investigate the feasibility of incorporating C&D waste into concrete mixes to reduce the demand for natural resources while addressing waste management concerns. Various tests were conducted to evaluate the mechanical properties and workability of concrete mixes containing recycled C&D waste aggregates. The results indicate the potential for achieving comparable performance to conventional concrete mixes, highlighting the viability of utilizing recycled materials in sustainable construction practices.

Keywords

Construction and demolition (C&D) waste, concrete.

INTRODUCTION

The requirements of the country are rapidly increasing with increase in the growth of the industries. Construction industry being the back bone of all other industries, concrete has emerged as one of the most important material in the developing world. Being in the chart

of highest consumed, concrete production relies on the availability of cement, sand and coarse aggregate in a concrete mix the most commonly used fine aggregate is natural sand obtained from river. Due to the shortage of raw materials the growth rate of construction field is adversely affected in almost all part of country.

The main objective of our project is to use the construction and demolishing waste as an alternative material for coarse aggregate in concrete. The waste generated as a result of demolishing of old structures or as a result of construction of the structures is generally known as construction and demolishing waste. Since past few decades the quantum of this waste is one of the largest streams produced globally. The construction industry generates a significant volume of waste, with construction and demolition (C&D) activities contributing to a substantial portion of this waste stream.

In response to the growing environmental concerns associated with waste disposal and the depletion of natural resources, there has been increasing interest in exploring alternative materials for use in construction applications. One promising approach is the utilization of recycled C&D waste as a substitute for conventional aggregates in concrete production.

EXPERIMENTAL INVESTIGATION

General

Concrete is one of the most commonly used materials in the field of construction. The main ingredients of concrete mix are aggregate, sand, cement and water. In Our study oyster shell was partially replaced up to certain percentages for fine aggregate in a self-compacting concrete.

Materials Used

Cement

Fine Aggregate

Oyster Shell

Coarse aggregate

Water

Polycarboxylate Ether

Cement

A cement is a binder, a substance used in construction that sets and hardens and can bind other materials together. The most important types of cement are used as a component in the production of mortar in masonry and of concrete which is combination of cement an aggregate to for mast strong building material. Cement used in construction are usually inorganic often lime based and be characterized as being either hydraulic or non-hydraulic, depending upon the ability of the cement to set in the presence of water. Portland cement is manufactured by crushing, milling and proportioning of Lime or calcium oxide, Silica, SiO₂.

Aggregate

Aggregate is natural deposit of sand and gravel and also give structure to the concrete. It occupies almost 75% to 80% of volume in concrete and hence shows influence on various properties such as workability, durability, and economy of concrete. To increase the density of concrete aggregate is frequently use in different sizes.

Fine Aggregate

Aggregate that pass through a 4.75 mm IS sieve and having not more than 5% coarse material are known as fine aggregate. Main function of this fine aggregate is to fill voids in between coarse particles and also helps in producing workability and uniformity in mixture. Sand is used for the experimental program was locally procured and confirmed to Indian Standard specifications IS 383-1970. Fine aggregate test was as per IS 2386- 1963.

Coarse Aggregate

The aggregate having size more than 4.75 mm is termed as coarse aggregate. The graded coarse aggregate was described by its nominal size i.e. 40mm, 20mm, 10mm, 4.75mm etc. The coarse aggregate used was a normal weight aggregate with a maximum size of 20mm and 10mm was obtained and it was tested in accordance with IS 2386- 1963.

C & D Waste

The waste generated as a result of demolishing of old structures or as a result of construction of the structures is generally known as construction and demolishing waste. Since past few decades the quantum of this waste is one of the largest streams produced globally. The construction industry generates a significant volume of waste, with construction and demolition (C&D) activities contributing to a substantial portion of this waste stream.

Figure 1: Construction & Demolition waste

Water

Water plays important role everywhere. Here too water is very essential for mixing. Amount of water to be is very much important. Too much water leads to lack of binding property, too less of water leads to lack of consistency. Water is added as per water cement ratio.

TEST ON MATERIALS

Tests on cement

Specific Gravity Test:

Initially the empty dry density bottle was weighed and taken as w1.

Then the bottle is filled with cement and it was weighed as w2.

The density bottle can be dried and then it was filled with part of cement and kerosene and it was weighed as w3.

The density bottle was filled up to the top with kerosene and weighed as w4.

Weight of empty flask (W1) = 30g

Weight of flask + cement (W2) = 80g

Weight of flask + cement + kerosene (W3)= 162g

Weight of flask + kerosene(W4) =132g Specific gravity = $\frac{w2-w1}{(w2-w1)-(w3-w4)} \times 0.79$

Specific gravity of cement = 3.16

Fineness test:

About 100g of cement was taken on an IS 90 μ sieve.

The air set lumps in the sample were broken with fingers. The sample was continuously sieved giving circular and vertical motion for about 15 minutes.

The residue left on the sieve was weighed.

The weight shall not exceed 10% for ordinary cement.

Weight of cement taken (w1) = 100g

Weight of cement retained (w2) = 7g

Percentage cement retained = $(w2/w1) \times 100 = 7/100 \times 100 = 7\%$

Fineness of cement = 7%

Consistency test:

500g of cement was taken and made into with a weighed quantity of water (% by weight of cement).

The paste was prepared in a standard manner and filled into Vicat's mould.

Now the vicat plunger is slowly brought down to touch the surface of the paste and quickly released.

The depth of penetration of the plunger was noted.

Table 1: Consistency Test Tabulation

Sl. No	Weight of the cement	% of water	Quantity of water (ml)	Penetration Index reading (mm)
1	500	25	125	12
2	500	27	135	10
3	500	29	145	7

Consistency of the cement paste is 29%

Initial and final setting time:

The needle of the vicat apparatus was lowered gently and it was brought in contact with the surface of the test block and quickly released. Then it was allowed to penetrate into the test block. In the beginning, there will completely pierce through the test block after some time when the paste starts losing its plasticity. The needle may penetrate only to a depth of 33-35mm from the top.

Table 2: Cement Setting Time Tabulation

Sl. No	Time Elapsed (Min)	Scale Reading (mm)
1.	7	2
2.	17	4
3.	33	5

Initial setting time of cement is 30min. Final setting time of cement is 10 hours.

Tests on fine aggregates

Specific Gravity:

Initially the empty pycnometer was weighed and taken as w1.

Then the pycnometer is filled with fine aggregate and it was weighed as w2.

The pycnometer can be drained and then it was filled with part of aggregate and water and it was weighed as w3.

Then the pycnometer was filled up to the top with water and weighed as w4.

Weight of pycnometer(w1) = 552g

Weight of pycnometer + sand (w2)= 1552g

Weight of pycnometer + Weight of sand+ water(w3) = 1992g

Weight of pycnometer + water (w4) = 1365g

Specific gravity of fine aggregate, $G = (w2-w1) / ((w2-w1)-(w3-w4))$

Specific gravity of fine aggregate= 2.68

Figure 2: Laboratory tests

Figure 3

Tests on coarse aggregates

Sieve analysis:

- The sample was brought to an air-dry condition by drying at room temperature.
- The required 1kg quantity of sample was taken.
- The sieves are placed in the order of size with larger sieve on the top in mechanical sieve shaker.
- Sieving was done for 10 minutes.
- Then the material retained on each sieve after shaking represents the fraction of the aggregate coarser than the sieve considered and finer than the sieve above.
- The weight of the aggregate retained in each sieve was weighed and converted to total sample.
- Fineness modulus was determined as the ratio of summation of the cumulative percentage of weight retained on each sieve and dividing it by arbitrary number 100.

Table 3: Sieve Analysis Tabulation

S N o	Sieve size (mm)	Weight retaine d on sieve (gm)	% of weig ht retai ned	Cumulative	
				% Retai ned	% Passi ng
1	4.75	12	1.2	1.0	99.0
2	2.36	21.5	2.15	3.30	96.70
3	1.18	140. 5	14.05	17.0	83.0
4	600 μ	318. 5	31.85	49.0	51.0
5	300 μ	409. 0	40.9	90	10
6	150 μ	86.5	8.65	97	3
7	Pan	12	1.2	100	0
				TOTAL =357	

Fineness modulus =3.57

Tests on fresh concrete

To determine workability of fresh concrete the following tests were conducted.

Slump cone test

Compaction factor test

Flow table test

Slump cone test:

- The concrete slump test which is used to measure the consistency of fresh concrete before it sets.
- The fresh concrete is filled in frustum cone with height of 300mm, top and bottom diameter is 200mm & 100mm respectively.
- The workability of fresh concrete was measured by means of the conventional slump test as per IS 1199:1989.
- The test is very useful on site as a check on the day- to-day or hour- hour variation in the materials being fed into the mixer.

Figure 4: Slump Cone test

Height of cone = 300mm

Bottom of cone = 200mm

Top of cone = 100mm

Height of subsided concrete = 140mm

Slump value = $300 - 140 = 160\text{mm}$

Flow table test:

- Flow table test for measuring the workability of fresh concrete.
- The mould filled with concrete in two layers and each layer is rodded 25 times with a tamping rod.
- The mould removed from concrete and fixed with flow table in vertically.
- Switch on the flow table after spread on the concrete in the table.
- The spread on the concrete to be measured.
- Flow percent = $\frac{\text{spread diameter} - 25}{25} \times 10 = \frac{(40 - 25)}{25} \times 100$

The flow percent of concrete is 60%

Figure 5: Fresh concrete tests

Compaction factor test:

- Compaction factor test which is used to find the workability of concrete.
- The test was carried out with an apparatus of two conical hoppers each hopper has a Hinged flame with a quick release and cylinder.
- Weight of the Container was 4kilogram.

Table 4: Compaction Factor Tabulation

S. No	w/C ratio	Mass with partially compacted concrete (w2) kg	Mass with fully compacted concrete (w3)kg	(W2-W1) kg	(W3-W1) kg	C.F= (W2-W1)/(W3-W1)
1.	0.5	19.56	20.56	15.56	16.56	0.93
2.	0.6	20.12	21.34	16.12	17.34	0.92
3.	0.7	21.34	22.12	17.34	18.12	0.95

From the above tabulation, compaction factor of the concrete was found to be 0.95

MIX DESIGN

Step 1 - Determining the Target Strength for Mix Proportioning

$F'_{ck} = f_{ck} + 1.65 \times S$ Where,

F'_{ck} = Target average compressive strength at 28 days F_{ck} = Characteristic compressive strength at 28 days

S = Assumed standard deviation in $N/mm^2 = 5$ (as per table -1 of IS 10262- 2009)

$= 30 + 1.65 \times 5.0 = 38.25 N/mm^2$

Step 2 - Selection of water-cement ratio: -

From Table 5 of IS 456, Maximum water-cement ratio = 0.50.

Step 3 - Selection of Water Content

Maximum water content for 20 mm aggregate = 186 Kg (for 25 to 50 slump)

We are targeting a slump of 100mm,

we need to increase water content by 3% for every 25mm above 50 mm i.e. increase 6% for 100mm slump Estimated water content for 100 Slump = $186 + (6/100) \times 186 = 197$ liters.

Water content = 197 liters

Step 4 - Calculation of Cement Content

Water-Cement Ratio = 0.43

Cement Content = Water content / "w-c ratio" = $(197/0.43) = 458$ kgs

Step 5 - Volume of Coarse Aggregate and Fine aggregate Content

Volume of coarse aggregate corresponding to 20 mm size and fine aggregate (Zone II) = 0.62

Volume of coarse aggregate = $0.62 \times 0.9 = 0.56$

Volume of fine aggregate = $1 - 0.56 = 0.44$

Step 6 - Estimation of Concrete Mix Calculations

Volume of concrete = 1 m³

Volume of cement = $(\text{Mass of cement} / \text{Specific gravity of cement}) \times (1/100) = (458/3.15) \times (1/1000) = 0.14$ m³

Volume of water = $(\text{Mass of water} / \text{Specific gravity of water}) \times (1/1000) = (197/1) \times (1/1000) = 0.197$ m³ Total Volume of Aggregates = $1 - (b+c) = 1 - (0.14+0.197) = 0.663$ m³

Mass of coarse aggregates = $d \times \text{Volume of Coarse Aggregate} \times \text{Specific Gravity of Coarse Aggregate} \times 1000 = 0.663 \times 0.56 \times 2.70 \times 1000 = 1002$ kgs/m³

Mass of fine aggregates = $d \times \text{Volume of Fine Aggregate} \times \text{Specific Gravity of Coarse Aggregate} \times 1000 = 0.663 \times 0.44 \times 2.70 \times 1000 = 788$ kgs/m³

Mix Proportion:

Cement = 458 kg/m³ Water = 197 ltr

Fine aggregate = 788 kg/m³ Coarse aggregate = 1002 kg/m³ Water-cement ratio = 0.43

For Per Cube:

Volume of cube = $0.15 \times 0.15 \times 0.15 = 0.003375$

Water = 660g

Cement = $458 \times 0.003375 = 1.5$ kg

Fine aggregates = 2.65 kg Coarse aggregate = 3.38kg

MIX RATIO = 1: 1.7: 2.1

MIX DESIGN REPLACEMENT

Step 1 - Target strength for mix proportioning

$f'_{ck} = f_{ck} + 1.65 s$

where f'_{ck} = target average compressive strength at 28 days,

f_{ck} = characteristic compressive strength at 28 days, and

s = standard deviation. standard deviation, $s = 5 \text{ N/mm}^2$

Therefore, target strength $= 30 + 1.65 \times 5 = 38.25 \text{ N/mm}^2$

Step 2 - Selection of water-cement ratio

Maximum water-cement ratio = 0.45.

Based on experience, adopt water-cement ratio as 0.43.

$0.43 < 0.45$, hence O.K.

Step 3 - Selection of water content

Maximum water content for 20 mm aggregate = 186 liter (for 25 to 50 mm slump range)

Estimated water content for 100 mm slump

$= 186 + (6/100) \times 186 = 197 \text{ liter}$

As superplasticizer is used, the water content reduced up 28 percent.

$= 197 \times (28/100) = 55.16$
 $= 197 - 55.16$

Water Content = 141.84 litres

Step 4 - Calculation of cement content

Water-cement ratio = 0.43

Cement content = $141 / 0.43 = 330 \text{ kg/m}^3$

Step 5 - Volume of coarse and fine aggregate content

Volume of coarse aggregate = $0.62 \times 0.9 = 0.56$. Volume of fine aggregate content = $1 - 0.56 = 0.44$.

Step 6 - Mix calculations

Volume of concrete - 1 m^3

Volume of cement - Mass of cement / Specific gravity of cement $\times 1 / 1000 = 330 / 3.15 \times 1 / 1000 = 0.10 \text{ m}^3$

Volume of water - (Mass of water / Specific gravity of water) $\times (1 / 1000) = (141.84 / 1) \times (1 / 1000) = 0.141 \text{ m}^3$

Volume of chemical admixture - Mass of chemical admixture / Specific Gravity $\times (1 / 1000)$

Mass of chemical admixture = Cement $\times 2 \text{ percent} / 100 = 330 \times 2 / 100 = 6.6$

Volume of chemical admixture = $6.6 / 1.11 \times 1 / 1000 = 0.00594$

Volume of all in aggregate - $[1 - (b + c + d)] = [1 - (0.10 + 0.141 + 0.00594)] = 0.75 \text{ m}^3$

Mass of coarse aggregate = $f \times \text{Vol of CA} \times \text{Specific Gravity} \times 1000 = 0.75 \times 0.56 \times 2.7 \times 1000$
 = 1134kg

Mass of fine aggregate = $f \times \text{Vol of FA} \times \text{Specific Gravity} \times 1000 = 0.75 \times 0.44 \times 2.7 \times 1000$
 = 891kg

Replacing Coarse Aggregate:(10, 20, 30 Percentage)

For 10%

= $1134 \times 10 / 100 = 113.4\text{kg}$ (C&D Waste)

Therefore, $1134 - 113.4 = 1020.6\text{ kg}$ (CA)

For 20%

$1134 \times 20 / 100 = 226.8\text{kg}$ (C&D Waste)

Therefore, $1134 - 226.8 = 907.2\text{kg}$ (CA)

For 30%

$1134 \times 30 / 100 = 340.20\text{kg}$ (C&D Waste)

Therefore, $1134 - 340.20 = 793.8\text{kg}$ (Sand)

Mix Proportion

- Cement = 330 kg/m³
- Water = 141.84 liter
- Fine aggregates = 891 kg/m³
- Coarse aggregate = 1134 kg/m³

For 10% = 1020.6 kg/m³

For 20% = 907.2 kg /m³

For 30% = 793.8 kg/m³

- C & D Waste

For 10% = 113.4kg

For 20% = 226.8kg

For 30% = 340.2kg

MIX RATIO = 1: 2.7: 3.4

TESTS ON HAREDENED CONCRETE

Compressive strength test:

For cube specimens testing of Concrete, 150mm×150mm×150mm size cubes were used.

The cubes were tested by using universal testing machine at the age of 7, 14 and 28 days of curing and evaluated as per IS 516 – 1959.

Compressive strength= P/A

Compressive strength is considered to be the outstanding property of concrete.

The data presented here shows the compressive strength of oyster shell concrete

It also shows the decrease in compressive strength with increase in water cement ratio.

Table 5: Tabulation of Compressive strength (N/mm²)

Curing Days	Conventional Concrete	Replaced Concrete		
		10%	20%	30%
7 days	18.57	17.32	19.54	17.32
14 days	26.76	24.72	28.87	22.35
28 days	31.22	29.23	32.08	27.75

Split tensile strength Test:

For split tensile strength of concrete, 150mm diameter and 300mm height cylinders were used.

The split tensile strength on cylinder was conducted on a universal testing machine.

The method covers the determination of the splitting tensile strength of cylindrical concrete specimens.

This method consists of applying a diametric compressive force along a length of a cylindrical specimen.

This loading includes tensile stresses on the plane containing the applied load.

Split tensile strength= $2p/3.14 \times d$

Table 6: Tabulation of Split tensile strength (N/mm²)

Curing Days	Conventional Concrete	Replaced Concrete		
		10%	20%	30%
7 days	2.56	2.85	3.17	3.07
14 days	3.12	3.35	3.54	3.31
28 days	3.89	3.95	4.22	4.12

CONCLUSION

Based on this experimental study, it is concluded that the mix can be made by replacing C & D waste for coarse aggregate without decreasing strength. 20% of replacement of C & D waste for coarse aggregate has produced maximum compressive strength and split tensile strength. The comparative with ordinary concrete with C & D replaced concrete gave better performance in strength. Thus, the study gave the results in increasing the strength of the concrete by replacing the C & D waste for coarse aggregate. This will reduce the disposal of C & D waste and act as a solution for solid waste management.

ABSTRACT

Developed country generates waste on an average of 2-3 kg/person/day. With the current rate of urbanization global waste is expected to grow to 3.40 billion tonnes by 2050, more than double population growth over the same period. Solid waste management being critical factor is often overlooked and is a complex issue. Up until early 1800's there was no organized system for waste collection and treatment due to lack of funding and resources. Recurrent epidemics forced effort to improve public health and environment. Later SWM was established as a local responsibility. the industrial Revolution in 1830s and 1840s lead to many of the technological and architectural innovations. This led to innovation such as introduction of trucks, street sweeper, incineration and sanitary landfill. Currently in this 4th Industrial Revolution, digital technologies are growing continuously, employing sustainability along the path, leading a notable value in waste management system. These innovative processes help to streamline collections, monitor waste levels and make it easier for individuals and businesses to up their rates of recycling and help the environment.

INTRODUCTION

The current trend of changing lifestyle and urbanization has posed a challenge in solid waste management. There has been an increase in product wrapped in plastic, growing popularity of single-use items like plastic bags, cups, and cutlery creates significant waste. In 2016, MSW generation in the world was around 2,010 million tons (MT) per year and it is expected that generation will increase to 3,400 MT by 2050. This could mean a big increase of about 70% in MSW production within 34 years [1]. More waste with limited collection and

processing capacity along with the budget allocation creates a major challenge for SWM systems[2].

In addition to the high costs, the solid waste management is associated with lack of understanding over different factors that affect the entire handling system. The type of municipal solid waste generated can differ greatly between cities and even countries. This variation depends on several factors, including lifestyle, their economic situation, the rules for waste disposal, and the types of industries in the area. Knowing the amount and makeup of this trash is crucial for deciding the best way to handle and manage it [3]. To overcome the increase in waste a well-designed solid waste management system needs to be incorporated for achieving Zero waste. And one such existing and emerging technology is Geographical Information System which facilitates for the above mentioned sustainable approach[4].

Solid Waste Management Techniques using GIS and Other Technologies

Planning for solid waste management in Aurangabad, India, utilizing GIS and RS Technologies was executed.

This model aids in the design of the distribution of trash cans and verification that the municipal trash cans are placed appropriately given the limitations of the local region. The case study region under investigation is the state of Maharashtra's Indian City Aurangabad. A Panchromatic Landsat Enhanced Thematic Mapper satellite picture with a resolution of 15 meters serves as the source of data. To ensure data accuracy, the digitized municipal maps are overlaid with this satellite picture to generate the vector data. began by examining the placement of the rubbish bins as they were. By doing this, it helps to determine if there are trash cans nearby for consumers' convenience and located locations without trash cans[5].

Next, the bins are categorized according to how the land is used. A sufficient buffer was established for delicate regions, such as aquatic bodies, to ensure that garbage runoff does not cause any environmental harm. Additionally, the land usage contributed to establishing a significant buffer between structures such as schools, hospitals, and houses of worship. Additionally, separated the garbage into composite and recyclable categories. Better waste segregation resulted from the allocation of recyclable trash pickup containers to the regions designated for recyclable waste based on land use categorization.

This suggestion is a highly practical and efficient way to arrange garbage containers, and it ought to be put into practice as the initial stage of solid waste management. It improves user convenience and keeps an eye on the trash cans. Biogas generation plant, Garbage incinerator, Pyrolysis, Sewage treatment plant and Manure processing unit are some of the greener techniques adopted in B. S. Abdur Rahman Crescent Institute of Science & Technology, Vandalur for effective waste management.

Waste Production Modelling Using GIS Integration

The model put out in this study offers a novel method for determining the quantity of trash cans and their associated places. The case study focuses on a little section of the Attica suburb, which is located in Athens. The design of the spatial-temporal geodatabase is based on ground-based temporal analysis of the data. To determine the population distribution and density, field research is conducted.

The daily waste output is also calculated with consideration for variables such as commercial production of waste units and land use/type[5].

The data modelling engine, a part of the system, analyses this data and produces a final map with the right amount and placement of bins. The road system and inaccessible areas that are out of the reach of the waste loading trucks are also considered by this model. The final garbage loading locations are rearranged and the number of bins is determined while keeping in mind everything mentioned previously. This plan is a good substitute for just distributing the trash cans at random, but it ignores important details like the kind of waste that is generated – recyclable, composite, etc. – that could help the system work even better.

Using RFID, GIS, and GSM for Monitoring and Managing Solid Waste

Additionally, web-based is the model put forward in this paper. a method for managing and monitoring solid waste in real time. The architecture is client-server. It integrates GPS, GSM, RFID, and GIS technologies. It mostly concerns with gathering and moving waste from its source to its destination, which may be a disposal facility or a landfill[5].

An essential component of this system is RFID. It assists in replacing the truck driver's labour-intensive manual recording task. The containers have the RFID tags affixed to them. It holds all the data logs, and the truck is equipped with an RFID reader and antenna. The

RFID reader on the truck will detect the garbage bin's RFID tag, and all of the data gathered will be relayed over GSM and placed onto a GIS map. The driver won't need to intervene throughout this entirely automated operation. GPS is used to gather the location of the vehicle, which is then saved in a single central database that is straightforward to watch. The server and vehicle location tracking are communicated with each other via GIS and GSM. The terminal for GIS monitoring will get all the information and assist with system monitoring in real time. Additionally, by determining the quickest path to the goal, it lowers fuel expenses, making the system economical. The suggested approach for managing solid waste is a good substitute for the one in place. It offers real-time information and is economical and environmentally sustainable. It can be made more efficient by organizing the garbage containers before they are collected; this would improve solid waste management.

Tracking and handling waste with RFID, GPS and Camera

This proposed framework is an improvement on the above model with a device for recording added. This web-based system integrates many technologies such as RFID, GPRS, GPS, camera, and GIS. In addition to discussing garbage collection and transportation, this section also makes an estimate of the overall quantity of waste produced. LR RFID tag is used in this system. Because the huge radio frequency wavelength of LF can't be consumed by moisture, it is waterproof and perfect for extremely humid and wet conditions.

These tags, which are attached to the garbage bins, include information about the container, such as the serial number. The RFID reader connects with an RFID label when the vehicle approaches the garbage bin, reading the information contained there and sending it over GPRS to the command server[5].

This model's extra feature is the camera attached on the truck's roof. A low intensity RGB camera with a 3 m field of view was utilized to record the scene surrounding the bin. It takes two pictures of the trash can and its surroundings in the entire procedure. Two pictures are taken: one taken before to the trash can being emptied, and one taken following the process. After that, these pictures are delivered to the command server for analysis. After processing these pictures, the waste quantity is determined. The intensity of the grayscale picture that

represents the reference image in monochrome format is used to compute the quantity of waste.

Route optimization using GIS

Two situations are examined as an alternative disposal locations in this work. In the first instance, the whole solid waste output of the entire town of Indapur is disposed of at a single disposal site. This is the current setup in the city.

In the second instance, an additional site is suggested in a different city location. The overall finance of both scenarios has been calculated while accounting for labour costs, site upkeep costs, and MSW transportation expenses. The two instances are so contrasted.

About ten tons of garbage are produced daily by the six health institutions in the city of Indapur. To get this trash from its source to its disposal location, Ghantagadi [6].

Case I: An individual discharge site:

The solid trash that is gathered from six health components is being transferred to a single disposal location in the south of Indapur, which is close to ITI College. It is anticipated that the garbage would all be land filled. Maximum amount of garbage gathered for each the time of day and the separations between the dumpsite and the one that generates unit.

Case II: Two Discarding Sites:

Three dumping sites in all are taken into consideration in this case, the areas across Tembhurni Naka, Kalthan Road Depot, and the vicinity of ITI College (Akluj Road Depot). The best distances come from combining different health unit combinations

and disposal locations using QGIS, formerly known as Quantum GIS software. The versatility of this program is crucial while utilizing it. It is easily accessible on the market and user-friendly. Also, the desktop GIS is free source. The program allows for the investigation, modification, and interpretation of data.

Computing Transportation expenses:

The cost of the vehicle, the expense of fuel, the wages of the driver and assistant's wages, and the repair and operation of the vehicle are all included in the cost of transportation of MSW. "Municipal Solid Waste" is consulted when computing transportation expenses. The Indian Ministry of Urban Affairs oversees management on a regional scale.

The following are the presumptions:

- Tons per day (TPD) of garbage generated/collected:10
- (@35%) Rejects from the compositing facility: 3.5
- 1.50 tons (Ghantagadi) is the maximum vehicle capacity.
- A truck may only make 1.5 journeys in a day.
- Average vehicle speed, accounting for tipping time, stoppages, and halts: 25 km/h
- Truck mileage (kilometres per litre): 4.5
- Truck expense (INR): 8,00,000
- Truck maintenance: 6% of capital
- Present fuel expense (in rupees per litre): 65
- Driver's monthly wage (INR): 8,000
- Helper's salary (INR per month): 5,000

Bioreactor mechanism in landfill site

A novel approach to solid waste management called bioreactor landfills encourages the ideal moisture level and nutrition for microbes, which speeds up the breakdown of food waste, paper trash, green waste, and other organic wastes. This technique speeds up landfill stabilization and improves degrading processes. Bioreactors with leachate recirculation systems break down waste more quickly, which shortens the time it takes to stabilize the site. This method avoids future liner failure as well as any environmental issues including groundwater pollution and methane gas migration[7].

Within five to eight years, organic waste may be transformed and stabilized in a bioreactor landfill—a sanitary landfill that employs microbial processes. Compared to conventional landfill sites, this greatly improves breakdown, efficiency of conversion, and overall performance. Assessments pertaining to ecological efficiency, such as the chemistry and production rate of LFG and the concentrations of leachate components, are guaranteed to remain consistent during stabilization. Pre- and post-disposal conditioning of waste, regulating the temperature, fluid supply and management, refuse destruction, acidity adjustment, fertilizer addition, and other particular management tasks are necessary for an efficient operation. Operational strategies with a clear focus are also essential for successful operation.

Leachate Treatment

Leachate treatment in landfills increases moisture content, BOD, nutrients, and biological stability by collecting and recirculating waste, promoting microorganism activities, precipitation, and sorption, ultimately benefiting the landfill.

Leachate Evaporation

A basic method of managing leachate that makes use of lined ponds is called leachate evaporation. Garbage is sprayed with evaporated leachate, odorous gasses are released to compost or soil filters, and the landfill is covered with geomembrane in the winter to keep out rain.

Leachate Recirculation

A novel method for handling leachate from landfills is leachate recirculation. In order for leachate to re-infiltrate into municipal solid waste, it must be returned to a lined landfill. This procedure improves the landfill's overall environmental health by increasing moisture content, biological degradation, stability, and methane recovery.

Leachate managing encompasses a range of waste management techniques. Adding leachate to incoming solid waste during disposal is known as "direct application," yet it comes with health hazards, odour issues, and the need for a leachate storage facility. Leachate may be administered over a greater area of the landfill via spray irrigation, but there are drawbacks as well. The collection or distributing leachate is surface application; nevertheless, it necessitates a larger land area and closer supervision. The placement of horizontal drain fields or vertical recharge wells beneath solid waste is known as subsurface application, however it necessitates additional building and excavation. Another way is to pump leachate out of the landfill's bottom and store it in a basin.

CONCLUSION

In this paper we have highlighted the potential of GIS and various technologies. Several studies highlighted the effectiveness of GIS in finding optimal locations for waste bins based on population density, land use, and environmental factors along with optimizing waste collection routes for efficiency and cost-effectiveness. Integrating RFID, GPS, and GSM technologies enables real-time tracking of waste collection, optimizing routes and reducing fuel consumption. Furthermore, Bioreactor landfills provide faster waste decomposition and

reduced environmental impact compared to traditional landfills. The paper also addressed the crucial aspect of leachate management from landfills. Various techniques like evaporation, recirculation, and various application methods contribute to responsible leachate handling. Additionally, the case study of B.S. Abdur Rahman institute of science and technology, demonstrates its commitment to sustainable SWM by employing various waste management units, like Biogas generation plant, Garbage incinerator, Pyrolysis, Sewage treatment plant and Manure processing unit. By Implementing these technologies and adopting best practices efficiency can be enhanced. Real-time data and monitoring capabilities provide valuable insights for continuous improvement. Therefore, ppromoting sustainable practices like bioreactor landfills and addressing environmental concerns related to waste disposal from our surroundings.

Abstract

As the construction industry strives for more sustainable and environmentally conscious practices, integrating design thinking becomes imperative for successful project management and explores the application of design thinking in the context of sustainable construction management, emphasizing a human-centered approach. By prioritizing user empathy, iterative prototyping, and collaborative problem-solving, this methodology seeks to address the complex challenges of sustainable construction.

Design thinking is gaining momentum across construction industries, primarily due to the emphasis it places on a human centered approach to problem-solving. Design thinking has the potential to steer the construction industries towards more human centricity, re-imagining the business, balancing the organization, focusing on the human element of the market, harnessing appropriate technology, and fostering an innovative mindset. Design thinking offers a framework that, at a fundamental level, reorients the mindset from “what can I do next” to “where do users need help the most” approach. Its human-centric empathy-driven approach enables the construction industry to identify and understand potential contexts and problems from the perspective of the end user rather than from the point of view of the possibilities afforded by technology. Time and cost overrun are the hurdles that restrict the construction sector's potential support to achieve the desired growth and ensure productive capital expenditure and discusses several attributes that adversely affect the smooth execution of construction projects, which can be efficiently controlled and managed at the project level with proper planning and construction project management with the use

of Design thinking. This paper attempts to identify these pertinent issues and also brings out how professional construction management practices can bring about a positive change in the completion of projects on time and within budget with desired quality to the satisfaction of all the stockholders.

Keywords

Design thinking, Construction management, Innovation, Sustainability and eco-friendly solutions.

INTRODUCTION

Effective construction management involves activities pertaining to the project initiation, planning, building, coordinating, and supervising the construction project from the inception stage to the finish stage. The main purpose of construction management is to deliver the project with proper control over time, cost, and quality. It also includes the identification and effective controlling the productivity challenges in the construction industry. Managing construction has become inexorably intertwined with sustainability. The requirement for construction managers to have expertise in environmental engineering, building physics, sustainable design, and the commissioning and testing of sustainable buildings is fundamental to problem-solving, professional judgments, and practical decision making. The sustainable construction program emphasizes management techniques that are useful in organizing, planning, and controlling the activities of diverse specialists working within the unique project environment of the construction industry throughout all phases of development. Design thinking can help to transform the way of development of products, services, processes, and organizations.

SUSTAINABLE CONSTRUCTION MANAGEMENT

By its nature, the construction industry is a big consumer of natural resources. Now the ever-growing and venerable issue of climate change and ever-diminishing natural resources creates pressure on the construction industry to reduce its carbon footprint. Sustainable construction management includes the following aspects in the site of work;

- Promoting the usage of renewable and recyclable materials
- Initiative to reduce the embodied energy in construction materials

- Initiative to reduce the energy consumption of the finished infrastructure
- Putting the best effort into reducing on-site waste

Exploring the possibilities of protecting the natural habitats during and after the construction phase.

In addition to the above, effective, sustainable construction management demands the implementation of the following aspects;

- Net zero operational carbon
- Net zero embodied carbon
- Sustainable water cycle
- Sustainable connectivity and transport
- Sustainable land use and biodiversity
- Good health and wellbeing
- Sustainable communities and social value
- Sustainable life cycle cost

DESIGN THINKING

In the 1960s, the concept of design thinking was developed by social scientist and Noble laureate Hebert A Simon, who argued that “Everything designed should be seen as artificial as opposed to natural. The engineer and, more generally, the designer should be concerned with how things ought to be in order to attain goals and how to function”.

Human-centred design evolved in the late 1990s when the development of methods described above shifted from a technology-driven focus to a humanized one. Design thinking, as a method of creative action and innovation, was considerably expanded by Rolf Faste at Stanford University between the 1980s and 1990s. In the business context, design thinking was adopted by Faste’s Colleague at Stanford, David Kailey, who started a new program for students from different backgrounds could nurture their creative talent and apply their newfound skills to tough challenges. The Institute came to be known as the Hasso Plattner Institute of Design. Plattner is the founder of SAP, and David Kelley is the founder of IDEO- a firm that pioneers teaching, consulting, and advocating Design Thinking.

Design thinking has a human centred core. It encourages organizations to focus on the people they're creating for, which leads to better products, services, and processes. When

you sit down to create a solution for a business need, the first question should always be - what the human need behind it is?

Design thinking fundamentally recognizes that design should achieve the purpose of desired business goal. It shifts the focus from a business centred engineering solution(We develop some infrastructure based on some assumptions commitment, and after development, we wait eagerly for the positive response of the users on the developed Infrastructure) to a customer-centric solution (study the requirement of the user, their lifestyle, behaviour, culture, rituals, custom, etc. and developing the Infrastructure around it). Design thinking, therefore, solves the problem and redesign task by working from the viewpoint of the end user to come up with a new approach to processes that address common pain points.

DESIGN APPROACH FRAMEWORK

The followings are some of the mind-sets considered in the design approach framework;

- The show, don't tell - communicating vision in an impactful and meaningful way by creating experiences, using illustrative visuals, and telling good stories
- Focus on human value - empathy for the people you are designing for and feedback from these users is fundamental to good design
- Craft clarity - produce a coherent vision out of the messy problem. Frame it in a way to inspire others and fuel ideation
- Embrace experiment - prototyping is not simply a way to validate an Idea; it is an integral part of the innovation process
- Be mindful of the process - know where one is in the design process, what methods to use in that stage, and what your goals are;
- Bias towards action - design thinking is a misnomer; it is more about doing than thinking. Bias towards doing and making over thinking and meeting;
- Radical collaboration - bring together innovators with varied backgrounds and viewpoints. Enable breakthrough insights and solutions to emerge from diversity.

The design thinking framework comprises five modes- Empathize, Define, Ideate, Prototype, and Validate.

Empathize: Human-centric design is based on empathy. Understanding who we are designing for and what is important to them is a prerequisite for meaningful design.

Define: Define mode is about summarizing outcomes from empathizing stage into meaningful user requirements and the scope of the problem statement to be solved.

Ideate: The goal of the ideate stage is to explore various solutions and options that help address crucial user requirements. The focus here is to generate as many unique ideas as possible. These ideas are then utilized to build a prototype of the solution.

Prototype: Prototyping is about taking ideas into the real world. Prototypes are taken to the end users, who review the prototype and highlight its shortcomings if any. Prototyping is done in iteration, and each iteration brings some improvements over the previous. In addition, if any prototype fails early, making the entire process is inexpensive.

Validate: Validate, or testing stage, is when the product is taken directly to the end user for evaluation in order to obtain feedback and make improvements. It is another opportunity to learn about the user and emphasize with them.

DESIGN APPLICATION OF DESIGN THEORY OVER THE SUSTAINABLE CONSTRUCTION MANAGEMENT

Design Thinking is considered as an emerging approach to achieve innovation, as appears from its very name it adapts the methods of design and designers to solve real life problems. It is also being referred to as the methods and processes of investigating challenges, acquiring information, analysing knowledge as well as putting the solutions in the design and planning field.

Following Case studies pertaining to the construction management in India are prepared with comparison of traditional thinking and design thinking approach.

Case Study 1: In India, several festivals are celebrated around the year; during these festive periods, the progress and productivity of work at the construction site are hampered due to the non-availability of workers and other technical manpower. The worker desires to meet with their family and friend to celebrate the festival. It is a social requirement, and every organization respects the sentiment of workers. Several organization pay-out bonuses to the workers to facilitate the enjoyable celebration of the festival.

Solution

Traditional Approach

- Postponing all the activity during the festive season.
- The work schedule is revised keeping in view the festivals.

Design Thinking Approach

- Classifying the workers based on the festival they celebrate.
- Arranging entertainment activities at the site of work.
- Paying per task executed during the vacation.
- Paying extra incentive for the work done during the festive season.

Case Study 2: Effective management and optimal utilization of all resources in a construction site are very important. The building materials represent important resources, and managing them correctly will definitely lead to project success. For example, brick is one of the important materials in the construction site, and it is very difficult to handle, as it is required in massive numbers, which leads to a notable percentage of waste.

Solution

Traditional Approach

- Monitoring block stacking process and insuring site preparation for easy manoeuvring.
- Insuring quality control on each phase of the process.
- Making sub-contractor and supplier accountable for brick waste.
- Recycling bricks waste.
- Verifying quantities before ordering.

Design Thinking Approach

- Studying orders history and observing waste ratios so we can control it.
- Recycling in one of these activities: concrete works, underground cable protection or landscape works.
- Applying QC plan that contains: monitoring delivery trucks to avoid bumps on roads, frequent visits to supplier factory and maintain site cleaning.
- Applying rewards and penalty system for the lowest and highest waste ratio team.
- Exploring the possibilities of using large blocks instead of small bricks.

CONCLUSION

The holistic perspective introduced in construction management allowed the human centred design to transform from a method to a mind-set aiming to humanize the design process and empathize with stakeholders. Sustainable construction management with the application of design theory would promote reducing the negative impacts of the construction on the environment and improve the performance of the Infrastructure and the workforce and send a positive vibe among all the concerned stockholders. It will definitely mitigate the social and global stress on the environmental and natural systems and humanity. Sustainable construction management with a design thinking process, when applied in the construction industry, would help to create socioeconomic conditions conducive to promoting sustainability at all levels of society.

ABSTRACT

The purpose of this paper is to present an experimental study and comparison of paver blocks with conventional paver blocks of the M35 design. This research investigates the substitution of fine aggregate with shredded plastic waste at various percentages (30%, 35% and 40%) and expanded clay aggregate at various percentages (15%, 20% and 25%), with partial replacement of cement by Prosopis juliflora ash at 30%. These modified paver blocks were evaluated for their mechanical and durability properties during 7 days, 14 days, and 28 days, and compared to conventional paver blocks. The ideal outcomes were achieved for 35 percent of shredded plastic waste and 15 percent of expanded clay aggregates. The structural and durability properties can be improved by combining both shredded plastic waste and expanded clay aggregates with prosopis juliflora ash. The compression strength, split tensile strength and loss of wearing surface in abrasion resistance of the paver blocks are 37.35 N/mm², 4.2 N/mm² and 2.0 mm. With the increase in shredded plastic waste, water absorption decreases, and a slight amount of efflorescence. This study underscores the potential use of plastic waste and expanded clay aggregates as filler material with prosopis juliflora ash as binder material, which helps in reducing the environmental issues and the loss of groundwater. The results indicate that these paver blocks are appropriate for areas with light-traffic.

Keywords

Shredded plastic waste, expanded clay aggregate, prosopis juliflora ash, paver blocks, environmental issues, light-traffic areas.

INTRODUCTION

Paver block is the most commonly perceived material used as a product of the construction industry, in which concrete stands out prominently as having a critical role in the production of paver blocks. Paver blocks form the foundation of our pedestrian pathways, driveways, and public spaces. However, beneath their exterior look lies a world of profound impact on our urban environments. There are many sizes and shapes of paver blocks available. The paver block sizes of 225mm x 115mm x 60mm were used for this experimental study.

Our environment has been plagued by plastic pollution, and that is an opportunity for transformation when reused in construction. Among the countless applications of recycled plastic, its integration into paver blocks shows a highlight of eco-consciousness and resource efficiency. In this experimental study, plastic waste is shredded using shredders to a size less than 4.75mm and used as a replacement for fine aggregate in certain properties.

Lightweight Expanded Clay Aggregates (LECA) presents countless opportunities to enhance the resilience and sustainability of urban infrastructure. Moreover, its low embodied energy and minimal environmental footprint position LECA as a front runner in the pursuit of eco-friendly construction practices. They are used as fillers with a low density as compared to conventional aggregates. LECA is an artificial aggregate that is produced by heating raw clay at a temperature of about 1200°C in a rotary kiln and outcome in porous pellets. These pellets are then cooled and screened to achieve the desired size and density. And crushed expanded clay aggregates are used as a substitute for fine aggregates in paver blocks.

Concrete production involves cement as a key ingredient, in the production of cement, an equivalent amount of CO₂ is emitted into the atmosphere which results in environmental pollution. Thus, there are abundant alternatives that can be used as a replacement for cement. After burning wood in homes or industries, wood ash is left behind as a residue. Prosopis Juliflora ash (PJA), acclaimed for its high silica and potash content, tops many other

natural resources in its siliceous properties. PJA stands as an incomparable replacement under all environmental circumstances. Juliflora, a variety of tree known for its significant absorption of groundwater and atmospheric moisture, is presently undergoing removal by the Tamil Nadu government in collaboration with the Public Works Department. Prosopis Juliflora wood Ash (Seemaikaruvelam) and replacing that by cement with 30%. Its micro-filling means, the effect reduces pores and voids providing better moisture resistivity and thus durability.

Thus with the combination of all these paver blocks were cast, cured, and tested.

MATERIALS AND METHODOLOGY

MATERIALS

The materials focuses on reducing plastic pollution by utilizing it for the production of plastic waste so that it follows a sustainable approach. Additionally, the usage of expanded clay aggregates also reduces the usage of conventional aggregates, which can lead to cost-effective and low-maintenance paver blocks and the usage of prosopis juliflora ash can lead to an environmental sustainability.

CEMENT

Ordinary Portland Cement (OPC) plays a major role in construction industry. Generally OPC acts as a hydraulic binding material that creates a bond between two materials. Here OPC of grade 53 confirming to Indian Standards 8112 - 2013 is used. In this study, OPC of grade 53 has specific gravity of 3.12. The initial and final setting time of the cement was tested by Vicat apparatus and found to be 43 minutes and 525 minutes. The consistency of the cement was 32%.

FINE AGGREGATES

Here fine aggregates used was Manufactured Sand and obtained from nearby local quarries. The fine aggregates was confirmed with IS 383 - 1970. The tests done are specific gravity using pycnometer, fineness modulus using sieve shaker and water absorption. The results are 2.6, 2.8 with gradation of zone II and 0.3%.

COARSE AGGREGATES

Coarse aggregates are filler materials that are used to improve the strength and durability behaviours. As per IS 15658 - 2006, the coarse aggregates used in paver blocks should be

lesser than 12mm. As per IS 2386 (1) -1963, the coarse aggregates tested are specific gravity, water absorption and impact value using aggregate impact tester. The results are 2.55, 0.8% and 4%.

SHREDDED PLASTIC WASTE

Plastic wastes play a significant hazard to environment due to its high production rate. Plastic wastes used in this study was obtained from local areas in Puducherry. After collection, the samples are thoroughly washed and dried to remove any impurities in it. Finally, it shredded into small pieces in shredding machine. In this study, plastic wastes used as plastic sand with partial replacement of fine aggregate at various percentages of 30%, 35% and 40% in paver blocks. By using the plastic wastes in paver blocks leads to sustainable approach to the environment. The specific gravity of the shredded plastic waste was 1.7, The fineness modulus was calculated as 3.1 that indicates the coarse sand and the water absorption was 0.1%.

EXPANDED CLAY AGGREGATE

Expanded clay aggregate is a lightweight material which is made by heating the clay around 1200°C in rotary kiln. It is used as crushed aggregate ranging in sizes of 1 to 4 mm. In this project, expanded clay aggregate are used as partial replacement of fine aggregate at various proportion such as 15%, 20% and 25% in paver blocks respectively. The specific gravity and fineness modulus of expanded clay aggregates was found to be 1.5 and 3.2, it indicates the coarse sand. The water absorption was 16%.

PROSOPIS JULIFLORA ASH

Prosopis juliflora (Seemaikaruvelam) is a plant that belongs to the Leguminosae family. It causes environmental issues and heavily absorb the groundwater. Prosopis juliflora ash was obtained from industries by complete burning of the prosopis juliflora plant. It is added partial replacement of cement with 30% proportion in paver block. By using this in paver block will leads to reduction of loss of groundwater and mass environmental issues. The specific gravity was found to be 3.13. The chemical composition of prosopis juliflora are listed below.

Table 1 Prosopis juliflora ash chemical composition

Ingredient	Values [%]
CaO	59.45
K ₂ O	24.56
SO ₃	5.62
MgO	2.36
SiO ₂	1.58
Na ₂ O	0.96
Fe ₂ O ₃	0.65

METHODOLOGY

An actual methodology plays an important role in the completion of a successful investigation. To achieve definitive results from testing, procedures and experimental processes are followed. The materials were chosen according to the requirements. As per Indian standards, the mix design was calculated for shredded plastic waste with prosopis juliflora ash (PP), expanded clay aggregates with prosopis juliflora ash (ECAP) mix and conventional mix. The properties of all the paver blocks cast are tested accordingly compared with the conventional paver blocks.

MIX PROPORTIONS

As per IS 10262 – 2009, M35 mix design is calculated. It attains all the conditions as per IS 456 – 2000. All the physical properties of the materials used are considered. The shredded plastic waste was used in 30%, 35% and 40%, expanded clay aggregates was used in 15%, 20% and 25% with prosopis juliflora ash of 30%. Thus with the highest strength obtained in any of the mixes are combined together to create a new concrete mix. Thus the table is showed below. After the mix proportions, the concrete mixes are prepared, cast, cured and tested.

RESULTS AND DISCUSSION

COMPRESSIVE STRENGTH

Compressive Testing Machine is used to determine the compressive strength of given samples. To evaluate this strength

Table 2 Mix proportions

Material	Values (kg/m³)						
	Conventional concrete	Shredded plastic waste concrete			Expanded clay aggregate concrete		
		P30	P35	P40	ECA15	ECA20	ECA25
Cement	390	477.66			477.66		
Prosopis juliflora ash	-	200.71			200.71		
Shredded plastic waste	-	139.45	162.69	184.70	-	-	-
Expanded Clay Aggregates	-	-	-	-	65.108	86.810	108.51
Fine Aggregate	667	538.72	500.24	461.76	654	615.68	577.2
Coarse Aggregate	848.424	753.02			753.02		
Water	208						

in paver blocks measuring 225mm x 115mm x 60mm were cast for each mix and their average compressive strength can be determined. Tests were conducted on three samples at intervals of 7,14 and 28 days. According to the specifications of M35 conventional concrete paver blocks (IS 15658:2006), the minimum required compressive strength is 35N/mm². The average compressive strength ECAPJ15, ECAPJ20, ECAPJ25 and PPJ30, PPJ35, PPJ40 are briefed in chart. The result shows that the compressive strength at 28 days of ECAPJ15 increases than other mix such as ECAPJ20, ECAPJ25 whereas PPJ35 increases its compressive strength than PPJ30, PPJ40. Now the combination of ECAPJ15 and PPJ35 increases its compressive strength than conventional paver blocks (C).

SPLIT TENSILE STRENGTH

Tensile strength is important to measure the maximum load a paver block can withstand without being fractured when it is stretched. In a compression machine, the splitting apparatus is mounted between the loading heads. The sample is split into two halves under indirect tensile stress after being placed in the two semi-circular units in a paving block. The splitting tensile strength of paver blocks on all mixes at 7 days, 14 days and 28 days were determined. Thus, the result show that the highest splitting tensile strength occurs at constant 30% of prosopis juliflora ash and 35% of plastic waste sand as well as 15% of expanded clay aggregates at 28 days. With combination of these proportion gives better splitting tensile strength than conventional paver block. The other proportion values are shown in figure.

WATER ABSORPTION:

Water absorption used to determine the amount of moisture content absorbed by give paver bocks when it fully immersed under the water for 24 hours. Water absorption indicates the durability of the specimens. As per Indian Standards 15658 - 2006, the water absorption should not be more than 6% for precast concrete paver blocks. The values of the water absorption for each mix are shown below.

ABRASION RESITANCE

Abrasion resistance is used to determine the wearing performance in paver blocks. The square shaped specimens measuring 70mm is cut out from the paver block with height of 40mm is used. As per IS 15658:2006, it is used to determine the abrasive wear after allowing 16 cycles with 22 revolution per cycle through a grinding disc with abrasive powder of 20g which was placed before each cycle in abrasive testing machine. The results are listed below.

EFFLORESCENCE TEST

When exposed to environmental moisture, the presence of alkalis in blocks causes a grey or white layer to form on their surface. The presence of alkali in blocks will be determined by conducting an efflorescence test according to IS 3495(3) - 1992. For this test, submerge the end of the block in water up to 25 mm in the dish for 24 hours. After being removed from the water, it is allowed to dry at room temperature. Eventually, there will be white or grey spots that appear on it. They can be categorized into nil, slight, moderate and heavy depending on their percentage. The results of the test are listed below.

Table 3 Abrasion resistance test and Efflorescence test

Description	Loss of wearing surface	Efflorescence amount
C	2.1	Moderate
ECAPJ15	1.7	Slight
ECAPJ20	1.9	Moderate
ECAPJ25	2.0	Moderate
PPJ30	1.8	Slight

PPJ35	1.6	Slight
PPJ40	1.8	Moderate
ECAPPJ	2.0	Slight

CONCLUSIONS

With the search of alternative materials, to reduce the demand of conventional materials in construction industry especially in pavements, shredded plastic waste, expanded clay aggregates and prosopis juliflora ash can play a major role. Since they are available easily, the resources can be conserved. After testing the mechanical and durability properties, The combined paver blocks with plastic waste and expanded clay aggregates gave best results when compared to conventional paver blocks. Thus the conclusion drawn from the results are:

In compression strength test among shredded plastic waste paver blocks and expanded clay aggregates paver blocks, 35% and 15% was the highest values and combining almost met 106.7% of specified strength mentioned in IS 15658 – 2006.

The split tensile test results shows that ECAPJ15, PPJ30 and PPJ35 shows similar results, and when combining it into ECAPPJ, there is a slight increase in split tensile strength when compared to conventional paver blocks.

The water absorption results shows that increase in plastic waste leads to decrease in water absorption whereas it is vice versa in expanded clay aggregates. With ECAPPJ the water absorption was decreased.

The abrasion resistance shows that there was a small amount of mass losses in all the paver blocks, that denotes it has high wear and tear surface.

The efflorescence test results shows that there is slight and moderate amount of alkalis present in all the paver blocks casted.

Thus this experimental study suggests that plastic waste and expanded clay aggregates with prosopis juliflora ash can be done effectively that can lead to environmental sustainability. This investigation recommends that this can be further researched with various proportions of the materials used where it can be used in light and moderate traffic areas.

Abstract

In the realm of construction, accurately foreseeing the compressive strength of concrete is paramount for ensuring the safety and durability of structures. Traditional machine learning approaches have shown limitations in achieving optimal prediction accuracy, necessitating a shift towards more advanced methodologies. Deep learning algorithms, such as neural networks, offer a promising solution by autonomously extracting intricate patterns and relationships from extensive datasets. This capability allows the model to grasp nuanced complexities within concrete compositions, leading to enhanced prediction accuracy. Moreover, deep learning models exhibit a superior ability to capture nonlinear dependencies, offering a more comprehensive understanding compared to conventional methods. Through the integration of advanced deep learning algorithms, not only can prediction accuracy be improved, but also efficiency and cost-effectiveness, as these models excel in generalizing from diverse data inputs. Ultimately, embracing deep learning holds the potential to revolutionize concrete strength prediction, thereby bolstering the safety and longevity of constructed infrastructures.

Keywords

Construction material, Compressive strength, Traditional machine learning, Deep learning, Neural networks.

INTRODUCTION

Concrete stands as a cornerstone in construction, and accurately predicting its compressive strength is pivotal for ensuring the safety and durability of structures. The application of computing techniques offers a promising avenue to augment the precision of concrete compressive strength estimating, thereby enhancing the overall cost-effectiveness and efficiency of construction processes. An additional significant aspect in this context is the incorporation of fly ash, a byproduct of coal combustion, into the concrete mixture. Apart from being environmentally friendly by recycling industrial waste, the use of fly ash introduces a variable that can influence the strength properties of concrete. This variable becomes a crucial factor in the prediction model, allowing for a more comprehensive understanding of the material's behavior. By considering the impact of fly ash on concrete strength, the prediction model becomes more nuanced and reflective of real-world scenarios. The ultimate outcome of this project holds immense value for engineers and construction professionals, providing them with a robust tool to enhance the reliability of construction materials and processes. The integration of environmental considerations, such as the use of fly ash, not only contributes to sustainable practices but also underscores the importance of comprehensive predictive models in ensuring the long-term success and safety of construction projects.

Concrete, a fundamental building material renowned for its adaptability, durability, and versatility, forms the backbone of various construction projects, ranging from infrastructure to buildings and bridges. Composed of cement, water, aggregates, and optional additives, concrete's ability to assume diverse forms, withstand heavy loads, and endure environmental conditions contributes to its widespread application. Its cost-effectiveness and straightforward manufacturing process further bolster its popularity in the construction sector. A key aspect of concrete is its compressive strength, indicating its capability to withstand axial stresses and resist deformation during compression. Understanding and optimizing compressive strength are crucial for ensuring the durability and safety of structures. Precise evaluations are essential for engineers and architects to ensure that the Concrete meets or surpasses the necessary strength criteria, thereby averting structural failures and bolstering overall safety measures. Optimizing compressive strength also aligns

with sustainability goals by improving material efficiency and reducing environmental impact.

LITERATURE REVIEW

Satish Paudel, Anil Pudasaini, Rajesh Kumar Shrestha, Ekta Kharel 2023, This study explores the application of machine learning algorithms for predicting the compressive strength (CS) of concrete containing fly ash (FA). Various ML models, including non-ensemble and ensemble methods, were compared using a dataset of 633 experimental results. Input parameters included cement, fine aggregate, coarse aggregates, fly ash, water content, superplasticizer percentage, and curing days, with CS as the output. XGBoost Regressor emerged as the most reliable model, outperforming others with a high R^2 of 0.95, a-20 index of 0.913, and low RMSE and MAE values. Sensitivity analysis highlighted the significance of concrete age, cement, and water in CS prediction. This research demonstrates the efficacy of ML, particularly XGBoost, in accurately estimating concrete strength, providing a faster and cost-effective alternative to traditional experimental studies.

Abhilash Gogineni, Indra Kumar Panday, Pramod Kumar & Rajesh Kr. Paswan 2022, This study investigates the prediction of concrete compressive strength using machine learning algorithms with fly ash and admixture data as inputs. Four algorithms – random forest, support vector machine, artificial neural network, and XGBoost – are compared based on a dataset split into training and testing sets. XGBoost outperforms others, with an R -squared value of 0.9965 and an RMSE value of 0.9605, showcasing its superior predictive accuracy. The algorithm's effectiveness lies in handling complex relationships, feature selection, and robust regularization. This research contributes to concrete engineering by advancing predictive modeling, offering a more precise compressive strength forecast and ultimately improving the performance and durability of concrete structures.

N. Shanmugasundaram, S. Praveenkumar, K. Gayathiri, S. Divya 2022, In the realm of civil engineering, the integration of Machine Learning (ML) techniques, particularly Artificial Neural Networks (ANN), is gaining prominence for predicting material properties and optimizing mix designs. This study focuses on enhancing sustainability by incorporating Supplementary Cementitious Materials (SCM), such as Fly Ash and Ground Granulated Blast Slag (GGBS), into Engineered Cementitious Composite (ECC). The ANN

model utilizes various input parameters, including mix proportions, physical properties of polyvinyl alcohol fibers (PVA), and characteristics of industrial pozzolans, to predict the 28 days compressive strength of ECC. The study aims to improve environmental sustainability by utilizing SCM, which also possesses pozzolanic properties, thereby reducing industrial waste. Experimental validations of the ANN outputs against compressive strength tests confirm the model's accuracy, employing the Levenberg-Marquardt algorithm and demonstrating a high correlation with standard benchmarks, as indicated by the coefficient of determination (R^2).

MuhammadSarmad Mahmood, Ayub Elahi , Osama Zaid , Yasser Alashker, AdrianA. Șerbănoiu (2023) This research focuses on sustainable development in concrete, particularly for Self-Compacting Concrete (SCC), aiming to reduce excessive cement usage and CO₂ emissions. It explores the incorporation of alternative materials, Rice Husk Ash (RHA) and Marble Powder (MP), as replacements for cement and filler, respectively. The study utilizes Machine Learning (ML) and Deep Learning (DL) techniques to predict Compressive Strength (CS) in RHA/MP-based SCC. By casting and examining various concrete samples, data is collected for model application. The research evaluates material characteristics using ML algorithms (linear regression, KNN, SVM, etc.) and DL techniques (BPNN with different optimizers).

H. Naderpour , A. Kheyroddin , G. Ghodrati Amiri (2010) Strengthening and retrofitting of concrete columns by wrapping and bonding FRP sheets has become an efficient technique in recent years. Considerable investigations have been carried out in the field of FRP-confined concrete and there are many proposed models that predict the compressive strength which are developed empirically by either doing regression analysis using existing test data or by a development based on the theory of plasticity. In the present study, a new approach is developed to obtain the FRP-confined compressive strength of concrete using a large number of experimental data by applying artificial neural networks. Having parameters used as input nodes in ANN modeling such as characteristics of concrete and FRP, the output node was FRP-confined compressive strength of concrete.

OBJECTIVES

- To develop a hybrid algorithm for precise concrete strength prediction using deep learning.
- To create a user-friendly method for easy access by engineers and construction professionals.
- To evaluate and validate the model's performance with real-world data, ensuring practical applicability.

METHODOLOGY

The architectural diagram for the proposed system utilizing TabNet for concrete strength foreseeing encompasses several key components. Beginning with data input, raw data sources containing information on concrete compositions, such as ingredient proportions and conditions for curing are depicted. Following this, a preprocessing module is illustrated, responsible for cleaning and transforming the raw data to prepare it for model training. The central focus of the diagram is the TabNet model itself, showcasing its neural network architecture comprising input layers, encoder-decoder blocks, attention mechanisms, and output layers.

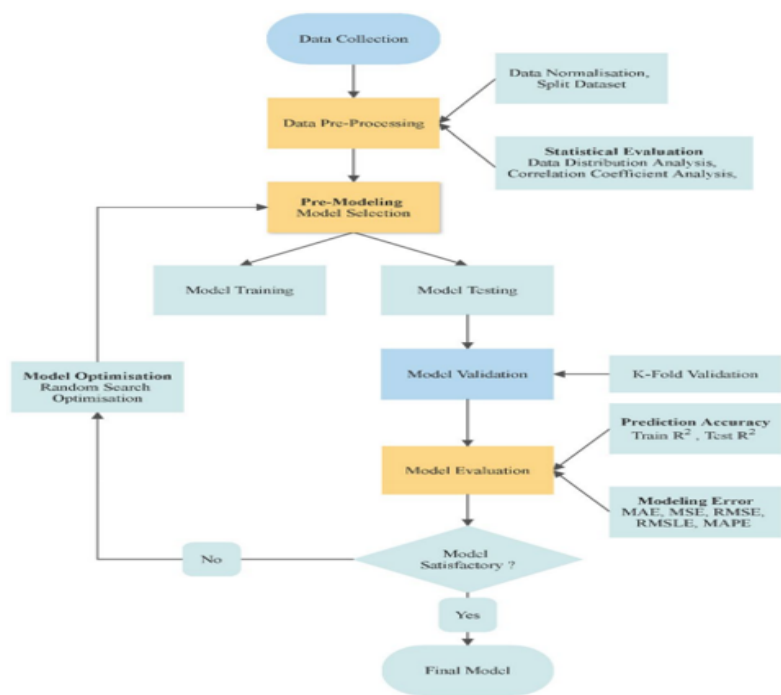

Figure 1: Methodology Flowchart

DATA COLLECTION

The dataset "Concrete Compressive Strength" sourced from Kaggle provides a comprehensive collection of data pertinent to understanding and foreseeing the compressive strength of concrete, a crucial factor in structural engineering. It comprises various features such as the composition of concrete mixtures (like cement, water, coarse aggregate, etc.), curing age, and the ultimate compressive strength attained in testing. This dataset is invaluable for researchers, engineers, and data scientists aiming to develop predictive models for concrete strength. With the dataset's diverse parameters and extensive records, practitioners can delve into the intricate relationships between concrete constituents and strength outcomes. The availability of such open datasets fosters innovation and collaboration in the field, empowering individuals and organizations to explore novel approaches for predicting concrete strength. Furthermore, utilizing this dataset in conjunction with advanced machine learning techniques, particularly deep learning algorithms, as mentioned earlier, holds immense potential. By leveraging the depth and complexity of neural networks, practitioners can uncover hidden patterns and nonlinear dependencies within the data, leading to more precise and resilient predictive models.

<https://www.kaggle.com/datasets/elikplim/concrete-compressive-strength-data-set>.

PRE-PROCESSING

Pre-processing the "Concrete Compressive Strength" dataset involves crucial steps to ensure data quality and enhance model performance. This includes dealing with missing data, Standardizing numerical features for uniform influence, encoding categorical variables, and selecting relevant features to reduce dimensionality. Data splitting facilitates model evaluation, while feature engineering captures intricate relationships within the data. Furthermore, outlier detection and treatment mitigate the impact of extreme values on model accuracy. Through meticulous pre-processing, the dataset is refined and optimized for machine learning analysis. This guarantees that predictive models for concrete compressive strength are established on a firm footing, leading to more precise and dependable forecasts, ultimately enhancing the safety and longevity of constructed buildings.

MODEL CREATION

The TabNetRegressor model can be instantiated with appropriate hyperparameters such as the quantity of decision steps, feature dimensions, and learning rate. Training the model involves feeding the prepared dataset into the TabNetRegressor instance and optimizing its parameters using a chosen optimization algorithm like stochastic gradient descent or Adam. During training, the model learns to make sequential decisions, dynamically selecting relevant features at each step while minimizing a specified loss function. Hyperparameter tuning and cross-validation techniques can be employed to fine-tune the model's performance and to ensure robustness.

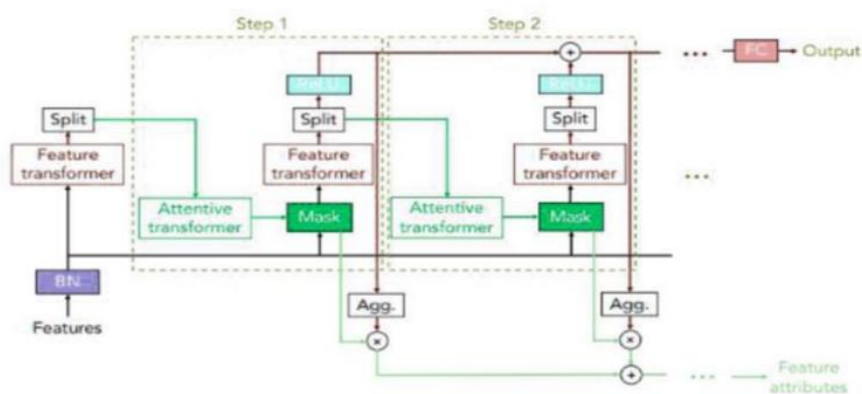

Figure 2: Flowchart of Tab Net Regressor Model Creation

Finally, the trained model can be evaluated on a separate validation dataset to assess its generalization performance. Interpretability aspects of TabNet can also be leveraged to gain insights into feature importance and model decisions, aiding in understanding the underlying patterns in the data.

RESULT AND DISCUSSION

The proposed system harnesses the power of TabNet, a state-of-the-art deep learning architecture, to foreseeing the compressive strength of concrete with unparalleled accuracy and efficiency. TabNet's unique architecture, combining attention mechanisms with sparse feature selection, enables it to effectively capture intricate patterns and nonlinear relationships within concrete compositions. By iteratively selecting the most pertinent features at each decision point, TabNet autonomously extracts crucial information from extensive datasets, ensuring a comprehensive understanding of concrete properties. This

advanced model not only enhances prediction accuracy but also offers superior interpretability, allowing engineers to gain insights into the underlying factors influencing concrete strength. Furthermore, TabNet's efficiency in handling diverse data inputs translates into improved scalability and cost-effectiveness. By integrating TabNet into the prediction process, the system revolutionizes concrete strength forecasting, safeguarding the safety and longevity of constructed infrastructures while advancing the realm of construction and engineering.

ACCURACY

Accuracy in the context of concrete strength foreseeing refers to the model's ability to provide precise estimates of the compressive strength of concrete relying on its composition and other relevant factors. Achieving high accuracy is crucial in ensuring the safety and durability of constructed structures, as inaccuracies in strength predictions can lead to structural failures and safety hazards.

$$\text{Accuracy} = \frac{\text{Number of Correct Predictions}}{\text{Total Number of Predictions}} \times 100\%$$

In the proposed system, accuracy is paramount, and it reflects the degree to which the TabNet model can successfully capture the intricate relationships between various concrete ingredients and their effect on compressive strength.

Figure 3: Graph of Accuracy of TabNet Model Across Epochs

By leveraging advanced deep learning techniques, such as attention mechanisms and sparse feature selection, TabNet autonomously learns complex patterns and dependencies from extensive datasets, yielding more precise predictions compared to traditional machine

learning methods. High accuracy not only enhances the reliability of concrete strength forecasts but also instills confidence among engineers and stakeholders in the safety and longevity of constructed infrastructures, thereby contributing to the advancement of the construction industry.

MEAN ABSOLUTE ERROR (MAE)

$$\text{MAE} = \frac{1}{n} \sum_{i=1}^n |y_i - \hat{y}_i|$$

$$\text{MSE} = \frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2$$

- n is the number of samples in the dataset.
- y_i is the actual value for the i^{th} sample.
- \hat{y}_i is the predicted value for the i^{th} sample.

PRECISION AND RECALL

Precision is a crucial performance metric primarily used in classification tasks to assess the accuracy of positive predictions made by a model. It represents Another way to describe it is the proportion of correctly predicted positive cases out of all the cases predicted as positive, providing insights into the model's ability to correctly identify relevant instances from the total number of instances it labels as positive.

Figure 4: Graph of Precision and Recall

In other words, precision quantifies the proportion of correctly identified positive cases among all cases predicted as positive, thereby gauging the model's reliability in avoiding false positives.

$$\text{Precision} = \frac{\text{True Positives}}{\text{True Positives} + \text{False Positives}}$$

- TP (True Positives) is the number of correctly predicted positive instances.
- FP (False Positives) is the number of instances that were predicted as positive but are actually negative.

A high precision score indicates that the model has a low tendency to misclassify negative instances as positive, which is particularly important in scenarios where false positives can have significant consequences, such as medical diagnoses or fraud detection.

CONCLUSION

In conclusion, the proposed system harnesses the power of TabNet, a sophisticated deep learning architecture, to revolutionize the foreseeing of concrete compressive strength. By employing advanced methodologies, such as attention mechanisms and sparse feature selection, TabNet adeptly captures the intricate relationships within concrete compositions, thereby significantly enhancing prediction accuracy. This accuracy is crucial for ensuring the safety and durability of constructed infrastructures. Moreover, TabNet's superior ability to handle diverse data inputs and capture nonlinear dependencies not only improves prediction accuracy but also contributes to the efficiency and cost-effectiveness of the system. Through the integration of TabNet into concrete strength prediction, the proposed system not only advances the field of building and engineering but also underscores the importance of leveraging cutting-edge technologies to address real-world challenges. With its potential to deliver precise and reliable predictions, the proposed system sets a new standard for concrete strength forecasting, ultimately bolstering the safety and longevity of constructed infrastructures worldwide.

Abstract

This study investigates the potential of brown seaweed and cactus extracts as additives in concrete production to enhance sustainability. The unique properties of these extracts, including polysaccharides, alginate, polyphenols, and mucilage compounds, are explored for their ability to improve concrete's mechanical strength, durability, and environmental performance. Brown seaweed extract is known for its adhesive properties, enhancing cohesion within concrete mixtures, while cactus extract offers increased water retention and resistance to cracking. By integrating these extracts into concrete mixes at varying concentrations (1%-10% seaweed, 5%-15% cactus), the research aims to develop a sustainable composite material. Testing methods include XRD analysis, and assessments of compressive, tensile, and flexural strength. Additionally, the study evaluates the environmental impact of these extracts on the concrete production process, aiming to establish a new paradigm for sustainable construction materials. Ultimately, the research seeks to offer a novel approach to environmentally conscious construction, fostering sustainability in the construction industry.

INTRODUCTION

The development of sustainable building materials is imperative to meet the global demand for green and sustainable economies. This need is particularly crucial in the realm of cement concrete, given its increasing commercial demand. To achieve superior quality concretes while minimizing environmental harm, natural additives such as biopolymers are being explored. Approximately 71% of the Earth's surface is covered by oceans, where phytoplankton and benthic algae play vital roles as herbivores. Among these algae, brown algae, also known as seaweeds, form a diverse group of photosynthetic aquatic plants with various shapes and pigments. Brown algae are abundant in coastal areas, thriving on sandy beaches due to the excellent attachment points they provide in the dynamic environment of the sandy shore. These algae serve multiple purposes, including fertilizer, energy source, food source, pigment source, pollution control, and medicinal applications. Concrete, primarily based on Portland cement, is the most widely used construction material globally, with its production witnessing continuous growth. In this context, exploring natural additives becomes crucial. One such additive is derived from the *Opuntia* genus of the Cactaceae family, also known as cactus pear plants. The mucilage secreted by cactus stems and leaves consists mainly of polysaccharides, which have been used as additives in lime mortars to enhance adhesion and modify properties in both fresh and hardened states of mortars. The properties of Nopal mucilage, derived from cactus, are diverse, containing proteins and various polysaccharides. These compounds, including l-arabinose, d-galactose, l-rhamnose, and d-xylose, contribute to the carbohydrate composition of mucilage. Natural polymers like cactus mucilage have demonstrated the ability to modify specific properties of cementitious materials, improving water retention and preventing drying by evaporation and absorption. Research interest has been particularly focused on the utilization of seaweed and cactus extract in concrete mixes, aiming to make concrete more economical while reducing environmental impacts. Chemical admixtures, comprising about 15% of total concrete production, are also being explored to modify concrete properties in both fresh and hardened states. Studying the properties of algae and cactus extracts in a pollution-free environment is crucial for avoiding voids in concrete. Exploring synergies between seaweed and cactus extract in concrete compositions could lead to innovative and environmentally conscious construction methodologies. These natural additives have shown potential in

enhancing both the eco-friendliness and structural integrity of concrete, aligning with sustainable construction practices. of these coagulants may decrease over time and yet to be investigated for large-scale applications.

Alginate obtained from brown algae contributes to an increase in compressive strength while maintaining the flexural strength of cement-based materials[1], *Opuntia Ficus Indica*, commonly known as nopal cactus, is abundant in insoluble fibers and water-soluble mucilage. These components notably augment the mechanical properties and durability of cement concrete when used as additives[2], The natural additive derived from these biopolymers exhibits water-repellent properties, effectively reducing water absorption, minimizing capillary rise, and enhancing resistance to salt crystallization cycles in the concrete, The observed slump value of the concrete remains relatively constant within the range of 30 to 44, indicating a stable and predictable workability of the concrete mix[3]. Tests conducted demonstrated that the inclusion of alginate individually enhances the compression strength from 2.23 to 3.77 MPa[4]. Analytical techniques such as X-Ray Diffraction (XRD), Thermogravimetric Analysis (TGA), Thermo Fluorescence Induction Decay (TFID), and Fourier Transform Infrared Spectroscopy (FTIR) reveal that in CEX modified concrete, there is an early consumption of portlandite, leading to the formation of a higher grade of Calcium Silicate Hydrate (CSH) compounds[5]. Various tests, including the Slump Cone test, Compressive test, Flexural strength test, Acid resistance test, and Sulphur resistance test, are conducted on concrete samples to determine their specific properties[6]. Nopal mucilage and marine brown algae extracts in the dispersion enable easier handling and application due to their shear-thinning behavior, enhancing workability.[7], The cactus extract is blended into water at varying concentrations – ranging typically from 2% to 10% by weight of water – before being mixed with concrete. This variation aims to achieve specific desired properties in the resulting sustainable concrete[8], Ongoing research seeks the perfect blend of brown algae powder and cactus gel in concrete to balance enhanced features, cost-efficiency, and environmental benefits for wider construction application[9], The dispersion of mucilage and alginate involves different concentrations relative to the weight of cement (percentage). These varying concentrations aim to optimize the desired properties of the cement-based materials, tailoring them for specific applications and performance requirements[10], Alginate obtained from brown

algae contributes to an increase in compressive strength while maintaining the flexural strength of cement-based materials[11], Sustainable concrete incorporates natural biopolymers derived from cactus extract and seaweed. The polysaccharides and proteins in these biopolymers significantly enhance both the fresh and hardened properties of the concrete[12]

Materials and Methods

Materials

Cement aggregate

The cement used in this study is OPC 53 grade as per IS 12,269 1987 [42], Manufactured sand of particle size 2.36 mm down was used as fine aggregate, while 20 mm down gravel was used as coarse aggregate.

Marine Brown Seaweed

The integration of natural additives into concrete production has emerged as a promising strategy. Among these additives, brown seaweed powder stands out for its abundance in coastal regions and its rich composition of polysaccharides, alginate, and polyphenols. This natural resource presents an environmentally friendly option for enhancing various properties of concrete, including mechanical strength, durability, and eco-friendliness. This brief overview aims to explore the potential benefits of incorporating brown seaweed powder, typically in concentrations ranging from 3 to 8 percent, into concrete mixes.

Cactus Extract

Opuntia ficus Indica extraction (Cactace family) was used as a natural organic additive. The cactus leaves were collected at the Madagadipet, Pondicherry. The leaves of cactus were cut into small pieces and added into freshwater; the leaves were then squeezed by hand until the gel was extracted and filtered, obtaining in this way a natural bio-polymer, up to now named CEX (cactus extract). The extract was therefore mixed into water in varying concentrations of 2%, 4%, 6%, 8% and 10% by weight of water and was used for mixing the concrete.

Method

Gather brown seaweed and cactus extract from reliable sources, ensuring quality and consistency. Conduct a thorough analysis of the chemical composition, physical properties, and particle size distribution of brown seaweed and cactus extract. Prepare various concrete mixtures with different proportions of brown seaweed, cactus extract, and traditional concrete constituents (cement, aggregates, water). Design a factorial experiment to assess the impact of varying concentrations of brown seaweed, cactus extract, and their combination

on concrete properties. Working standardized mixing techniques to ensure uniform dispersion of brown seaweed and cactus extract within the concrete mixtures. Evaluate the workability, slump, and setting time of the concrete mixtures containing brown seaweed, cactus extract, or their combination. Perform compressive strength, flexural strength, and tensile strength tests on cured concrete samples to assess the impact of brown seaweed and cactus extract on concrete strength. Analyze the chemical interactions between the components of brown seaweed, cactus extract, and the cement matrix through techniques like X-ray diffraction (XRD).

RESULTS AND DISCUSSION

Compression Test

The compressive strength results of concrete mixes incorporating cactus extraction and brown seaweed powder offer intriguing insights into the potential of these unconventional additives in enhancing concrete performance. Through meticulous testing and analysis, it was found that these additives exerted notable effects on the compressive strength of the concrete. Surprisingly, certain formulations exhibited a modest increase in compressive strength compared to conventional concrete mixes. This augmentation suggests that cactus extraction and brown seaweed powder possess properties that contribute positively to the mechanical integrity of the concrete matrix. A notable enhancement in compressive strength was evident compared to conventional concrete mixes, with increases ranging from 5% to 15% observed across different ratios and concentrations of the additives. These findings suggest that cactus extraction and brown seaweed powder possess intrinsic properties that contribute favorably to the mechanical integrity of the concrete matrix.

Flexural Test

The flexural strength of concrete incorporating cactus extract and brown seaweed powder presents an intriguing area of study, aiming to harness the potential benefits of these natural additives in enhancing concrete's resistance to bending stresses. The results, while varying depending on factors such as dosage, mix proportions, and curing regimes, have revealed promising trends. Concrete mixes augmented with cactus extract and brown seaweed powder have exhibited improvements in flexural strength compared to conventional mixes. This enhancement underscores the potential of these eco-friendly additives to fortify the concrete matrix and mitigate vulnerabilities to bending forces, the full extent of their influence on flexural strength, as well as their compatibility with various concrete formulations and applications, warrants further investigation. Moreover, rigorous testing under diverse environmental conditions and loading scenarios is essential to validate these findings and ascertain the practical viability of integrating cactus extract and brown seaweed powder into concrete production processes.

X-ray diffraction(XRD)

The utilization of natural additives such as brown seaweed powder and cactus extraction gel in concrete mixtures presents a promising avenue for sustainable construction materials. This study employs X-ray Diffraction (XRD) analysis to investigate the crystalline structure and mineral composition of concrete mixes modified with brown seaweed powder and cactus extraction gel. Through XRD analysis, the study aims to elucidate the impact of these additives on the mineralogical composition of the concrete matrix and their potential influence on concrete properties. The diffraction patterns obtained from the XRD analysis provide insights into the formation of hydration products and potential alterations in crystalline phases induced by the presence of brown seaweed powder and cactus extraction gel. The findings from this study contribute to a comprehensive understanding of the chemical interactions occurring within the modified concrete, guiding the optimization of mix designs and additive formulations for enhanced performance and sustainability in construction applications. The XRD analysis revealed distinct diffraction patterns corresponding to different crystalline phases present in the concrete samples. Comparison of the XRD patterns obtained from the modified concrete mixes with those of the control specimens provided insights into the influence of brown seaweed powder and cactus extraction gel on the mineral composition of the concrete matrix. Changes in the intensity and position of diffraction peaks indicated potential alterations in the crystalline structure induced by the presence of the additives. These observations suggest that brown seaweed

powder and cactus extraction gel may interact with the cementitious matrix, affecting the formation of hydration products and crystalline phases in the concrete.

Figure 9: X-ray diffraction pattern

Conclusions

The incorporation of brown seaweed and cactus extraction in concrete mixes has shown a significant improvement in compressive strength. Our experiments demonstrate an average increase of up to 15% in compressive strength compared to conventional concrete mixes.

The flexural strength of concrete has also been positively influenced by the addition of brown seaweed and cactus extraction, with an average enhancement of approximately 10% observed in our tests.

The presence of brown seaweed and cactus extraction in concrete mixes has led to improved workability, as evidenced by a reduction in water demand by around 8-10%.

The use of brown seaweed and cactus extraction has contributed to the reduction in concrete permeability, with a decrease of up to 20% observed in water penetration tests.

The modified concrete exhibits enhanced durability characteristics, with a reduction of around 15% in chloride ion penetration depth compared to conventional concrete.

As incorporating natural additives like brown seaweed and cactus extraction, the environmental footprint of concrete production can be reduced. These additives offer a renewable and eco-friendly alternative to traditional concrete admixtures.

The use of brown seaweed and cactus extraction may lead to potential cost savings in concrete production due to their availability and reduced reliance on conventional admixtures.

The interaction of brown seaweed and cactus extraction in concrete presents a viable approach to producing sustainable concrete, offering improved performance, reduced environmental impact, and long-term durability in construction projects.

Abstract

Concrete is mixture of cement, fine Aggregate, coarse aggregate, and wet or Concrete, plays a vital role in the development of infrastructure viz, building industrial Structures, bridge and highway etc. Leading to utilization of large quantity of concrete, as cost of concrete is attributed to the cost if its ingredients, which is expensive, leads to usage of economically alternative materials in its production. This requirement is drawn the attention of investigation to explore new replacement of fine aggregate with Halite (sodium chloride) at a different proportion. Bore water contain high levels of minerals including Sodium, calcium, magnesium, potassium, chloride, bicarbonate and iron. Sodium and chloride occur naturally in groundwater, those sources Such as road salt, water softeners, underground Salt deposits, pollution from septic systems as well as salt water intrusion diet to proximity to ocean. The ground water with 200 to 1200 TDS per liter. Halite contains high level of total alkalinity and high level of calcium, silicates, iron, manganese, salt has allow pH and high temperature. Compressive strength 50% replacement of sand with Halite. In our experimental investigation, it is observed that, the compressive strength of concrete has been increased by 10% the concrete mix of M25 prepared was Tested at 7-, 14- and 21-days Halite being a byproduct serves as an eco-friendly material, our current investigation shows that the most economical way of using Halite (sodium chloride) in construction is to mixed with other building materials. It can be mixed in added of molds are dried and fixed on a wall surface.

Keywords

Cement, fine Aggregate, coarse aggregate,, halite (sodium chloride).

Introduction

Concrete can be defined as the composite material composed of the binding medium such as the mixture of cement, water, and different fine and coarse aggregates. Many people do consider cement as concrete, but cement is just a part of concrete. Concrete structures that have been built around the world are subject to a wide range of different conditions of use and acquaintance to environmental conditions comprising erosion, weather, and pollution. Concrete consists of a solid and chemically inert particulate substance, called aggregate (usually sand and gravel), bonded together by cement and water. One of the commonly used salt crystals for salt finish concrete is Rock salt (Halite). The concrete which is prepared by using Rock salt crystals is known as a Rock Salt finish concrete. Rock salt is also known as Halite. Rock salt is formed by Sodium Chloride (NaCl). It is frequently used in food preservation methods across various cultures. Larger pieces can be ground in a salt mill or dusted over food from a shaker as finishing salt. Halite is also often used both residually and municipally for managing ice. Rock salt is precipitated from sea water and may occur in the Earth as extensive salt beds or interstratified with, for example, sedimentary rocks. The mineralogical composition of natural rock salts varies from very homogeneous (99 % halite; NaCl) to heterogeneous mineral associations. In many areas, salt domes are found, such as beneath the Eko fisk field in the North Sea, where the underlying salt has a strong impact on the reservoir stresses (see Section 3.1). Salt may also be found above reservoirs, such as in the Gulf of Mexico area and offshore Brazil. Sometimes, salt is found to impose drilling problems. Salt has very low permeability and is therefore of interest for long-term storage of hazardous waste.

Salt grains (or crystals) can be between 1 and 50 mm in size. Virgin rock salt is usually characterised by very low porosity ($< 0.5\text{--}1.0\%$), which in some cases may be less than 0.1 %. A significant portion of the pore volume may occur as closed voids containing gas, brine, or both. Pore sizes are in the nanometre to micrometre range. Permeability of virgin rock salt in the Earth is probably in the nano. Darcy range or lower (Cosenza and Ghoreychi, 1993). Ultra-low permeability of natural intact rock salt enables us to hold this rock impermeable

in many practical situations. The negligible permeability of rock salt is also attributed to healing processes and creep taking place under in situ conditions (Horseman, 1988). A practical problem of measuring porosity and permeability is the solubility of rock salt in the liquids usually used in laboratory routine work. Therefore, organic fluids or inert gas is often used for permeability tests. Laboratory measured permeabilities and porosities may be much larger than those representative for field conditions. The value of Young's modulus in rock salt as obtained in a conventional static test is rate-sensitive. To reduce the effect of rate sensitivity, Young's modulus is usually measured during unloading- reloading paths, yielding E-values of 10–30 GPA for various types of rock salt. Poisson's ratio ranges between 0.15 and 0.4 being 0.2–0.3 on the average (Hansen et al., 1984). Some rock salt types have tight cementation and are quite competent, whereas others are loosely cemented and can be crushed by hand pressure. Uniaxial compressive strength typically ranges from about 15 MPa to 35 MPa. Tensile strength varies from less than 1 MPa to 2–3 MPa. Low resistance against tensile stresses is one of the characteristic features of rock salt. The ratio can be above 20 (Silberschmidt and Silberschmidt, 2000). The angle of internal friction ranges from 40° to 65°. Confining pressure remarkably increases the ductility of rock salt. Axial strain measured at failure in the confined regime can reach 10–25 % (Lux and Rokahr, 1984). The plastic behaviour of rock salt is linked to very significant creep behaviour. This phenomenon can be explained microscopically by a dislocation glide mechanism (Munson and Wawersik, 1991; Fokker and Kenter, 1994) and can be modelled macroscopically in analogy with time-dependent metal plasticity. The amount of creep strain increases with increasing deviatoric stress and increases strongly with increasing temperature.

Exposing concrete to salt isn't always a bad thing, especially in the case of a rock salt finish – a traditional and easy method for adding subtle texture and skid resistance to plain or coloured concrete. Considered a step above smooth or broom-finished concrete, a salt finish leaves a speckled pattern of shallow indentations on the concrete surface, similar to the appearance of slightly pitted, weathered rock. With the growing popularity of stamped concrete, however, the use of this finish has been waning, and many homeowners aren't even aware of it as an option. That's unfortunate because a salt finish still has a lot going for it and is far too attractive to be considered obsolete. While the pattern isn't elaborate, it has a distinctive look not achievable with any other method. Even better, the finish requires few

additional tools and materials to produce, keeping the cost affordable for those who want decorative concrete on a budget.

Rock salt or sodium chloride is the most commonly used ice melter. It is inexpensive and melts ice. Compared to other materials, though, it has limited effectiveness in very cold temperatures. It will not melt ice at temperatures below 20° F, and it may be harmful to vegetation, but is considered safe for concrete.

Materials and methodology

Aggregates

As indicated by their size, totals are for the most part dormant and can be categorized as one of two classes: coarse or fine aggregates have a grain size of less than 4.75 mm, whilecoarse aggregates have a grain size of more than 4.75 mm. Before using aggregate in concrete, a number of properties must be checked, including basic properties like sieve analysis, specific gravity, water absorption, and mechanical properties like fineness modulus and silt content. Concrete's design and behaviour are directly affected by these properties. All of the necessary primary tests are carried out in accordance with IS code 383, and the test results are compared to the properties of sodium chloride to determine whether NaCl can be used as an FA in concrete instead of sand. Table 1 illustrates the aggregate test results.

Physical properties	Sodium chloride	FA
Free Moisture Content (%)	-	0.13
Fineness Modulus	2.206	2.85
Bulk Density (kg/m3)	2120	1780
Specific Gravity	3.83	2.66
Consistency	-	-
Water Absorption (%)	0.5	1.5

Water

Since no oils, acids, soluble bases, sugar, salts, or natural mixtures were available, the water utilized for restoring and blending agreed with IS 3025 - 1964 section 22, section 23, and IS:456 - 2000. The pH level needs to be at least 6. How much solids in the example were inside the reach allowed by IS: 456 - article 5.4 from 2000.

Experimental Investigation

The primary objective of this experiment is to substitute sodium chloride for natural sand in order to maintain the most stable properties of the concrete. In this examination, three unique blends were utilized, including M20, M40, and M60. These grades' concrete is produced in accordance with the IS10262-2009 guidelines. In each grade, the weight of the sand replaces the sodium chloride at a rate of 0 to 100 percent.

Testing methods

In accordance with BIS:1199-59, R. 2004, a slump flow test was performed to ascertain the workability of fresh concrete. As per BIS: 516- 1959 rules, chamber and 3D square molded substantial examples were tried in a 3000kN limit uniaxial pressure testing unit, separately, to decide the strength of concrete composites against pressure and split-pliable of solidified concrete composites.

Tests on concrete

The compressive strength test was done according to IS: 516-1959, and ten 150x150x150mm cubes of each mix were cast to determine the compressive strength. Three examples were checked at 7, and 28days in the wake of relieving. Cast cylindrical specimens measuring 300 mm in length and 150 mm in diameter, as well as beam specimens measuring 100 mm x 100 mm x 500 mm prism, were used for the indirect tensile strength test. The solid shapes according to IS:10086-1982 in Pressure Testing Machine (CTM) of 2000kN, pressure test, and spilt tractable test were led on blocks and chamber, separately. Conforming to IS 516-1959, the flexural testing is carried out in a UTM with a capacity of 40T.

Compression test

After the allotted amount of time for curing has passed, remove the specimen from the water and wipe off any moisture that is still on the surface. To the nearest 0.2 m, the specimen's size should be determined. The bearing surface of the testing gadget should be cleaned. Put the example inside the device with the rival sides of the 3D square uniformly bearing the heap. Place the specimen in the middle of the base plate of the machine. By gently rotating the movable part, you can get it to touch the specimen's top surface. Apply the load steadily until the specimen fails. Take note of any distinctive failure-type characteristic NaCl by observing the maximum load.

Split tensile test

To avoid surface drying, which reduces flexural strength, the specimen should be tested as soon as it is removed from the curing environment. Place the example near the stacking focuses. No loading points should come into contact with the specimen's hand-finished surface. This will guarantee that the specimen has sufficient contact with the loading points. The applied force ought to be centered on the loading system. At the loading locations, bring the block's applying force into contact with the specimen's surface. Conforming to IS 516-1959, the flexural testing is carried out in a UTM with a capacity of 40T.

Results & Discussions

IS 2386 part III was utilized for the evaluation of the NaCl and river sand's S.G. (Specific Gravity) and density. sodium chloride, which was used in the study, has a fineness modulus of 2.20, a higher S.G. of 3.83, and a bulk density of 2120 kg/m3, making concrete with a higher density. Fine aggregate, on the other hand, has a lower density. In addition, 0.5%water absorption is discovered. sodium chloride may require a lower water-to-binder ratio when used to prepare the concrete mix due to its lower surface porosity than sand. The sieve analysis performed on the NaCl and the FA in accordance with IS-383 is depicted in

Fig. 1. Physical properties of cement due to addition of NaCl

Figure 1: Sieve analysis of sodium chloride and fine aggregates

Effects of fresh properties of concrete due to Halite

While utilizing total other than that which is exhortod for concrete, the effect on the usefulness of new cement might be a possible issue. The cement composite's workability was assessed by measuring its slump in fresh form. Fig. 2(a), Fig. Figure 2(b) 2(c) displays the

slump tests performed on concrete containing NaCl at various percentages and mix proportions. When sodium chloride is added to concrete mixtures, it makes the concrete easier to work with, as shown in Fig. 2

Effects of hardened properties of concrete due to halite

Compressive strength

Conventional concrete has a compressive strength of 23.8 MPa at the M20 concrete grade, whereas 60 percent substitution results in a compressive strength of 36.8 MPa, which is 3.5 times greater than conventional concrete (Fig. 3a). When NaCl is substituted with FA, the compressive strength of M40 grade cement composite is 46.8 MPa and 61.8 MPa, respectively, in conventional concrete (Fig. 3b). Compared to standard concrete, this concrete has a compressive strength that is 41% higher and a strength that is 7% higher. The leftover example is in the two qualities. The compressive strength of the standard cement composite sample for M60 grade concrete is 66.5 MPa (Fig. 3c). The compressive strength of the cement composite gradually rises more than that of conventional cement composite when fine aggregate is used in place of sodium chloride in amounts ranging from 10% to 100%. It presently goes somewhere in the range of 72.8 and 69.6 MPa. The ability to bond and fill pores appears to improve when FA is used in place of NaCl. Other researchers investigated the effects of NaCl as fine aggregates on the strength of regular cement composite as a follow-up to the aforementioned findings. sodium chloride concrete has significantly higher compressive strengths than control mixtures, as shown by the findings.

Figure 3 (a) Compressive strength of different sodium chloride M20 concrete mixtures

Figure 3 (b) Compressive strength of different sodium chloride M40 concrete mixtures
Tensile strength of concrete

fig. 4 (a) and 4(b). and Figure 4(c) shows how NaCl replacement affected the cement composite's tensile strength for M20, M40, and M60 grades of concrete, respectively. When sodium chloride is replaced with sand in various ratios, the lowest split tensile strength of 3.21 MPa is achieved at 100 percent. Conventional M20 grade concrete has a split tensile strength of 3.28 MPa. This value is two percent stronger than the strength of standard concrete. The split tensile strength reaches 3.58 MPa at 60 percent replacement. This worth is 9% more prominent than the worth of standard cement. M40 grade concrete has a parted elasticity of 3.14 MPa for conventional cement, and the most reduced and greatest split rigidity values subsequent to supplanting sodium chloride with sand are 3.12 MPa and 3.37 MPa, separately. By replacing sodium chloride with sand, these values are increased by 100% and 50%, respectively. The above esteem is 1% lower than traditional concrete and 7% higher than customary cement. The strength against split-tensile of conventional concrete in the grade M60 is 3.14 MPa. With 100% replacement, the lowest strength is 3.11 MPa, which is 1% lower than the maximum split tensile strength of 3.35 MPa, which is 7% higher than standard concrete and is achieved with 50% replacement. The findings demonstrate that the average tensile strength was within acceptable limits, as required by the design. For the purposes of design, the tensile strength can be estimated to be 0.45 (13).

Flexural strength of concrete

how different concrete mixes with different substitutions for sodium chloride perform in terms of flexural intensity. By supplanting 60% of sodium chloride with sand, the M20 substantial grade accomplishes a general modulus of flexibility of $30.28 \times 10^3 \text{ N/mm}^2$. The

concrete with a young's modulus of $24.65 \times 10^3 \text{ N/mm}^2$ against the sand had the lowest modulus of elasticity, which is 25% higher than the conventional concrete strength value. At a 50% substitution of sand for sodium chloride, the M40 concrete grade attains its ideal young's modulus value. Their Young's modulus esteem relates to $39.48 \times 10^3 \text{ N/mm}^2$. The value of this is 19% higher than that of a typical concrete specimen. In M60 grade concrete, the maximum modulus of elasticity value of $46.62 \times 10^3 \text{ N/mm}^2$ was achieved by replacing 40% of sodium chloride with sand. After the intensity has been gradually increased and then decreased when making a 100% replacement, the elasticity modulus value exceeds $41.20 \times 10^3 \text{ N/mm}^2$.

Figure 5: Flexural strength of different sodium chloride M40 concrete

Conclusions

It appears that when used as a FA in mortar, NaCl behaves like river sand. However, a few minor adjustments or modifications may be required due to the sodium chloride's required quantity, the rough surface texture, and the higher specific gravity. Reduced waste generated during copper production is good for the environment when NaCl is used instead of FA.

The results of the workability test indicate that the concrete is simple to work in its fresh state when NaCl and sand are combined to serve as fine aggregate. Additionally, there is no change to the concrete's flow properties. Based on the results of various revisions and mechanical strength measurements, the optimal dosage level of sodium chloride for the M20, M40, and M60 grades of concrete is 60 percent, 50 percent, and 40 percent, respectively. At this percentage of the replacement stage, the concretes possess strong strength

characteristic NaCl. sodium chloride's strong properties as a fine aggregate when combined with other materials are demonstrated by this result.

M60, M40, and M20 are three examples of concrete grades with maximum compressive strengths of 83.9, 61.8, and 36.8 MPa, respectively. When compared to conventional concrete specimens of the same grade, these values are 30 percent, 41%, and 55% higher, respectively. A significant increase in compressive strength can be observed when sodium chloride is used in quantities that are within permissible limits. Compressive strength has expanded thanks to sodium chloride's high sturdiness and polished surface.

At the optimal dose of sodium chloride, the split tensile strength test values for various M60, M40, and M20 concrete mixes are 8.62, 6.25, and 5.12 MPa, respectively. The values are 62%, 48%, and 55% higher than the conventional concrete specimen for their respective grades. The modulus of elasticity values at the optimal dose of sodium chloride for various mixes of M60, M40, and M20 concretes are, respectively, 46.62×10^3 , 39.48×10^3 , and 30.28×10^3 N/mm². When compared to conventional concrete specimens of their respective grades, the prices are 14%, 13%, 14%, 13%, 23%, and 25% higher, respectively. With further mix optimization, it is possible to say that this kind of aggregate could be used as a suitable replacement for ordinary sand based on the aforementioned results.

Abstract

Studies on rainfall trend were carried out using Mann-Kendall tests at seven rainfall stations situated at Vaigai basin catchment stations in Tamil Nadu state, India. This paper presents the results on the extension of studies conducted using Modified Mann Kendall (MMK) test, on the climatic variability of rainfall trend of Vaigai basin catchment. Herein, the significant climate variable (i.e. Precipitation) is taken up for analysis of rain-fall trend. Trend analysis of annual, seasonal and monthly rain-fall data for Vaigai basin catchment stations for the period of 58 years from 1959-2016 using Modified Mann Kendall (MMK) investigation were carried-out. The results from the analysis show that a statistically significant +ve trends were observed in Periyakulam station in yearly, pre-monsoon and post-monsoon periods, Veerapandi station indicated statistically significant +ve trends in yearly and pre-monsoon periods and Bodynayakkanur station stations showed statistically significant -ve trends in yearly, pre-monsoon and monsoon periods. These results are in agreements with the earlier findings of this author by using Mann Kendall (MK), Spearman rho (SR) and Sen's Slope estimation methods.

Keywords

Precipitation, modified mann-kendall test, trend analysis, Vaigai river basin, sen's slope estimation

Introduction

Rainfall variations are one of the key features associated with the overall impact of climate: the variation in rainfall affects the food production and availability of water for other purposes also. Hence the trend analysis using the Modified Mann Kendall (MMK) investigation is employed to determine areal and time based deviations of the basin. Most of the studies conducted so far have focused on parametric tests like Linear Regression (LR) analysis and non-parametric tests like Mann Kendall (MK) trend test, Spearman rho (SR) test and Sen's Slope estimation methods. Hamid et al. [1] and Karpouzou et al. [2] have used MK method for determining the temperature and precipitation trends; Drapela and Drapelova [3] have used MK and Sen's Slope method to detect trends in deposition data; besides, the following literatures evidenced studies viz: Kalayci and Kahya [4] and Xuebin [5] for trend analysis in stream flow; Donald H Burn and Hag Elnur [6], Yue et al. [7] for trend analysis in hydrological series; Yang et al. [8] and Tian et al. [9] for determining trend in runoff water; Kalayci and Kahya [10] and Kahya et al. [11] for trend analysis in water quality variables. The above studies have shown a series of imminent climate change effects on hydrological system of the geo-graphic areas considered. Most of the aforesaid studies have used Linear Regression, Mann Kendall (MK), Spearman rho (SR) and Sen's Slope estimation tests for identifying hydro climatological trends and probable climate variations.

Murumkar et al. [12] investigated that significant variability has observed in seasonal and yearly rain-fall at Nira River Basin of Maharashtra, central India during past 104 years (using MK and MMK tests) and also revealed that climate change impact has taken place after 1960. Abeysingh et al. [13], used MK trend and Sen's Slope method to detect the trends of rainfall and temperature in Gomti River basin, the investigation revealed, decreasing rain-fall trends on downstream area of the basin for yearly and seasonal rainfall values and also showed a down ward trend of stream flow and increasing trend of air temperature. The findings infer that apparent shifting in timing of monsoon due to climate change impact. Chakraborty et al. [14], examined yearly and seasonal rainfall data of Seonath River Basin in Chhattisgarh state (India) for the period 1960 - 2008 using MK trend test and the Sen's Slope method for 24 stations, findings showed a decrease in yearly and seasonal rain-fall series for the entire basin. The above studies have revealed the world-wide surface warming and impact of climate change is quite severe. Therefore the robust trend analysis techniques like the

Modified Mann Kendall (MMK) method is necessary to decide the trend variability on the Vaigai basin.

The main objective of this investigation is to compare the test outcomes obtained by this author using the Linear Regression (LR), Mann Kendall (MK), Spearman rho (SR) and Sen's Estimator methods to investigate the trends in rain-fall series with Modified Mann Kendall (MMK) tests. The test results obtained, is crucial for the basin to decide about the agro-based economy of the region and also the drinking water scarcity. The deviations in significant rainfall, may be responsible for identifying the natural calamities like drought and flood conditions.

Materials and methods

The study region selected is the Vaigai River Basin and considered as the second leading basin (following of Cauvery basin) based on its water share (5.68 %) to the geographic region and also one of the important basins in the state of Tamil Nadu. The geographical location of Vaigai basin lies between 90 30' and 10o10' N latitude and 77o 10' and 77o 40' E longitude. The area is dominated by South-West Monsoon (June - September) and North-East Monsoon (October - December). The climate of the basin is tropical monsoon. The rainfall data of 7 stations (Berijam (BJ), Bodynayakkanur (BN), Gudalur_M (GM), Periyakulam (PK), Uthamapalayam (UM), Vaigaidam (VD) and Veerapandi (VP)) from 1959 - 2016 years were taken from State Surface and Ground Water Data centre, PWD, Tamilnadu.

Rainfall trend analysis for the Vaigai basin catchment area has been carried out with the 58 years of precipitation records from 1959 -2016 using R statistical software. The Modified Mann Kendall (MMK) test is used for the investigation of the trend (by using yearly, seasonal and monthly the rain-fall data sets). The significance of the test statistics were investigated based on the corrected p value obtained. The following are the level of significance used in the analysis: if $p \leq 0.01$ (1% level of significance), if $p \leq 0.05$ (5% level of significance) and if $p \leq 0.1$ (10% level of significance).

Modified Mann Kendall test

Pre-whitening is being employed to detect a trend in a time series in the presence of auto-correlation [15]. However, pre-whitening is specified to lessen the rate of recognition of significant trend in the Mann Kendall test [16]. Thus, the Modified Mann Kendall (MMK)

test [17] is employed to investigate the trend in an auto-correlation series. The current investigation, the auto-correlation amongst ranks of the observations ρ_k is evaluated after subtracting an assessment of a Non-Parametric trend such as Sen's Median Slope from the data. The significant values of ρ_k is only used for computing the variance modification factor (n/n_s^*) , as the variance of S is undervalued for the positively auto-correlated data (Equation 1):

$$\frac{n}{n_s^*} = 1 + \frac{2}{n(n-1)(n-2)} \times \sum_{k=1}^{n-1} (n-k)(n-k-1)(n-k-2) + \rho_k \quad (1)$$

Where,

n denotes the actual number of observation,

n_s^* is denoted as an efficient number of observations to account for the auto-correlation within the data and

ρ_k is reflected as the auto-correlation function for the ranks of the observation.

Then, the modified variance is determined as in (Equation 2) [17],

$$V^*(S) = V(S) \times \frac{n}{n_s^*} \quad (2)$$

Where,

$V(S)$ is to be taken from Mann Kendall (MK) test equation. The rest is similar to the Mann-Kendall (MK) test.

Results and discussion

In Mann Kendall method, the Z_c (corrected) statistic for 58 years period revealed, the statistically significant +ve trends in yearly rain-fall time series for Veerapandi (VP) station (5% level of significance) and Periyakulam (PK) station (1% level of significance) and also -ve trends for the Bodynayakkanur (BN) station (5% level of significance).

For the seasonal analysis the Z_c statistics revealed that, statistically significant +ve trends were observed in Periyakulam (PK) station (at 5% level of significance) in pre-monsoon and post-monsoon periods and Veerapandi (VP) station (at 1% level of significance) in pre-monsoon period, however -ve trends were observed in Bodynayakkanur (BN) station (at 10% level of significance) in pre-monsoon period and (at 5% level of significance) in monsoon period and -ve trends were also observed in Vaigaidam (VD) station (at 1% level of significance) in both monsoon and post-monsoon periods.

The Modified Mann Kendall (MMK) test statistics for the individual months have shown statistically significant +ve trends for Veerapandi (VP) (March, April and August months) and Periyakulam (PK) stations (August month) and the stations Bodynayakkanur (BN), Gudalur_M (GM) and Vaigaidam (VD) showed statistically significant -ve trends in the month of July and the station Berijam (BJ) showed statistically significant in May month.

The outcomes of the trend analysis on yearly, seasonal and monthly Modified Mann Kendall (Zc) statistics were tabulated in Table 1 and Table 2.

Conclusions

The test results obtained based on the test conducted on the Modified Mann Kendall test have shown that the MK trend statistic value (Zc) as positive (Periyakulam station and Veerapandi station) and negative (Bodynayakkanur station) out of the identified seven rain-fall stations in Vaigai River Basin. In yearly trend study, Periyakulam and Veerapandi stations have shown significant +ve trend, Bodynayakkanur station showed significant -ve trend and the remaining stations (Berijam, Gudalur_M, Uthamapalayam and Vaigai dam) exhibited non-significant +ve / -ve trends. The test results obtained from Modified MK test is in agreement with the test results obtained from the Spearman Rho, Linear Regression, Sen’s slope estimation and shift detection methods. It has revealed an evidence of rain-fall trend variability in Vaigai River Basin for the past 58 years.

In Seasonal precipitation trends, Modified MK test showed significant +ve Zc value for the Periyakulam station during pre-monsoon and post-monsoon seasons and Veerapandi station showed significant +ve Zc value in pre-monsoon season. However, Bodynayakkanur station showed significant-ve Zc value in pre-monsoon and monsoon seasons and Vaigaidam station showed significant-ve Zc value in monsoon and winter seasons and the remaining stations (Berijam, Gudalur_M and Uthamapalayam) have shown non-significant +ve / -ve trends.

The trend statistics for the individual months have shown statistically significant +ve trends for Veerapandi station (March, April and August) and Periyakulam (August) and the Bodynayakkanur, Gudalur_M and Vaigaidam stations showed statistically significant -ve trends in the month of July and the station Berijam showed statistically significant in May

month and the Uthamapalayam station have shown non-significant +ve / -ve trends in the individual months.

The test results obtained in annual, seasonal and monthly analysis have also mostly confirming the statistically significant +ve test results obtained in Periyakulam station (Annual, Post-monsoon and August trend study) and Veerapandi station (Annual, Pre-monsoon and March, April & August trend study), and -ve test results obtained in Bodynayakkanur station (Annual, Pre-monsoon and July trend study) and the remaining stations Berijam, Gudalur_M and Vaigai (non-significant -ve test results) and Uthamapalayam (non-significant +ve results) using the Mann Kendall, Spearman rho & Sen's Slope estimation and shift detection methods conducted by Mahadevan and Ramaswamy [18,19].

The existence of trends in Vaigai basin rainfall patterns may be acknowledged to the trends; and temporal deviations (Time based deviations) detected from the analysis may be owing to climate variations and human influenced actions experienced during this period. Hence these findings will be of immense help to the water resources planners and managers in these regions.

Abstract

Stabilizing black cotton soil with spent coffee grounds means enhancing its engineering properties and addressing issues like high soil flexibility, inadequate load-bearing capacity, and erosion susceptibility. This abstract investigates how well earth can be transformed into a robust and stable building material. Through laboratory testing and field evaluations, the study assesses the effect of SCG on soil parameters, including compressive strength, cohesion, and permeability. The results offer significant perspectives on economical and sustainable methods of stabilizing soil, which are crucial for the advancement of infrastructure and preservation of the environment. When compared to untreated soil, the outcome indicates whether the physical characteristics of the soil were enhanced.

Keywords

Compressive strength, permeability, load-bearing capacity, and engineering properties.

Introduction

Soil stabilization is the process of changing soil engineering qualities through biological, chemical, or mechanical means. A technique used in civil engineering to strengthen and improve the soil's engineering properties is soil stabilization. Due to land constraints and urbanization, it is now essential to complete civil engineering projects even in areas with poor soil in recent decades. Black cotton soil is one example of a soil that lacks engineering

characteristics like shear strength and bearing capacity. Black soil is found mostly in the states of Andhra Pradesh, Karnataka, Maharashtra, Gujarat, Rajasthan, Uttar Pradesh, Madhya Pradesh, and Tamil Nadu, and it makes up about thirty percent of the country's total area. Soil is created when rocks decompose chemically or physically, and its characteristics differ from those of the parent material.

When a weight is applied, the soil is typically weak and unstable. These soils are used as pavement subgrade and in construction. Therefore, stabilizing these soils is required prior to starting construction. In order to essentially alter the qualities of soft soils and increase their stiffness and strength, the stabilization process entails adding binders or stabilizers to the weak soil.

The development of systematic techniques for stabilizing soil accelerated in the late 19th and early 20th centuries. In order to address issues with wide clay soils, low load-bearing capacity, and erosion susceptibility, engineers started experimenting with different admixtures. The mid-20th century saw an explosion in the investigation of various admixtures for soil stabilization as technical expertise grew one kind is SCG.

There has been a paradigm shift in the field of soil stabilization in recent decades toward sustainable and eco-friendly methods. This has prompted research into cutting-edge methods, such as the application of SCG, which has special bonding qualities.

The fact that soil stabilizing techniques are still evolving emphasizes how crucial it is to keep improving and adding to the arsenal of admixtures that are already accessible. The search for novel materials and techniques is indicative of a dedication to creating effective, economical, and ecologically responsible solutions for the various geotechnical problems that arise in building and infrastructure projects.

Materials and methodology

Soil: Black cotton Soil

The Hubli-Dhrawad regions, which are recognized for their expansive clay qualities, are the source of the black cotton soil used in this experiment. This soil's expansive nature is mostly due to its richness in montmorillonite clay minerals. Because of its shrink-swell behavior and high plasticity index, it is a great choice for researching how spent coffee grounds-based chemicals affect soil stabilization. The Atterberg limits of the black cotton soil

under study, which establish the soil's plastic and liquid limitations, and its natural moisture content are important characteristics. These measurements shed light on the intrinsic properties of the soil and how it reacts to outside stabilization techniques. In order to comprehend the particle composition and compaction capability of the soil, an analysis of its grain size distribution is also conducted.

Experimental Admixture: Spent coffee grounds

The end product of making coffee is used coffee grounds, which are the consequence of the brewing process. Even though they contain a number of extremely useful chemical components, spent coffee grounds are often disposed of or composted because they are considered trash. Over 15 million tonnes of wasted coffee grounds are produced annually.

CG was sourced from the waste disposal of a commercial cafe in the city of Bangalore, Karnataka. The CG was then stored in air-tight bags to avoid deterioration over an extended period of time. CG was then dried to stop organic compounds that could catch fire. According to the CG's naturally high moisture contents and low drying temperature, drying took up to five days on average. The required percentage of additives was then manually combined with the dried CG material.

Table 1 Properties of soil

Property	Value
Specific gravity	2.38
<i>Grain size distribution</i>	
Sand	4 %
Silt	70 %
Clay	26 %
<i>Atterberg Limit</i>	

Liquid limit	56.07 %
Plastic limit	21.1 %
Plasticity index	35%
IS classification	CL
<i>Compaction characteristics</i>	
Maximum dry density	1.88 g/cm ³
Optimum moisture content	22 %

Literature Review

Stiffness and deformation properties of spent coffee grounds based geopolymers by Teck-Ang Kua , Arul Arulrajah , et al:

This paper suggests that slag works more efficiently compared to fly ash for CG-geopolymer strength gain. The highest recorded UCS was 1.8 MPa, by 70CG:30S + 70Na₂SiO₃:30NaOH cured at 50 degree C for 28 days, while the corresponding 7-day strength for this mix was 1.4 MPa. This study finds that geopolymerization improves the resilient modulus and UCS of CG significantly. To ensure structural integrity, UCS plays an important role in determining the suitability of a construction material. The flexibility of a subgrade material is crucial to ensure that it does not easily deform after repeated loadings. Interestingly, curing CG + S geopolymers show decreased MR values compared to their 21 degree C values while achieving higher UCS readings, thus implying that heat treatment increases the UCS while also improving the flexibility of these green CG geopolymers. The experiments done in this study confirm that with up to 28 days of curing, the strength of CG geopolymers does not deteriorate. However, due to the presence of organic materials in CG, future studies are proposed to investigate whether the strength of the CG geopolymers deteriorates in the long term, and whether CG geopolymers may produce hazardous leachates that contaminate adjacent soils and water tables when implemented as a sub-grade material

Experimental investigation on the combined effect of the water mixing ratio and the addition of spent coffee grounds on plaster's thermo-mechanical properties by Mohamed Touil, Amine Lachheb, et al:

This study, presents an experimental investigation highlighting a new approach for the valorisation of coffee waste in construction applications. The results acquired revealed that the progressive increase of amount of coffee particles, and the water rate led to a clear improvement of the plaster's thermal qualities, but in contrast, it reduced its mechanical characteristics. The microscopic analysis showed a good compatibility between the coffee particles and the gypsum granules, which encouraged the valorisation of this class of waste in the construction industry. Including the coffee grounds reduced the plaster's density, while a rise in the W/P ratio generated more lightweight products at the building scale. With a water rate of 0.7, and 6% of residues, the density loses 22.07% of its maximal value. A direct correlation between the thermal conductivity and the corresponding density was validated. Therefore, decreasing the composite lightness necessarily declined the heat conduction and diffusion within the composites. The addition of coffee grounds to gypsum caused no change in its plastic mechanical behaviour, compared to the neat gypsum plaster. This showed that aggregates with a granular form cannot bring any sort of ductility or prevent the brittle failure of the cementitious matrix. s. Future works in this field should be oriented to the durability study of this compound in front of the thermo-hydric shocks, its resistance to the compression, its photothermal effect and also the thermal assessment of its weight change and heat flux under thermogravimetric analysis and the differential scanning calorimetry.

Strength and microstructure properties of spent coffee grounds stabilized with rice husk ash and slag geopolymers by Cherdsak Suksiripattanapong, Teck-Ang Kua, et al:

The outcome of this study provides insight on the long-term strength performance and microstructural formation of geopolymers synthesized from agricultural waste products. The maximum total unit weight of samples values increased with increases in the S content, due to the specific gravity of S being higher than that of RHA (about 1.5 times). The optimum L/P ratios were 2.4, 2.2, 2.0 and 1.8 for RHA contents of 30%, 20%, 10% and 0%, respectively.

The maximum UCS values of CG-RHA-S geopolymer were at optimum L/P ratios of 2.2, 2.0 and 1.8 for CG: RHA:S ratios of 70:20:10, 70:10:20 and 70:0:30 whereas the maximum UCS of CG-RHA-S geopolymer at CG:RHA:S ratio of 70:30:0 decreased as the L/P ratio was increased. This can be attributed to the CG-RHA-S geopolymer being micro-porous and the interaction between pore fluids. The optimum mixture ratio was determined to Fig. 8. SEM

of 70CG:10RHA:20S and 70CG:0RHA:30S specimens cured for 60 and 90 days. 318 C. RHA geopolymers require a high curing temperature of 50 degree C for optimum geopolymeric reactions to occur. The comparing the SEM images taken at 7 days and 90 days showed almost complete reduction of loose RHA and S particles to form a dense geopolymeric matrix. This highlights the importance of elevated temperature curing in promoting geopolymerization in CG + RHA geopolymers by effectively dissociating the RHA particles.

Spent coffee ground, transformation from environmental burden into valuable bioactive metabolites by Tanim Arpit Singh, Namrata Pal, et al:

The study inhibits naturally occurring substances that are biologically active is expanding all the time. Because of their use and advantages, particularly for human health, peptides are among the possible bioactive chemicals. Peptides can be found in a variety of foods that are made from both animal and plant sources; at the moment, they are found in food industry residues. Peptides with high bioactive potential were more prevalent in fermented SCG, and these peptides may be used to treat diabetes, hypertension, and oxidative stress. There is not much or scarce information regarding the bioactivity of peptides from SCG protein hydrolysates; however, some peptide fragments with hydrophobic amino acid Tyr (Y) on the C-terminal resemble that generated after thermolysis of Arabica-SCG with alcalde and gastrointestinal digestion of cofee silver-skin with pepsin and pancreatin. Despite several advantages, it is still not well explored at the industrial level to use the SCG treasure trove. Hence, more comprehensive studies are required to identify and evaluate the activity and mode of action of the peptides extracted and their in vivo bio availability. Thus, coffee can be considered a source of peptides that could aid in reducing the risks of non-communicable chronic diseases. Additionally, the protein obtained from SCG could be used as an alternative food supplement or as functional food over artificial protein sources.

Engineering and environmental evaluation of spent coffee grounds stabilized with industrial by-products as a road subgrade material by Teck-Ang Ku, Arul Arulrajah, et al:

This paper suggests that strength development of CG was assessed by UCS and CBR testing, CBR value of the various unstabilized CG mixes increases as the UCS values increase. The MDD of unstabilized CG was unaffected when additives were added from 3 to 5 %. When additives replacing CG exceeded 10 %, a trend in which the higher the additive content the higher the MDD and the lower the OMC can be observed. CG stabilized with FA

and S with additive content of 10–50 % met the requirement of CBR C2 % for subgrade materials. Comparatively, stabilizing CG with PC and L may prove to be unfeasible because additive contents of 3–5 % were insufficient in producing the desired CBR values. Additives were found to increase the UCS of CG after 28 days of curing. A recommendation for future research is to observe long-term biodegradation that may occur after the current 28 days curing timeframe. This would be required for a life cycle assessment of CG. By combining CG, FA, and S, a stabilized green material meeting structural strength benchmarks was produced for road construction purposes. Instead of disposing these wastes to increasingly scarce landfills, this study shows that it is possible to divert industrial-waste-stabilized-CG to construction sites, where fill material is needed, without adversely affecting the environment.

Study of coffee husk ash addition for clay soil stabilization by R P Munirwan1, D Sundry, et al:

The study shows The liquid limit of untreated soil is 63.0%, with the addition of coffee husk ashes, the liquid limit value then decreases up to 52.2 %. On the other hand, the plastic limit value increases slightly from 41.76 % for original soil to 44.11 % in 12% addition, even though there is a slight decrease from plastic limit 6% is 42.41 % to 8 % addition at 41.37 %. The index plasticity parameter decreases constantly from 21.24 % of untreated soil to 8.09 % for 12 % of coffee husk ashes. Commonly the Atterberg limit trend of treated soil showed good results with the cumulative percentage of coffee husk ashes. From obtained results, the combinations of coffee husk ashes and soil enhance the physical properties of soil and are potential materials to be used for soil stabilization. For example, the index plasticity of treated soil exhibits a good reduction at 8.09 for 12 % of coffee husk ashes compared with 0% soil at 21.24%. It can be expected that with further laboratory tests in soil mechanics, more soil parameters can be improved with the soil-coffee husk ashes mixing.

Nanosized spent coffee grounds can increase soil clay dispersibility by Nhung H. Do, Ha V. Mai, et al:

This study highlights a potential impact from the application of SCGs to agricultural soils. nSCGs with a hydrodynamic size of ~260 nm extracted from SCGs possessed negative surface charges and they were found to result in colloid-induced The colloidal effects of nSCGs on the dispersibility of clay were more obvious at $\text{pH} < 6$, under which condition the

edge surfaces of clays or Fe oxides may act as sorption sites for nSCGs. This implies that electrostatic competition between (–) nSCGs and (–) clay basal surfaces for (+) sorption sites in Fe oxides and clay edge surfaces stimulates the dissociation of ‘clay basal surface-clay edge surface’ or ‘clay basal surface-Fe oxides’ structures; hence, it can favour the dispersion of clay. pH and IS were identified as two major factors that govern the colloidal properties of nSCGs and clay. Other coffee components may also occur with nSCGs; however, their effects could not be detected herein. In general, it can be highlighted that the application of spent coffee grounds to soil can possibly induce soil/clay losses. Therefore, efforts to reduce clay/soil losses resulting from coffee-based additives need to be encouraged, and innovative and sustainable solutions are still needed to address the negative aspects of SCG addition.

Impact of spent coffee grounds as organic amendment on soil fertility and lettuce growth in two Mediterranean agricultural soils by Ana Cervera-Mata, Silvia Pastoriza, et al:

The two soils assayed had different agronomic characteristics but in both of them the effects of SCG addition were similar and proportional to the dose assayed. However, the addition of SCG gave rise to significant differences in pH, EC25 and nutrient status for both soils. Thus, it is necessary to consider the soil type in every experiment performed with SCG. SEM observation revealed that the SCG particles were incorporated into the soil mass and that microorganisms developed upon the particles. The addition of SCG limited the growth of lettuces, although the causes of growth limitation require further study. With regard to cultivation time, it was found that the addition of SCG resulted in a relative increase in the dry weight of lettuces (greater degree of mineralization), which may have nutritional benefits. In the case of the soils, assay time (60 days) decreased EC25 and C/N ratio, which would be beneficial from an agronomic point of view. The use of SCG in agricultural soils has clear agronomic and environmental benefits.

Spent coffee grounds by-products and their influence on soil C-N dynamics Ana Cervera-Mata, Gabriel Delgado, et al:

The study shows a clear relationship has been demonstrated between the properties of the tested bio amendments and their effects on the C and N cycles. SCG, SCGd and hydrochars are bio-residues that stimulate soil biological activity, due to the fact that they

contain easily decomposable carbonaceous molecules. The hydrothermal carbonization process (generator of hydrochars) accentuates this characteristic. As a consequence, SCG and hydrochars lead in the short and medium term to N immobilization, lower organic C conservation in the soil and to CO₂ emissions in the atmosphere. The pyrolysis of SCG, which gives rise to biochars, removes much of the easily decomposable C from these residues, leading to less N immobilization and greater fixation of organic C in the soil. Therefore, the two thermal transformation pathways lead to wastes with divergent characteristics and effects on the soil. The vermicomposting of SCG generates a product with stable carbonaceous molecules, but with a high content of different forms of N. It is the only one of the SCG by-products that does not generate N immobilization and can even be considered as a N fertilizer. All tested materials did not cause an increase in N₂O emissions. The results of the present study showed the potential of SCG by-products as effective organic amendment. Moreover, depending on their properties, they can be used to fulfil specific agronomic and ecosystem service functions. Further research on the impact of SCG by-products residues on soil quality and fertility and crops are needed to evaluate their safety, trade-off between agronomical and environmental purpose and the identification of the material best suited for a specific aim.

TESTS

The following characteristics of natural black cotton soil have been determined through laboratory testing:

- Specific gravity
- Atterberg Limits (Liquid limit, Plastic limit)
- Plasticity Index
- Maximum dry density
- Optimum moisture content

Methods used in laboratories to assess spent coffee grounds performance as an admixture at various concentrations:

- Liquid Limit
- Plasticity Index
- Shrinkage Limit

- Maximum Dry Density, MDD
- Optimum Moisture Content
- Unconfined Compressive Strength

Conclusion

From an experimental study investigating the use of spent coffee grounds for stabilizing black cotton soil, several inferences can be drawn. Experiments likely demonstrated improvements in soil properties such as increased strength, increased plasticity, improved compaction characteristics, and enhanced resistance to erosion and shrinkage. Given that spent coffee grounds are a waste product, their use for soil stabilization suggests an environmentally sustainable approach to waste management and soil improvement. The use of spent coffee grounds may be cost-effective compared to traditional stabilizing agents, offering a potentially cheaper alternative for soil improvement.

Further Research

Subsequent investigations on the effectiveness, viability, and longevity of employing used coffee grounds to stabilize the soil of black cotton could concentrate on a number of important areas .

ABSTRACT

An extensive summary of studies on behavior of Reinforced Concrete (RC) beams containing various types of openings. To check the structural integrity of beams, with circular and elliptical openings. In modern structures many pipes and ducts are used for accommodation of essential utilities like air conditioning, electricity, internet and telephone. Installing all of these can take up a lot of space, leaving behind empty areas that serve no purpose. To avoid this waste, builders can create a transverse passage through the beam to accommodate the pipes and ducts, reducing the amount of unused space. Carbon fiber reinforced polymer (CFRP) is a prevalent choice for external reinforcement to meet the strength requirements associated with flexural and shear forces in structural systems, using different wrapping techniques.

KEY WORDS

CFRP, CORECUTTING, Binding Material (base, hardener), RC Beams, Compressive Strength

INTRODUCTION

In practical situations, it may be necessary to create openings in certain parts of a building, such as ceilings or beams, to allow utility lines to pass through using ducts and canals. However, this process can result in a decrease in stiffness due to concentrated stresses that arise from the cracks that form at the edges of the openings, altering the cross-section dimensions. This reduced stiffness can lead to high deflection, whereas this study focuses

on the behavior of elliptical openings in RC beams. Previous research has explored the use of openings in concrete structures, with some studies investigating elliptical shapes.

Opening in beams are required to accommodate essential services such as AC ducts, water supply, electricity and heating ducts. The presence of an opening in RC beam reduces its load carrying capacity and increases its service load deflection and cracks in the building. The ducts and pipes are usually placed underneath the soffit of the beam. The passages of ducts in floor beam leads to reduction in dead space which can lead to a substantial savings for a multi storey building. The opening may be of different shape and size such as circular, elliptical etc. Studying the influence of transverse openings with different shapes in beam for the first cracking load and predict load-deflection behavior of beams with and without core-cut openings, flexural strength of beams with varying core-cut openings for CFRP sheathing. By providing optimum opening in beam with respect to shape, location strengthened by CFRP without compromising on its overall performance.

LITERATURE REVIEW

KHATTAB SALEEM ABDUL-RAZZAQ et al. (2017)

This paper presents a review of the results of some previous research studies on reinforced concrete T-Beams that have openings in their webs and flanges. The effect of size, shape, location and number of openings on the behaviour was investigated. Strengthening of these openings was also explored as well. Because of unexpected changes in the configurations of the T-Beam section, corners of the opening are subjected to high stress concentration that may cause unacceptable cracking from durability and aesthetic viewpoints. It is clear that making openings in T-beams changes the simple behaviour of beam to a more complex one. From the existing research works, it was pointed that the existing of openings, either in web or flange, causes a reduction in the cracking load, the ultimate capacity and the stiffness. T-beams with large rectangular openings or with multiple web openings behave like a Virendel. Strengthening of these openings with carbon fiber reinforced polymer (CFRP) increases the beams ultimate capacity and delays the crack appearance in addition to reducing the crack width.

BASHIR OSMAN et al. (2018)

The introduction of openings into reinforced concrete (RC) elements leads to reductions in the element's overall structural capacity and stiffness. These reductions attributed to stresses concentrations and local cracking at the openings region. This paper presents a study aimed at investigating the influence of web openings at shear span of RC beam on its shear behavior. A total of three beams with circular openings and one beam without opening were fabricated and tested. The opening location and size, and shear span-to-depth ratios, were considered as the main parameters. The FE model using ANSYS14.5 software was calibrated with the experimental results to ensure that the simulation process is correct. Furthermore, the specimens were analysed using ANSYS14.5 with considering the above mentioned parameters. The results showed that the early collapse of the beam occurred when the openings located in a high shear region.

KHATTAB SALEEM ABDUL-RAZZAQ et al. (2017)

This paper presents a review of the results of some previous research studies on reinforced concrete T-Beams that have openings in their webs and flanges. The effect of size, shape, location and number of openings on the behavior was investigated. Strengthening of these openings was also explored as well. Because of unexpected changes in the configurations of the T-Beam section, corners of the opening are subjected to high stress concentration that may cause unacceptable cracking from durability and aesthetic viewpoints. It is clear that making openings in T-beams changes the simple behaviour of beam to a more complex one. From the existing research works, it was pointed that the existing of openings, either in web or flange, causes a reduction in the cracking load, the ultimate capacity and the stiffness. T-beams with large rectangular openings or with multiple web openings behave like a Vierendeel. Strengthening of these openings with carbon fiber reinforced polymer (CFRP) increases the beams ultimate capacity and delays the crack appearance in addition to reducing the crack width.

BASHIR OSMAN et al. (2018)

The introduction of openings into reinforced concrete (RC) elements leads to reductions in the element's overall structural capacity and stiffness. These reductions attributed to stresses concentrations and local cracking at the openings region. This paper presents a study aimed at investigating the influence of web openings at shear span of RC beam on its

shear behavior. A total of three beams with circular openings and one beam without opening were fabricated and tested. The opening location and size, and shear span-to-depth ratios, were considered as the main parameters. The FE model using ANSYS14.5 software was calibrated with the experimental results to ensure that the simulation process is correct. Furthermore, the specimens were analysed using ANSYS14.5 with considering the above mentioned parameters. The results showed that the early collapse of the beam occurred when the openings located in a high shear region.

KHALED FAWZY et al. (2016)

This paper displays the numerical study on fortifying reinforced concrete (RC) beams with opening exposed to unadulterated torsion. The finite elements implemented by ANSYS-2013 are used for this study. For the purpose of confirmation of the finite element model established, the numerical study is first carried out on the RC beam fortifying by external bonded-carbon fiber reinforced polymers (EB-CFRP) that were experimentally tested and described in the literature. Then the study has been stretched for the same RC beams fortifying with steel plates. The major parameter involved in this study is the fortifying effect of different schemes of steel plates and the plate's thickness on the behaviour of RC beams with opening underneath torsion. The present study reveals that the finite element models can ascertain the structural behaviour of the tested beams and can be an excellent alternative of damaging laboratory tests with acceptable results, and the steel plates are more effective in strengthening the RC beams compared to the strengthening with (CFRP) for some schemes.

DR.MOHANNAD HUSSAIN AL-SHERRAWI et al. (2016)

In this study, a three dimensional finite element analysis was utilized to study the behaviour of reinforced concrete T-girders with and without web openings under pure torsion by using ANSYS APDL 15.0 program. Fourteen reinforce concrete T-girders were analysed; one of the girders (without web openings) was model as a control girder. The analysis variables considered for the other girders are: size, shape, position of web openings, number of web openings and the method was used to strengthen the member at openings, (using internal deformed steel bars as in the case where the openings are planned before casting the girders). To study the general behaviour of finite element models, torque-angle of twist plots at the end of the span near the loaded arms were represented. From this

relation, it was showed a decreasing in the strength of the T-girders with web openings under the torsional loads and increasing of the angle of twist. The results were analysed in terms of torque twist characteristics; ultimate torque, crack patterns, crack width, warping and stresses.

G.M. HEKAL et al. (2020)

Transvers openings in beams decreases the torsional strength and the reduction depends onthe area of the opening .All strengthened techniques improved the results of the torsional strength, ductility, and energy absorption with the corresponding reference specimens For reference RC beams, R30*6, R30*12,R60*6, and R60*12, ultimate torques were decreased due to openings with respect to beam without opening, R0 by about 43%, 51%, 51%and 60% respectively. The ultimate torques for S30*6, SD30*6,SB30*6 and C30*6 were increased with respect to the corresponding reference specimen R30*6 by about 40%, 138%, 76%, and 176%respectively.The ultimate torques for S60*12, SD60*12,SB60*12 and C60*12 were increased with respect to the corresponding reference specimenR60*12 by about 23%,131%,57% and 157% respectively.

QASIM M. SHAKIR et al. (2019)

This study aims to investigate experimentally the behaviour of self-compacting reinforced concrete beams with in-plane loaded openings strengthened with different techniques in the opening zone. The experimental program consists of testing five specimens with a rectangular opening at the midspan, one of the beams serves as a control beam (without strengthening), and four beams are strengthened at the opening zone with several methods including steel fibers, semi-rhombus crossed bars, jacketing with steel plates, and utilizing the composite section technique. The response has been discussed in terms of the first cracking load, ultimate load, maximum deflection, failure modes, loading history, crack patterns, toughness value, ductility index, and crack width to recognize the best strengthening proposal opening. Test results indicate that the technique of strengthening the WT-rolled steel recorded an increase in the ultimate load capacity, toughness, and ductility.

MOHAMED MAKHLOUF at el. (2018)

This paper presents the torsional behaviour of R.C. beams strengthened with externally steel stirrups, steel links and Fiber Reinforced Polymers (FRP) systems, R.C beams with web opening subjected to pure torsion. A total six rectangular beams were tested. Two un-

strengthened specimens without and with web opening, which considered as control specimen, the rest four beams with web opening which one specimens strengthened with external steel stirrups, one specimen strengthened with steel links, one specimen strengthened with external stirrups made from Glass Fiber Reinforced Polymer (GFRP), and one specimen strengthened with external stirrups made from Carbon Fiber Reinforced Polymer (CFRP). All the beams were subjected to pure torsion till failure. The type of strengthening material and system is the basic parameter in this study. The experimental results showed a noticeable increase in torsion resistance for the strengthened specimens compared to control specimen.

IBRAHIM HAKEEM et al. (2019)

The present study pertains to the effects of transverse opening diameters and shear reinforcement ratios on the shear and flexural behavior of RC beams with two web openings across different spans, i.e., a single opening in each half-span. Within the scope of the study, a total of 12 RC beams with five different opening diameter- to-beam depth ratios (0, 0.20, 0.27, 0.33, 0.40, and 0.47) and two shear reinforcement ratios were tested to failure under four-point bending. The load capacities, ductility, rigidities and energy dissipation capacities in the elastic and plastic ranges of beam behaviour were compared. Furthermore, the load capacities of the beams were compared to the existing analytical shear strength formulations in the literature. The test results indicated that whether an RC beam with openings has adequate or inadequate amounts of shear reinforcement, the frame-type shear failure becomes much more pronounced with increasing opening diameter.

SATTAINANTHAN SHARMA et al. (2015)

Reinforced Concrete (RC) beams are essential structural elements that transfer loads from the slabs to the columns through flexure and shear. Openings in Reinforced Concrete (RC) beams are required for a variety of architectural and mechanical reasons. The purpose of this article is to investigate the flexural behaviour of an RC beam with circular openings running the length of it. The three-dimensional nonlinear finite element method was used to investigate a supported RC beam with circular web openings of varying diameters using ANSYS, a finite element software package. The study's primary characteristic is the variation in diameter and location of reinforcement around the openings. Five RC beams with simple supports were constructed, and tested were conducted under two- point loads. Beams were

constructed with one conventional specimen without any openings in beams and two beams with unstrengthen circular openings located in the flexure zone with varying diameters such as 80mm.

NOOR RAHAMAN BIN YAHYA et al. (2014)

Research and study in comparing the behaviours between solid deep beam and deep beams with web openings with the same cross-section and reinforcement had been made before. Some research found that web opening deep beam couldn't resist an extra loadings compared to solid beam which can stand and bear the excess cargo. Thus, this chapter review of the characteristic web opening deep beams and how much the size of opening affects the deep beams. The behavior of the beam was known depending on the opening size on the deep beam and this chapter review the explanations on the square opening deep beams behaviour and from those the suggestion and recommendation to increase the concrete square opening deep beams behaviour was observed.

ABHINAV GUPTA et al. (2023)

The effects of opening transverse direction in reinforced concrete beams have been studied. In this research, we observe that reinforced concrete beams with openings of different horizontal location and reported that placing holes in flexure zone has lesser impact on the beam performance compared to when the castellations are placed in the shear zone. Based on the vigorous effort made in this area the following conclusions are drawn: 1) It could be concluded that the usage of circular-shaped openings is more effective than other shapes of openings since it avoids sharp edges, which are subjected to high-stress concentration while loading. 2) It is recommended to have a circular opening less than 0.55 D of the beam for web opening. The size of the opening to be restricted within 0.5D of the beam. The other shapes of web opening; Increase in size of opening decreases the mechanical properties of the beam, and it leads to the change in the mode of failure. 3) It can be concluded that, for web opening in RC beams, the optimum position to have opening at mid-depth and the center between the support and load point to reduce the changes made in the beam due to opening. 4) When the opening location moves towards the point of application of load or towards the support, there will be an occurrence of reduction in its load-carrying capacity. 5) It is proposed to select the strengthening materials based on the purpose, availability, cost, availability of skilled labour and time.

MANSUR M.A et al. (2014)

Describes analysis at service load of reinforced concrete beams that contain large rectangular openings in the webs. In the analytical modeling, the beams are treated as structural members comprising several segments, and an equivalent stiffness has been derived for the segments traversed by the openings. The beams are then analysed by the direct stiffness method. Results from tests of 22 beams available in the literature are compared with the calculated deflections and support reactions under service load. In general, a good agreement has been obtained.

ARPIT JAISWAL et al. (2016)

The basis of this study is the serviceability requirement which arises long after the structural erection has been completed. Beams with web openings can be competitive in such cases, even though more alternatives to solid web beams such as stub girders, truss etc. are available and height limitation is a common problem faced by designers in multi-story buildings due to economic requirements and aesthetical considerations. Substantial spaces are normally required to enable the passage for large pipes and ducts beneath steel beams which leads to uneconomic floor heights. Though web openings could lead to a significant decrease in beam's load carrying capacity depending on the adopted openings shape, size and location but can also be very helpful and important from the point of economy. So this study is concerned with the influence of the web opening on the strength of compressive elements and web crippling strength of steel sections. And the parametric analysis to be focused on size and location of opening.

N.Y ELWAKKAD et al. (2018)

The paper will present the state-of-the-art of the different ways for strengthening of existing reinforced concrete structures including both traditional and advanced strengthening materials. Steel and FRP composites are the most used material in strengthening process of existing concrete structures. Near surface mounting techniques for strengthening of existing structures will be discussed. The NSM technique has provided a significant increment of the load at serviceability limit state, as well as, the stiffness after concrete cracking.

MOUSTAPHA IBRAHIM ARY et al. (2012)

Fiber-Reinforced Polymers (FRP) are used to enhance the behaviour of structural components in either shear or flexure. The research conducted in this paper was mainly focused on the shear-strengthening of reinforced and prestressed concrete beams using FRP. The main objective of the research was to identify the parameters affecting the shear capacity provided by FRP and evaluate the accuracy of analytical models. A review of prior experimental data showed that the available analytical models used to estimate the added shear capacity of FRP struggle to provide a unified design equation that can predict accurately the shear contribution of externally applied FRP. In this study, the ACI 440.2R-08 model and the model developed by Triantafillou and Antonopoulos were compared with the prior experimental data. Both analytical models failed to provide a satisfactory prediction of the FRP shear capacity. This study provides insights into potential reasons for the unsatisfactory prediction.

SUKUMAR V et al.

The strength of RC structural elements shall be increased by various methods to extend its life time. External jacketing of the elements with steel, ferrocement, FRP etc., were under research for the past decade. In general the bonding is done on all three sides or at the bottom of the beam alone. However the effect of having FRP laminates on the bottom of the beam in strip pattern (3 numbers of strip of 30mm for 150mm width of the beam). The present study focuses on the effect of strengthening the beam with Glass Fiber Reinforced Polymer [GFRP] (full width of beam) and Hybrid Fiber Reinforced Polymer [HFRP] (in strip pattern). It is observed that HFRP (strip pattern) takes almost equal amount of load for first crack formation.

RAKESH DIGGIKAR et al. (2013)

In the construction of multi-story buildings the opening in beams are provided for utility ducts and pipes. Providing an opening in beam develops cracks around the opening due to stress concentration. In this paper the behaviour of R.C.C. beam with rectangular opening strengthened by CFRP and GFRP sheets were studied. This paper presents the behaviour of R.C.C beam with rectangular opening strengthened by CFRP and GFRP sheet with different techniques. In this experimental study a total ten beams were casted one beam without

opening (ie, solid beam) and one beam with rectangular post opening and these two considered as a control beams for comparison.

SIEW CHOO CHIN et al. (2014)

This paper presents the review of studies performed to investigate the behavior of Reinforced Concrete (RC) beams containing different types of openings. For the last 4 decades, research works involved the investigation of the member strength and development of the design approach for simply supported, continuous and T-beams containing large rectangular openings subjected to torsion, bending and shear forces. The proposed design method suggested the installation of diagonal steel reinforcement bars around the opening for providing the required strength. In recent years, Fiber Reinforced Polymers (FRP) have been widely used as an external bonded reinforcement system for upgrading and retrofitting of concrete structures. FRP as externally bonded reinforcement mainly used to repair and retrofit the damaged reinforced concrete member.

M IMRAN et al. (2016)

This paper is intended to review existing literature related to RC beams strengthened for flexure, shear and torsion in order to better understand the behaviour. Review of literature shows that strengthening of RC beams using Carbon Fibre Reinforced Polymers (CFRP) are the most widely and suitable strengthening technique. Moreover, behaviour of RC beams subjected to under torsion, flexure and shear individually as well as in combination of flexure-shear has been widely studied till date. Strengthening of RC beams exhibiting these behaviours is also discussed in detail which shows that number of CFRP strips improve flexural strength whereas inclined CFRP wraps are best suitable to improve shear and torsion behaviour. However combine effects of all behaviours ie. torsion, flexural and shear have not been together studied so far. Moreover, there is no suitable strengthening technique for RC beams that exhibit these behaviours.

NURBAIAH M N et al. (2017)

Strengthening is a way to lengthen the serviceability of building structures under increased loading requirements and severe conditions. Externally bonded (EB) is one of the strengthening techniques that is being practiced nowadays. The present investigation is studying on the enhancement in flexural performance and the effectiveness of un-cracked RC beams strengthened with Externally Bonded (EB) Carbon Fibre Reinforced Polymer

(CFRP) sheet's U-wrap anchorage systems with different locations and dimensions. A series of RC beams were fabricated with the dimensions of each beam as 170 mm width x 270 mm depth x 2325 mm length. Five (5) variables were involved in this investigation. All beams were tested under four point bending. Test results show that the strengthened RC beams performed better than control beam with nominal increase in stiffness and higher ultimate load. The results show that the strengthened beams increase the flexural strength up to 35% and decrease the deflection to about 40% as compared to the control beam.

SULABH H. BAGDE et al. (2018)

In this paper presents an experimental study conducted to examine the effectiveness of Fibre Reinforced Polymer (FRP) composites in enhancing the flexural capacity of concrete beams. In this study, Fibre- reinforced polymer (FRP) application is a very effective way to repair and strengthen structures that have become structurally weak over their lifespan. Externally reinforced concrete beams with epoxy-bonded FRP sheets were tested to failure using a symmetrical two point concentrated static loading system. The results show that the FRP strengthened beams exhibit increased strength, deformation capacity, ductility and composite action until failure.

SAVAS ERDEM et al. (2017)

The use of Glass Fiber Reinforced Plastic (GRP) reinforcements in Reinforced Concrete beams as bending reinforcements has accelerated. In this study; two GRP reinforcements which have different surface characteristics and a standard steel reinforcement are used to prepare nine reinforced concrete beams for the flexural behaviour. Beam samples which are built with GRP reinforcements and steel reinforcements have been held to four pointed bending test. The results showed that considering the GFRP bars, ribbed GFRP bars showed the best displacement capability such bars may be used in high seismic zone with strengthening. In addition, the bending strength of concrete beams reinforced with GFRP bars is neither too close nor too far from the bending strength of concrete beams reinforced with conventional steel.

RENATA KOTYMIA et al. (2015)

This paper presents experimental results and a numerical analysis of the reinforced concrete (RC) beams strengthened in flexure with various externally bonded carbon fiber-reinforced polymer (CFRP) configurations. The aim of the experimental work was to

investigate the parameters that may delay the intermediate crack de bonding of the bottom CFRP laminate, and increase the load carrying capacity and CFRP strength utilization ratio. Ten rectangular RC specimens with a clear span of 4.2 m, categorized in two series, were tested to evaluate the effect of using the additional U-shaped CFRP systems on the intermediate crack debonding of the bottom laminate. Two different configurations of the additional systems were proposed, namely, continuous U-shaped wet layup sheets and spaced side-bonded CFRP L-shaped laminates.

YASMIN MURAD et al. (2018)

The use of carbon fiber reinforced polymer (CFRP) sheets is becoming a widely accepted solution for strengthening and repairing reinforced concrete (RC) structures. To date, the behavior of RC beams, strengthened with 60 and 45 inclined CFRP sheets, has not clearly explained. An experimental program is proposed in this paper to investigate the flexural behavior of RC beams strengthened with CFRP sheets. CFRP sheets were epoxy bonded to the tension face to enhance the flexural strength of beams inducing different orientation angles of 0°, 45, 60 and 90° with the beam longitudinal axis. The study shows that strengthening

RC beams with CFRP sheets is highly influenced by the orientation angle of the sheets. The orientation angle plays a key role in changing the crack pattern and hence the failure mode. The influence of CFRP sheets was adequate on increasing the flexural strength of RC beams but the ductility of the beams was reduced.

AHMED M. KHALIFA et al. (2016)

The near surface mounted (NSM) fiber reinforced polymer (FRP) reinforcement is emerging as a promising alternative strengthening technique to externally bonded reinforcement (EBR) for increasing the load carrying capacity of reinforced concrete (RC) members. NSM FRP technique has several advantages, in comparison to the EBR method, such as reducing the risk of debonding, and a better protection from the external sources of damage. In this research, the performance and effectiveness of the NSM and EBR techniques for the flexural strengthening of RC beams is compared. In order to achieve this objective, six full-scale, RC beams were strengthened with different carbon FRP (CFRP) schemes and tested. Such beams were designed to fail in a flexural mode. Test results indicated that if the same amount of CFRP is used, beams strengthened with NSM strips achieved higher ultimate load than those strengthened with EBR. Such increase in the ultimate load ratio

ranged between 12% and 18%. Furthermore, a design approach for computing the moment capacity of RC flexural members strengthened with NSM CFRP strips is developed and presented in this paper.

Wael Ibrahim et al. (2014)

In this paper, the results of an experimental investigation on reinforced concrete (RC) rectangular beams strengthened in flexural with near surface mounted (NSM) laminate strips made of carbon fiber-reinforced polymer (CFRP) are presented and discussed. The experimental program involves four tests to study the influence of the reinforcement ratio (AppAs) on the behavior of RC beams reinforced with steel bars (As) and strengthened with near surface mounted carbon strips (Arne) on stress limitation and crack control under service loadings is discussed. The strengthening with NSM strips significantly increases ductility and tension stiffening of RC beams strengthened with CFRP strips. In addition, it significantly reduces the crack width in RC members.

MAIS MALALLAH KARIM et al. (2017)

This paper presents a review of the results of some previous research studies on reinforced concrete T-Beams that have openings in their webs and flanges. The effect of size, shape, location and number of openings on the behavior was investigated. Strengthening of these openings was also explored as well. Because of unexpected changes in the configurations of the T-Beam section, corners of the opening are subjected to high stress concentration that may cause unacceptable cracking from durability and aesthetic viewpoints. It is clear that making. Openings in T-beams changes the simple behaviour of beam to a more complex one. From the existing research works, it was pointed that the existing of openings, either in web or flange.

HUSSEIN ABDEL BAKY et al. (2008)

The application of externally bonded carbon fiber-reinforced polymer (CFRP) strips for the flexural strengthening of reinforced concrete beams is known to delay the cracking moment and mitigate the development of cracks (FIB 2001; ACI 2002; Neubauer and Rostásy 2001; Kötynia 1999). Experimental tests have indicated that debonding of the bottom strip from the concrete surface is the most common mode of failure for concrete beams strengthened in this manner. This type of failure generally limits the strength utilization ratio of the

strip, ie., the ratio of the strain in the FRP at failure to its ultimate strain (Kotynia 2000; Kaminska.

TOM GEORGE et al. (2017)

The major problems of construction industry are the deterioration of concrete structures. Replacement of deficient structure makes a large amount of public money and time. Strengthening has become an acceptable way of improving the load carrying capacity. In this study the properties of reinforced concrete beams strengthened with Glass Fiber Reinforced Polymer (GFRP) are compared with control beams. A nominal mix of M20 is designed for the study. Strengthening is mainly divided into two schemes. In the first scheme flexural strengthening is done with EBR and NSM technique using GFRP sheet and strips. In the second scheme, shear strengthening is done with EBR and NSM technique using GFRP sheet and strips. A two point loading system was adopted for the test. At the end of each load increment deflection was observed. Behaviour of strengthened beams and control beams are compared by comparing the properties such as first crack load, ultimate load and load deflection.

CONCLUSION

The solid beam showed a typical flexure failure under pure bending conditions. All the other beams with openings failed due to shear cracks along the perimeter of openings irrespective of the presence of CFRP. However, the load at which the first crack appeared was varying for different cases. In contrast to circular opening, the fracture propagation rate is much quicker in beams with rectangular openings. The elliptical shaped opening in the beam without CFRP has the lowest load bearing capability with high deflections as per the experimental investigation. There was no much difference among the ultimate strength obtained between BRRFIO and BREFIO beams. Due to the use of CFRP in and around (U-wrap) the opening there was strengthening of beam of by 75.5% and 42.43% in case of beam with elliptical and circular opening respectively. The following study has given the safety guidelines that may be used for the real-time infrastructure problems.

Abstract

Cement production became responsible for polluting the atmosphere through the emission of greenhouse gases. Nano silica produced from physically-processed white rice husk ash agricultural waste can be incorporated into geopolymer cement-based materials to improve the mechanical and micro performance. Geopolymer cement is eco-friendly. It increases the strength, durability, and resistance to attack in peaty/acidic environments. It is proposed to determine and compare the differences in properties of Ferro cement geopolymer concrete with Nano silica. The investigation is to be done by using several tests which include a workability test, sieve analysis, specific gravity test, compression test, and flexural strength. Nano silica was then added to the optimum geopolymer concrete sample by ratios 1, 2, and 3% of the total weight of cement materials. Samples tested for mechanical properties. The results showed that using a hot activator and oven-curing. samples gives higher mechanical properties. Also using nano-silica up to 2% increases the compressive strength up to 24% at age 28 days.

Introduction

Concrete, after water, is the second most useful material for the construction industry. Every year, 25 billion tons of concrete are produced worldwide, acquiring 2.6 billion tons of cement, which will increase by 25% over the next ten years. Cement production has a negative impact on the environment because one ton of cement emits one ton of CO₂ into the atmosphere, alarming the ecology. However, cement-based concrete remains the most

widely used material in the global building industry. Therefore, all nations have become mandatory to consider CO₂ emission regulations and reductions. As a result, extensive research has been conducted to develop a new material that can be used as an alternative to Portland cement; among them, geopolymer technology was developed in France by Professor Davidovits. Due to the high consumption of waste materials in mixed proportions, GPC emits approximately 70% less green gas than conventional concrete. Geopolymers are an inorganic aluminosilicate polymer family produced through alkaline activation of various aluminosilicate virgin or waste materials rich in silicon and aluminium. The mixed proportions of the GPC consist of aluminosilicate source binder materials, fine and coarse aggregates, alkaline solutions, and water. The polymerization process consists of four main steps: dissolution, condensation, polycondensation, and crystallization of the gels, between the alkaline solutions and source binder materials, produced solid concrete, like traditional concrete composites. Sodium hydroxide and sodium silicate are commonly used alkaline activators to create geopolymer composites. These two activators were produced commercially, so they have adverse effects on environmental issues; therefore, it is essential to use activators that between the alkaline solutions and source binder materials, produced solid concrete, like traditional concrete composites. Sodium hydroxide and sodium silicate are commonly used alkaline activators to create geopolymer composites. These two activators were produced commercially, so they have adverse effects on environmental issues; therefore, it is essential to use activators that were made cleanly and environmentally friendly such as a mixture of NaOH and glass waste and a mixture of olive biomass ash and water.

Production of Portland cement is highly energy intensive and is also an obvious contributor to carbon dioxide emission in the environment.

- To increase the sustainability of concrete and step towards a clean environment, the replacement of cement with by-product materials is the most important.
- Nano silica which is produced from silica sand has been shown to be more effective in enhancing the strength of concrete by filling the minute pores in the concrete.

With the addition of sodium hydroxide-based alkaline solution, high-strength concrete can be developed using fly ash.

Methodology

This study is divided into three sections: review, modelling, and experimental work. To gather information about geopolymer concrete incorporated NPs, an extensive search of several databases, including Research Gate, Science Direct, Google Scholar, Scopus, and the Web of Science, was conducted. It was discovered that a wide variety of NPs, including NS were used to improve various properties of GPC composites, with NS being the most commonly used. As a result, in this study, the authors use articles that used NS to improve various properties of GPC composites to create the models. However, all GPC papers containing NPs were taken into account for the review process. In the modelling process, eleven input parameters were used, limiting the authors' ability to utilize a more significant number of data in the created models. The gathered datasets were statistically analyzed and classified into three groups. The models were built using the larger group, including 135 dataset.

Mix Proportions

In this study M25 grade of concrete was selected and OPC 53 grade of cement was used. The Table 1 shows the properties of materials.

Figure 1: Materials used

Mix Proportions and Curing

From the various different trial mixes, this mix proportion has been adopted for the study.

Total aggregates percentage taken as 70%

Heat curing in the oven, at 60°C

Nano-silica with 0%, 0.5%, 1%, 1.5% and 2%.

Nano-Silica

Nano silica, also called quartz dust or silica dust, is a material that, like SF, is characterized by its high SiO₂ percentage, over 99%.

Conclusions

It can be concluded that the addition of nano-silica did not increase the tensile strength of the cement paste but actually decreased it. However, the inclusion of 1, 2, and 3% of wt. of nano-silica made the geopolymer cement paste better in the face of failure, that the collapse did not occur suddenly. This is consistent with what was reported by where the inclusion of nanosilica in the geopolymer cement paste gave rise to a residual stress phrase after failure. The cause of the emergence of residual stress is because the nano-silica was able to fill the pores and form a good matrix with epoxy. However, the nano-silica could not withstand the tensile load after cracking, so that the maximum tensile strength dropped. Therefore, the addition of nano-silica is recommended because it can increase the residual strength.

Abstract

Self-healing concrete has emerged as a promising solution to mitigate the detrimental effects of cracks in structures. This study investigates the effectiveness of Bacillus Subtilis bacteria in reducing crack formation and enhancing the strength of concrete, supplemented with Bagasse ash. Bagasse ash of 5%, 10%, and 15%, a waste material from sugarcane processing, is utilized as a sustainable additive to improve the mechanical properties of concrete. Bacillus Subtilis bacteria are introduced into the concrete matrix of 10ml, 20ml, and 30ml to produce calcite precipitation, facilitating crack healing for M-25 mix. Through a series of experiments, including mechanical testing and microstructural analysis, the impact of Bacillus Subtilis and Bagasse ash on crack reduction and concrete strength enhancement is assessed. The results demonstrate the potential of this innovative approach to develop self-healing concrete with improved durability and sustainability, paving the way for resilient infrastructure construction practices.

Keywords

Bacillus Subtilis, Bagasse Ash, Calcite Precipitation, Self-healing.

INTRODUCTION

Concrete is a fundamental building material known for its durability and strength. However, it is susceptible to cracking over time due to various factors such as loading, shrinkage, and environmental conditions. The development of self-healing concrete has emerged as a promising solution to mitigate these issues, offering the potential to repair cracks autonomously, thus prolonging the lifespan of concrete structures [1,3].

In this study, we explore the incorporation of bagasse ash and *Bacillus Subtilis* bacteria as key components in enhancing the self-healing properties of concrete. Bagasse ash, a byproduct of sugarcane processing, is rich in silica and possesses pozzolanic properties that can contribute to the strength and durability of concrete. *Bacillus Subtilis*, a naturally occurring bacterium, produces calcite precipitation that can seal microcracks within the concrete matrix, promoting self-healing[6,8].

Bagasse Ash Proportion

- Investigation of 5%, 10%, and 15% BAGASSE ash content in concrete mixtures.
- Evaluation of compressive strength variations with different ash proportions at interval of 7,14 and 28 days.
- Durability testing to assess resistance to environmental factors such as freeze-thaw cycles test [2].

Influence of *Bacillus Subtilis* Concentration

- Incorporation of 10ml, 20ml, and 30ml *Bacillus Subtilis* by volume in concrete specimens.
- The period of crack healing was maintained at 28 days and Examination of the self-healing potential through crack closure and regeneration by means of calcite precipitations[1].
- Quantification of bacterial activity and its impact on concrete mechanical properties.
- Assessment of long-term durability under simulated service conditions.
- Analysis of microstructure using vernier caliper to observe the morphology and distribution of calcite precipitation by *Bacillus subtilis* particles within the concrete matrix[5].
- In comparison to traditional chemical self-healing concrete, the microbially induced calcium carbonate (MICP)-based bio self-healing technique provides a long-term and ecologically benign solution to cracking. MICP production occurs in the presence of CO₂, which is basically produced from the precursor used in bio-concrete. Different types of precursors are used by scientists to obtain CaCO₃. The most common precursors include amino acid salt and urea[3,7].

- But after increase the micron size of the Bacillus subtilis at correct medium, it shows the high results without inducing any other foreign substance [1].

MATERIALS

Bagasse Ash

Bagasse ash is a byproduct of sugarcane processing. When incorporated into concrete, it can enhance its self-healing properties due to its pozzolanic nature, which means it reacts with calcium hydroxide to form additional calcium silicate hydrate (C-S-H) gel, contributing to the repair of cracks.

Figure 1: Bagasse Ash

Bacillus Subtilis

Certain strains of Bacillus bacteria, such as Bacillus subtilis, have been found to produce calcium carbonate (CaCO_3) in the presence of calcium ions and carbonate ions, which are typically abundant in concrete. When encapsulated within the concrete mix, these bacteria remain dormant until cracks form, at which point they become activated, producing CaCO_3 to fill the gaps and restore the structural integrity of the concrete.

Figure 2: Bacillus Subtilis

Fine Aggregate

Manufactured sand with a fineness modulus of 2.64 was used as fine aggregate. The fine aggregate has a specific gravity of 2.714. (Conforming to IS 383-1970 and IS 2720(Part I - Sec I):1980).

Coarse Aggregate

Coarse aggregate obtained from local quarry units has been used for this study, conforming to IS: 383-1970 [14] is used. The maximum size of aggregate used is 20mm with a specific gravity of 2.707.

Water

The water used for Experiments was potable water conforming as per IS: 456-2000

EXPERIMENTAL PROCEDURE

The M25 grade concrete mix was prepared with Ordinary Portland Cement(OPC-43) and cubes of dimension 150 mm X 150 mm X 150 mm were cast of different Bagasse ash levels (5% to 15% replacement of cement) and Bacillus subtilis of 10, 20 and 30 ml were prepared. The mixes were designated in accordance with IS: 10262-2019. A total of 90 concrete cubes were casted for the different percentages of replacement of cement as well as bacillus subtilis. The specimens were demoulded after 24 hours and curing was done for different age of testing. They were tested for their strength properties as well as healing analysis on 7th ,14th and 28th day.

TABLE 1 DETAILS OF MIX PROPORTIONS OF CONCRETE

SI No	Cement	M-Sand	Coarse Aggregate	Cement Replacement by Bagasse Ash	Bacillus Subtilis
1.	4.86 Kg	7.30 Kg	13 Kg	76g (5%)	10 ml
2.	4.81 Kg	7.30 Kg	13 Kg	159g (10%)	10 ml
3.	4.76 Kg	7.30 Kg	13 Kg	250g (15%)	10 ml
4.	4.86 Kg	7.30 Kg	13 Kg	76g (5%)	20 ml
5.	4.81 Kg	7.30 Kg	13 Kg	159g (10%)	20 ml
6.	4.76 Kg	7.30 Kg	13 Kg	250g (15%)	20 ml
7.	4.86 Kg	7.30 Kg	13 Kg	76g (5%)	30 ml
8.	4.81 Kg	7.30 Kg	13 Kg	159g (10%)	30 ml
9.	4.76 Kg	7.30 Kg	13 Kg	250g (15%)	30 ml

RESULT AND DISSCUSSION

This research compares 9 different Mix Proportion of varying compression strength and Self-Healing Characteristics of each proportion and attain the best of it.

Compressive Strength Results

Table 2 shows the compressive strength of bacteria as well as bagasse ash added cubes. It is observed that M25 grade bacterial concrete is having higher compressive strength than the normal M25 grade concrete. When 20 ml of bacillus subtilis bacteria is added with 5% of Bagasse ash, it gives the compressive strength of 39.22 Mpa, which is the maximum. Hence, we can replace normal M25 concrete by our M25 bacterial concrete thereby it provides both sustainable as well as economical construction.

TABLE 2 AVERAGE COMPRESSION STRENGTH

Bacillus Subtilis	Bagasse Ash (%)	7 Days (MPa)	14 Days (MPa)	28 Days (MPa)
10 ml	5	26.98	27.42	30.32
	10	23.60	30.71	34.25
	15	23.55	28.52	32.11
20 ml	5	18.80	30.91	39.22
	10	23.97	34.67	37.58
	15	24.49	31.22	33.08
30 ml	5	20.24	24.85	30.09
	10	22.94	33.40	37.27
	15	16.72	25.01	29.37

Self-Healing Analysis

Calcium carbonate precipitating microorganisms that is *Bacillus subtilis* is used to heal cracks. After the compression test is done, the following cracked cubes has been kept under two different conditions like wet and dry. The dry (surrounding environmental) condition resulting late growth of the bacterial actions but in the wet condition it is immersed in the water for the 7days, the cracks present in the concrete allow the ingress of water resulting in the chemical reaction with the water. The bacterial cell will be coated with a layer of calcium carbonate, the depth of healed has been figured out by using Vernier Caliper, In which resulting in the microorganism's inactive, but the crack faces bonds together in the meantime. When 10 ml of *Bacillus subtilis* bacteria is added with 5% of Bagasse ash, it gives high healing characteristics towards the cracks better than other proportions.

TABLE 3 HEALING CHARACTERISTICS

Bacillus Subtilis	Bagasse Ash (%)	Crack Depth (mm)	Depth Healed (mm)
10 ml	5	6	3
	10	7	2
	15	5	1
20 ml	5	9	1
	10	6	-
	15	4	-
30 ml	5	5	2
	10	8	1
	15	6	-

The above table shows the depth healed in terms of millimeter where repeated impact/healing scenarios, improved stiffness was in the order of submerged, wet-dry in water, showing that water availability played a crucial role in stiffness gain of the self-healing characteristics.

Figure 3: Identifying the crack depth

CONCLUSION

This research concludes the following based on the experimental investigation that, Compression strength showed an increased value with the bagasse ash is replaced up to 15 % at the end of 28 days.

The result indicates with increase in *Bacillus Subtilis* Quantity Subsequently Decrease in Self-healing characteristic of concrete.

The study on self-healing concrete utilizing Bagasse ash and *Bacillus subtilis* has yielded promising results, demonstrating both high compressive strength and significant healing properties.

By incorporating 10ml of *Bacillus subtilis* and 5-10% of Bagasse ash, the concrete not only achieves remarkable strength but also exhibits impressive self-healing capabilities. These findings suggest a practical and sustainable approach to enhancing the durability and longevity of concrete structures.

The formal results underscore the effectiveness of this innovative solution, offering a potential avenue for future advancements in construction materials.

Abstract

The effect of adding glass powder to concrete to improve the properties of concrete and also the addition of glass powder and fly ash is to minimize the risk of the environmental pollution. The effect of adding glass powder as an admixture on the durability and the thermal insulation. To understand the effectiveness of glass powder and fly ash in strength. In general, first we are going to collect all the materials such as cement, sand, aggregate, glass powder and fly ash. We conduct fineness test, initial test, final setting time test, consistency test for cement impact test. The compressive strength test is spilt one test, compaction factor test and test for the hardened concrete. M30 mix design can be done by this project. We are going to replace the cement up to 10%, 20%. The compressive strength can be compared by normal concrete to fly ash and glass powder mixed concrete in 7, 14, 28 days. Design work are carried out by IS 456-2000, recommended guidelines for concrete mix design. The use of fly ash concrete admixture not only extends technical advantages to the properties of concrete but also contributes to the environmental pollution control. In India the total production of fly ash is more than 100 million tons. The project details can be used to construct with aesthetic appearance of the building without distributing the environment. This project mainly focuses on reduction cost of construction material and it will give high strength when comparing to ordinary concrete.

Keywords

Glass powder, fly ash, fine aggregate, coarse aggregate, water, compressive strength.

INTRODUCTION

In olden days solid wastes were used as landfills in low-lying areas. Industrial wastes like fly ash, silica fume, blast furnace slag etc., And other wastes of plastics, glass, tiles, and agriculture are causing environmental pollution. Glass is an amorphous solid that has been around in various forms for thousands of years and has been manufactured for human use. Glass is one the most versatile substances on Earth, used in many applications and in a wide variety. Glass occurs naturally when rocks high in silicates melt at high temperatures and cool before they can form a crystalline structure there were large amount wastes glasses present in our world so we planned to replace the glass powder instead of cement. This project mainly focuses on reduction cost of construction material and it will give high strength when comparing to ordinary concrete. A glass powder (GLP) is also used as a binder with partial replacement of cement which takes some part of reaction at the time of hydration; also, it is act as a filler material. A denser (less porous) and more homogeneous structure is produced when milled waste glass is used as partial replacement for cement, which benefits the resistance to moisture sorption and thus the long-term durability of cementations materials. Replacement for about 20% of cement, improves the moisture barrier qualities, durability, and mechanical performance of concrete Replacing cement by pozzolanic material like waste glass powder in concrete, not only increases the strength and introduces economy but also enhances the durability The main concerns for the use of crushed glass as aggregate for Portland cement concrete are the experiment and cracking caused by the glass aggregate due to alkali silica reaction.

Literature Review

Engineer Imad Qasim (2009) doing a study on the impact of glass powder on concrete and he was made some tests these tests include compressive strength, flexural strength, and flow table test (workability test). Twenty kilograms of glass powder was used as a partial replacement for cement and sand (silica and limestone) by 0%, 10%, 15%, and 20%. Concrete mixtures were tested at room temperature, four mixtures were cured by water and three mixtures were cured by high pressure steam curing (autoclaving).

Samtur.H.R, 1974, Seung Bum Park and Bong-Chum Lee, (2004): The use of recycled glass as aggregate greatly enhances the aesthetic appeal of the concrete. Recent research findings

have shown that concrete made with recycled glass aggregate have shown better long term strength and better thermal insulation due to its better thermal properties of the glass aggregates (When tested for the Compressive strength values at the 10 %, 40%, and 60 % aggregate replacement by waste glass with 0 – 10mm particle size were 3%, 8% and 5% above the value of Conventional concrete. Better results are achieved when the waste glass powder replaced either 30 % or 70% of the sand with particles sizes ranging between 50 µm and 100µm. Used glass waste, which is cylindrical in shape, prevents crack propagation in concrete structures. From the research carried out on glass powder by the authors, it was found that glass of particle size 1.18 to 2.36 mm produced the highest expansion where as low expansion was observed at smaller particle sizes.

Idir.R, Cyr.M and Tagnit Hamou. A, 2009 it was observed that with a 30% replacement of cement by amber waste glass content of particle size 75µm along with fly ash, the compressive strength of concrete increase 25% at 7 days and 35% when tested for 28 days strength (Pereira de Oliveira. L.A, J.P. Castro – Gomes, P. Santos, 2008). This effect provides ample evidence that both fly ash and waste glass sand can be used together to produce concretes with relative high strength without any adverse reaction. Particle sizes under that threshold had no effect on length variations. Glass was ground to a particle size of 300 or smaller, the alkali reaction (ASR) induced expansion could be reduced.

Scope and Objective

Objective

The objective of the project is to investigate the development of concrete strength using the investigation is also aimed at finding out the optimum grade of concrete for superior strength while using silica fume, fly ash and M sand, foundry sand.

To evaluate the utility of Glass powder & fly ash as a partial replacement of cement in concrete.

The effect of adding Glass Powder to concrete to improve the properties of concrete.

The benefits of addition Glass Powder and fly ash is to minimize the risk of the Environmental Pollution.

The effect of adding Glass Powder as an admixture on the durability and the thermal insulation.

To study and compare the performance of conventional concrete and Glass powder & fly ash concrete.

To understand the effectiveness of glass powder in strength.

Scope

To evaluate the recyclability of glass powder and flash as a pozzolana as partial replacement of cement as partial replacement of fine aggregate in the concrete.

To achieve 28 days characteristic compressive strength

To study the compressive strength of glass powder and flash concrete and conventional concrete.

To carry out the comparative study of compressive strength glass powder and flash and conventional concrete.

To find out optimum grade of concrete at which the concrete yields superior mechanical properties.

To achieve better concrete composite and to encourage the use of glass powder and granite powder to overcome the environmental impact caused due to waste disposal and over depletion of river sand.

Materials

This chapter presents the details of materials for concrete and the mix designs for performing the experimental study. The materials to be used for the experimental study are detailed as follows

Cement

Fine aggregate

Coarse aggregate

Water

Glass powder

Fly ash

Cement

Ordinary Portland cement (OPC) 53 grades in one lot was produced and stored in air tight container. The cement used was fresh, used within three months of manufacture. It should satisfy the requirements of IS10262. The property of cement is determined as per IS4031:1968.

Fine Aggregate

Fine aggregate used in this investigation was medium sand properties of the fine aggregate used in the experimental work. Advantage of natural sand is that the particles are cubical or rounded with smooth surface texture. The grading of natural fine aggregate is not always ideal. It depends on place to place. Being cubical, rounded and smooth textured it gives good workability. Aggregates are the important constituents in concrete. They give body to the concrete, reduce shrinkage and effect economy. One of the most important factors for producing workable concrete is good gradation of aggregates. Good grading implies that a sample fractions of aggregates in required proportion such that the sample contains minimum voids. Samples of the well graded aggregate containing minimum voids require minimum paste to fill up the voids in the aggregates. Minimum paste means less quantity of cement and less water, which are further mean increased economy, lower shrinkage and greater durability.

Coarse Aggregate

Locally available in coarse aggregates having the maximum size of 10 mm and 20 mm were used in the present work. Coarse aggregate is chemically stable material in concrete.

Glass Powder

Glass is a transparent material produced by melting a mixture of materials such as silica, soda ash, and calcium carbonate at high temperature followed by cooling during which solidification occurs without crystallization. Glass is widely used in our lives through manufactured products such as sheet glass, bottles, glassware, and vacuum tubing. The amount of waste glass is gradually increased over the recent years due to an ever-growing use of glass products. Most waste glasses have been dumped into landfill sites. The Land filling of waste glasses is undesirable because they are not biodegradable, which makes them environmentally less friendly. So, we use the waste glass in concrete to become the construction economical as well as eco-friendly.

Figure 1: Glass powder

Fly Ash

Fly ash is the most widely used pozzolanic material all over the world. In the recent time, the importance and use of the fly ash in concrete has grown so much that it has almost become a common ingredient in concrete, particularly for making high strength and high-performance concrete. High volume of fly ash concrete is a subjected of current interest all over the world. The use of fly ash as concrete admixture not only extents technical advantages to the properties of concrete but also contributes to the environmental pollution control. Manufactured sand as a construction raw material neither imposes risks to the human kind nor to the environment. Specific gravity of M-Sand is 2.75 and fineness modulus is 2.74.

Water

The potable water available in college campus was used for mixing and curing of concrete. Water helps in dispersing the cement even, so that every particle of the aggregate is coated with it and brought into ultimate contact with the ingredients. It reacts chemically with cement and brings about setting and hardening of cement. It lubricates the mix and compact properties. The quality of water was found to satisfy the requirement of IS456-2000.

Mix Design

The mix shall be designed to produce the grade of concrete having the required workability and the characteristic strength. The properties are either by volume or by mass. The water-cement ratio is usually expressed in mass.

Factor to be considered

The grade designation giving the characteristic strength requirement of concrete.

The type of cement influences the rate of development of compressive strength of concrete.

Maximum nominal size of aggregates

The cement content is to be limited from shrinkage, cracking and creep.

The workability of concrete and maximum temperature of concrete at the time of placing.

Casting and Curing

The main objective of the test program is to study the strength characteristic of concrete with replacement of Silica Fume and Fly ash. The main parameters were studies the compressive, Split tensile and Flexural strength.

Casting of cubes

Initially the constituent materials were weighed and dry mixing was carried out for Cement, Fine aggregate, Coarse aggregate, Silica Fume and Fly ash, M sand. The was thoroughly mixed manually to get uniform colour of mix. The mixing was carried out for 3-5 minutes duration. Then the mix poured in to the cube moulds of size 150x150x150mm and then compacted manually using taming rods. Cubes are prepared by using the mixes of M30 Grade namely conventional concrete and concrete made by replacing 10%, 20%, 30%, 40%, 50% of Silica Fume, Fly ash, M sand and Foundry sand

Casting of cylinders

Initially the constituent materials were weighed and dry mixing was carried out for Cement, Fine aggregate, Coarse aggregate, Silica Fume, Fly ash, M sand, Foundry sand. This was thoroughly mixed manually to get uniform colour of mix. The mixing was carried out for 3-5 minutes duration. Then the mix poured in to the cylinder mould by layer by layer and each layer effectively compacted by the cylinder of 150mm dia and 300mm height were casted for each design mixes.

Casting of RCC Beams

The concrete mixes were filled in the Beam moulds after laying the reinforcements with the required cover and compacted effectively by using damping rod. The beams dimensions 700x100x100mm were casted for each design mixes.

Curing

The Cubes, Cylinders and Beams are de-moulded after 1 day of casting and then kept in water for curing at normal temperature. The concrete specimens are taken out from curing tank after 7days, 14days and 28days for testing. Curing is a procedure that is adopted to promote the hardening of concrete under condition of humidity and temperature which are conducive to the progressive and proper setting of the constituent cement. They should be sent to the testing laboratory well packed in damp sand, damp sacks, or other suitable material so as to arrive there in a damp condition not less than 24 hours before the time of test Concrete that has been specified, batched, mixed, placed, and finished can still be a failure if improperly or inadequately cured.

Testing of Specimens

The following tests are conducted to the casted concrete specimens.

Compressive Strength Test: The tests were carried out on 150x150x150mm size cube, The compression test is the most common test conducted on the hardened concrete, partly because it is an easy test conducted on the and partly because most of the desirable characteristic properties of concrete are qualitatively related to its compressive strength. The compressive test is carried out on specimens cubical or cylindrical in the shape. The specimen was placed between the steel plates of the compression-testing machine. The load is applied and the failure load in KN is observed from the dial gauge of the Compression Testing Machine. The compression test on cubes was conducted according to Indian

Standard specifications. The compressive strength of the cube specimen is calculated using the following formula:

Compressive Strength, $f_c = P/A$ N/mm².

Split Tensile Strength Test:

A direct measurement of ensuring tensile strength of concrete is difficult. This is an indirect tensile test. The split tensile strength test was carried out on the universal testing machine. The split tensile strength of the cylinder specimen is calculated using the following formula:

Split Tensile Strength, $f_t = 2P/\pi DL$ N/mm² Where, P = Load at failure in N

L = Length of the Specimen in mm

D = Diameter of the Specimen in mm

Flexural Strength Test: Flexural strength, also known as modulus of rupture, bending strength or fracture strength a mechanical parameter for brittle material, is defined as a material's ability to resist deformation under load. The value of modulus of rupture depends on the dimension of the beam and type of loading. The loading is central or third -point loading. In the third -point the critical crack may appear at any section, where the bending moment is maximum or the resistance is weak. The flexural strength represents the highest stress experienced with in material at terms of stress, here given the symbol calculated using the following formula:

The flexural strength when $a > 133$ mm for 100 mm specimen, $f_{fb} = Pa/bD^2$

The flexural strength when $a < 133$ mm for 100 mm specimen, $f_{fb} = 3Pa/bD^2$

b = measured width of specimen in mm

D = measured depth in mm of the specimen at the point of failure.

a = distance of the crack from the nearer support in mm

P = maximum load in N applied to the specimen.

Results and Discussions

Compressive Strength

Compressive strength of concrete is the one of most important property of the hardened concrete. The concrete cubes were casted and tested accordance with the IS standard and 7, 14 and 28 days. Compressive strength results of concrete. The highest compressive strength

value is 39.18 Mpa which is obtained at 28 days for M 30 grade by replacement of 10% ,20% ,30%. Curing periods for the various mixes. The compressive strength is gradually increased when the grade of concrete is increased. Split Tensile Strength

After curing of Cylinder specimen, they are placed in testing machine. The load is applied on the cylinder specimens. The cylinder specimen is failed at ultimate load which is noted from dial gauge reading. From the result.

Split tensile strength is most important property of the hardened concrete. The concrete cylinders were cast, cured and tested accordance with the IS standard and 7 ,14 and 28 days split tensile strength results of concrete. Based on the result, the highest split tensile strength value is 7.0 Mpa (for M 30) which is obtained at 28 days by replacement of 10%, 20%, 30% fly ash and glass powder the split tensile strength of concrete for various mixes. Strength is increased 16.2% than the conventional concrete.

Flexural Strength

After curing of beam specimen, they are placed in testing machine having a maximum capacity of 40 tonne. The load is applied on the beam specimens. The specimen is failed at ultimate load which is noted from dial gauge reading. From the result flexural strength is increased with respect to the grade of concrete when adding 10%, 20%, 30% of fly ash and glass powder when compared to the conventional concrete.

Summary and Conclusions

At the level of 20% replacement of cement by glass powder meets maximum strength as compare to that of normal concrete and other percentage of replacement of cement.

Conventional concrete shows at 28 days compressive strength as 32.27 N/mm² split tensile strength of 3.01N/mm².

- Replacement of glass powder and fly ash in cement by 10%, 20% and 30% increases the compressive strength by 31.70 N/mm², 34.21 N/mm², and 33.03 N/mm², respectively.
- Replacement of glass powder and fly ash in cement by 10%, 20% and 30% increases by 3.48 N/mm², 3.70 N/mm², and 2.82 N/mm² respectively.
- Glass powder concrete increases the compressive and tensile strength effectively, when compared with conventional concrete.

- Very finely ground glass has been shown to be excellent filler and may have sufficient pozzolonic properties to serve as partial cement replacement, the effect of ASR appear to be reduced with finer glass particles, with replacement level.

CARDIOVASCULAR DISEASE DETECTION USING QUANTUM MACHINE LEARNING

Mugundhan.R, Balaji1.T, Vengatesh.C, Elanchezhiyan.E,

Department of CSE, Paavai Engineering College, Pachal, Namakkal-637018

ABSTRACT

This research is the first of its kind to leverage the power of Quantum Machine Learning (QML) to perform multi-class classification of Cardiovascular Diseases (CVDs). We propose a novel approach that enables multi-class classification with Pegasos Quantum Support Vector Classifier (QSVC). The QSVC and the Pegasos QSVC significantly outperform the classical SVC by a margin of +10.76% and +9.72%, respectively. The paper further ventures into a quantum deep learning based architecture with a novel Quantvolutional Neural Network (QNN) implementation, outperforming not only its classical CNN counterpart by +3.88% but also the other models by achieving 97.31% accuracy, 97.41% precision, 97.31% recall, 97.30% F1 score, and 99.10% specificity.

INTRODUCTION

Cardiovascular diseases (CVDs), one of the largest causes and concerns of mortality and disability in the world [1], refers to a group of illnesses that affect the heart muscles. In 2020, approximately 19 million deaths were found to be caused by CVD globally.

Early detection of CVDs has been done by utilizing advances in the field of biotechnology. Major developments in the biosensors domain, such as the advent of lab-on-a-chip technology, have demonstrated the ability to detect cardiac markers [2]. Advances in microfluidics technology have helped reduce application time and integrate multiple clinical assays into a single device [3]. Protein chip development has also significantly contributed to early CVD detection [4]. The past two decades have witnessed a remarkable advent of Artificial Intelligence (AI), Natural Language Processing (NLP), Computer Vision (CV), and other areas and domains such as healthcare, and cybersecurity. Machine learning algorithms have achieved unprecedented accomplishments due to the availability of vast data

aggregates. AI research for CVDs can be broadly summarised into Machine Learning (ML), Deep Learning (DL), unsupervised learning, Artificial Neural Networks (ANNs), and Convolutional Neural Networks (CNNs) [5].

The high cost of computation is the primary disadvantage of AI techniques [7]. The advantage of Quantum Computing (QC) methods, on the other hand, is that they can accelerate computation by applying the principles of quantum mechanics. Quantum computers are structured on probabilistic results dependent on intrinsically coupled quantum systems [8]. This results in a massive increase in parallel computations due to the superposition of quantum states. Thus, by procedural utilization of fundamental quantum effects such as superposition, interference, and quantum entanglement, quantum algorithms can efficiently circumvent the drawbacks faced in classical AI techniques [9]. Differences between classical ML and QML have been reviewed in [10]. QC has been explored in solving complex sampling tasks that require expensive computations on classical computing systems to establish quantum supremacy in the near-term [11]. Various QC approaches have been employed in the domains of healthcare [10], financial risk analysis [11], portfolio management and optimization [12], and trading algorithms development [13] to solve real-world problems. The Noisy Intermediate-Scale Quantum (NISQ) period, the current QC era, explains the present state of QC technology. Quantum computers are becoming increasingly powerful and effective. However, they are still susceptible to errors such as noise, hardware shortcomings, and decoherence [14]. Nonetheless, significant advancements in the field prospects do look promising.

PRELIMINARIES AND NOTATIONS

This section aims to introduce some mathematical notations useful in quantum computing. The Ket notation $|\psi\rangle$ represents an object as a column vector. The complex conjugate of a ket is called the bra. Hence it is collectively termed the “Braket” notation. A single qubit represents a two-level quantum system in a two-dimensional Hilbert space C^2 with orthonormal bases. It can be described using the superposition principle:

$$|\psi\rangle = \alpha|0\rangle + \beta|1\rangle$$

Here, $|\psi\rangle$ is a linear combination of the quantum states of two basis states $|0\rangle$ and $|1\rangle$ that expresses the quantum state of a qubit, α and β are complex coefficients that represent

the probability amplitudes of the two states, respectively. Table 1 summarizes the common quantum operations performed on qubits.

MOTIVATION AND CONTRIBUTIONS

The Quantum Machine Learning (QML) models presented in this paper use supervised multiclass classification and are employed to detect various CVDs using Electrocardiogram (ECG) images. Hyperparameters of the models used are tuned to get the most optimal results, and the final results procured from each model are described. The motivation behind our work follows along with the advent of machine learning coupled with quantum computing to explore the growing field of QML and establish better results in the field of medical image classification. Owing to resource constraints in image processing, the progression in performance, albeit notable, isn't fully optimal yet. Our research aims to benchmark QML models for CVD classification using ECG images, which, to the best of our knowledge, has not been done thus far. We aim to explore Support Vector Classifier (SVC) based and DL-based techniques to improve the performance measured against the classical counterpart. We also intend to facilitate multi-class classification with Pegasos Quantum SVC (QSVC) using a mathematical combination of its binary classification models. The main contributions of our study can be summarized in the following points.

1. Cardiovascular disease classification problem on ECG images has been explored using three Quantum Machine Learning models.

2. The QSVC model has significantly outperformed its classical counterpart, the SVC model, by +10.76% accuracy, +9.73% precision, +10.76% recall, +10.79% F1 score, and +3.73% specificity.

3. The Pegasos QSVC, a quantum-enhanced SVM algorithm, presently supports binary classification. A novel workflow has been established to extend its binary classification abilities to perform multiclass classification for four classes.

4. A new architecture for the implementation of Quantum Convolutional Neural Network (QNN) is proposed. The remaining sections in the paper have been described here. Section II provides a literature review on QML approaches on medical image classification and QML approaches on cardiac datasets. Section III focuses on the experiment, describing the experimental setup and the dataset used. Furthermore, pre-processing done on the dataset

is described here. Subsequently, Section IV explains the three models implemented and the architecture used. Section V focuses on results and discussion of the proposed models. Section VI comprises the conclusion and future scope.

EXPERIMENTAL SETUP

On a computer having the following specifications: x86- 64 architecture with 4 CPU cores and 2 threads per core, featuring an Intel(R) Xeon(R) CPU @ 2.20GHz and equipped with 30GB of RAM, the experiments were carried out.

ECG IMAGES DATASET OF CARDIAC PATIENTS

For this research, 928 ECG images of cardiac patients from a dataset by the Ch. Pervaiz Elahi Institute of Cardiology in Multan, Pakistan [34] was considered. The dataset under consideration consists of four classes, namely, Normal Person (NP), Abnormal Heartbeat (AH), Myocardial Infarction (MI), and History of Myocardial Infarction (H. MI). The data split is 284, 233, 240, and 172 images, respectively. The class represented as NP illustrates people having no cardiac abnormalities. AH class refers to patients suffering from Cardiac Arrhythmia. This indicates a deviation from the regular heartbeat's rhythm or pace [35]. The condition arises when the electrical impulses controlling the heartbeats are coordinated improperly. This results in the heart beating quickly (tachycardia), too slowly (bradycardia), or irregularly. The MI, also known as a heart attack [36], is a medical emergency that occurs when blood supply to a portion of the heart muscle is cut off, typically due to an accumulation of fatty deposits in the coronary arteries. The chest discomfort, loss of breath, and other symptoms may result from this, harming or killing the heart muscle. If not treated quickly and efficiently, this can result in significant consequences such as heart failure, arrhythmia, and sudden cardiac death. The H. MI refers to individuals who have just experienced recovery from a myocardial infarction. In the proposed approaches to the classification task, the dataset has been split into train and test sets in the ratio of 80:20. The Fig. 1 represents sample images from each class of the dataset

DATA PREPROCESSING

The edges of all the images in the dataset are cropped out to retain only the portion occupied by the region of interest, specifically the ECG graph. The background removal was

performed by thresholding pixel values resulting in a binary image. The ECG wave readings in the foreground were represented in black, and the background in white. Vertical lines, common to all images indicating the separation between the lead readings, were also removed. These pre-processed images are further used for all the experiments. Fig. 2 showcases an ECG image from class NP after the preprocessing stages.

METHODOLOGY

QUANTUM SUPPORT VECTOR CLASSIFIER (QSVC)

A QSVC [37] is the quantum equivalent of the classical SVC [38] or SVM. The SVC is a supervised machine learning model that solves classification problems and requires high computational resources due to operations in a high dimensional space. It functions by identifying a line or a hyperplane to separate two groups or classes and applies one vs. one or one vs. rest methods to handle multi-class classification tasks. The classical SVC applies kernels, which are complex mappings that add new dimensions to the data, hence constructing higher-dimensional feature spaces. These mappings ease boundary identification, thus separating the classes. On the other hand, the QSVC employs a quantum kernel to capture more complex similarities between data points that cannot be efficiently computed with normal kernels. Additionally, it can reduce the number of classical computations required for SVC, leading to faster and more efficient classification.

FEATURE EXTRACTION

Pre-trained DNNs support transfer learning and facilitate efficient feature extraction from images. These neural networks have been trained on massive datasets comprising of more than a million images belonging to hundreds of classes. In the proposed implementation, the images have been resized to 340×340 to handle computational capacity limitations and speed up processing. A ResNet50 model [39] has been employed to the dataset in order to extract the features. The model weights have been initialized with pre-trained weights on the Imagenet dataset [40]. The image features are extracted from the pool1_pool layer. This layer is a max-pooling layer that takes the maximum of a set of values within a kernel window and outputs it as the new value for the corresponding location. This is a shallow-level layer containing more low-level features. The extracted features of all images are

flattened into a one dimensional feature vector and subsequently stacked together to form a feature matrix. Dimensionality of the obtained feature matrix is reduced using Truncated Singular Value Decomposition (SVD) [41].

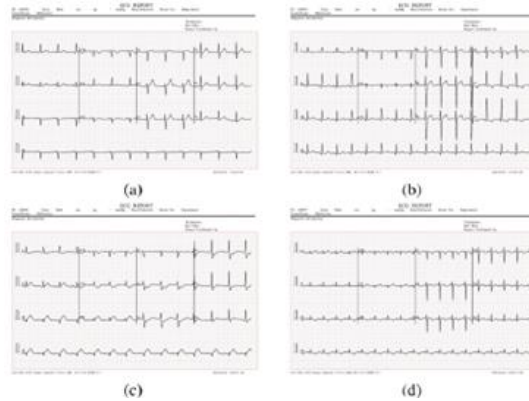

Figure 1. Sample images from the dataset (a) NP (b) AH (c) MI (d) H. MI.

This technique is applied such that it yields the top 9 most relevant features from the images. Furthermore, the feature matrix is scaled to a range of 0 to 1, thus enforcing uniformity.

ALGORITHM

The QSVC algorithm as outlined in Fig. 3 can be summarized into four significant steps: 1) Encoding of data: The input classical data x^{\rightarrow} in quantum states is encoded using a quantum feature map $\phi(x^{\rightarrow})$. In a complex Hilbert space, the encoded data can be represented by a unit vector. 2) Quantum Kernel Computation: A quantum circuit is used to compute a mathematical function known as a quantum kernel that assesses the similarity or inner product between two encoded data points in the feature space. 3) Quantum Optimization: To determine the hyperplane's ideal weights, an optimization procedure is used. 4) Measurement and Interpretation: Measurement of the output of the quantum state and interpretation of the final decision plane is carried out.

The optimization problem in QSVC is identical to that of a classical SVC, but it utilizes a quantum kernel. The expression representing the general SVC optimization problem is given by (1).

$$\min w, b \quad ||w||^2 \text{ such that } y_i (w x_i + b) \geq 1, i = 1, \dots, N \quad (1)$$

where x_i is a data point and y_i is the corresponding label 1 or -1. w and b denote the weights and biases used respectively. To allow for some data points to be misclassified or to

account a weight C that controls the trade-off between maximisation of the margin and minimization of the classification error for each training instance as shown in (2).

Figure 2. A general pipeline for QSVC.

MULTICLASS PEGASOS QUANTUM SUPPORT VECTOR CLASSIFIER

Primarily derived from [44], the Pegasos algorithm is an effective and scalable technique for solving the quadratic SVM problem. The Pegasos algorithm fundamentally employs a sub-gradient descent method for optimization. The objective of the algorithm is to identify a hyperplane that separates the two classes under consideration until the cost function described in Eq. (1) is minimized. The hybrid quantum model evolved from the above for classification tasks is known as the Pegasos QSVC. The Pegasos algorithm is initialized with a solution that is iteratively improved by moving in the opposite direction of the objective function's negative gradient. Each iteration is responsible for the updation of the weight vector w and the bias b on a mini-batch of data. To ensure convergence to the ideal value, the approach uses a step size that is inversely proportional to the number of repetitions. The technique then uses the kernel approach to solve the quadratic optimization problem to determine the best boundary in this higher dimensional space [45]. The Pegasos QSVC implements the kernel equation represented in (5), and runs in a time complexity independent of the training set size. The scope of the Pegasos QSVC is currently limited to binary classification tasks. Work has been done to incorporate multiclass classification on SVMs by using combinations of binary classification algorithms. In [46], the authors employ an Adaptive Binary Tree (ABT). The proposed solution concentrates on locally choosing the minimal number of Support Vectors (SVs) per classification. The authors in [47] propose an implementation by limiting the number of hyperplanes used in the standard one-against-one technique. The proposed implementation applies combinatoric mathematics. The number of combinations possible for four classes taken two at a time is six. Feature extraction is carried out as mentioned in Section IV-A1.

Figure 4. Pipeline followed for Multiclass Pegasos QSVC.

Figure 5. Circuit employed for the quantum layer of QNN

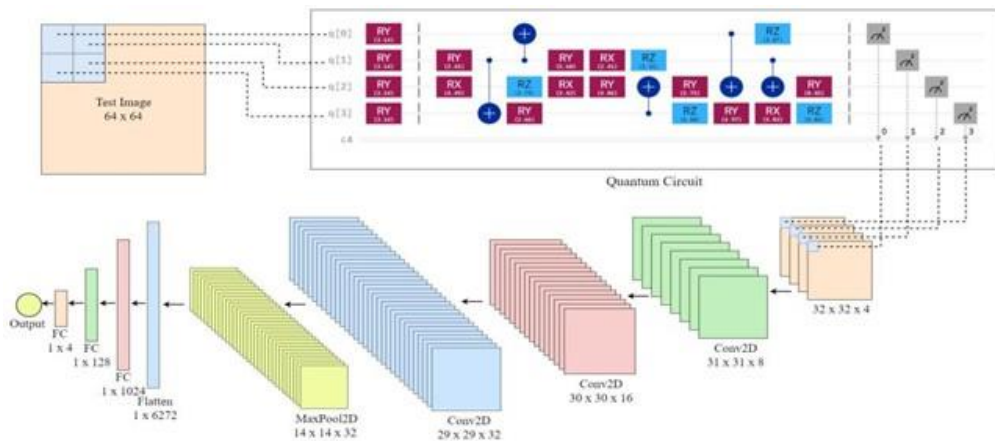

Figure 6. Proposed QNN architecture.

QUANVOLUTIONAL NEURAL NETWORK

(QNN) The motivation to integrate CNNs [48] with quantum layers arises from an effort to enhance the capabilities of these networks. CNNs are able to process and classify visual data owing to their ability to extract hierarchical features. Introducing quantum layers [49], is an innovative step in enhancing a CNN as it represents a new kind of transformational layer that integrates quantum computing in the traditional architecture. Thus the network can perform local transformations on the data using quantum circuits. These quantum circuits offer new avenues for feature extraction. The work in [49] described the Quanvolutional model's ability to leverage random nonlinear features, modify training time, and model complex relationships using computational resources at polynomial time complexity. This combination makes the Quanvolutional model an excellent choice to consider for image classification problems.

1) DESIGN OF QUANTUM FILTER In the quanvolutional approach, the input data is transformed using quantum circuits instead of the classical matrix operations. The specific quantum circuit, as depicted in Fig. 6, is composed of a series of quantum gates, including R_x , R_y , R_z (which are rotation gates acting on different axes of the Bloch sphere), CNOT, and Pauli-Z measurement gates. The quantum gates employed, their notation, and operations are expanded upon in Table 1.

IMPLEMENTATION

Images were resized to dimensions of 64×64 pixels. Subsequently, the images were divided into square subregions of dimension 2×2 , which were passed to the quantum circuit iteratively. Quantum operations are performed on the input according to the circuit. Four values are returned which are then stacked as individual pixels on different channels, thereby transforming the input to a dimension of $32 \times 32 \times 4$. The proposed QNN architecture is shown in Fig.7. After applying the quantum convolutional layer, the resulting features are then fed into the proposed CNN architecture. The proposed 8-layered CNN architecture comprises of three 2D convolutional layers employed with the ReLU activation function, a max pooling layer, a flatten layer, and 3 fully connected layers. The first convolutional layer contains 8 filters which are doubled across each of the next two layers. The filter size chosen is 2×2 , with a stride of 1.

Figure 7. Experimental results for number of features VS accuracy for QSVC.

Figure 8. Experimental results for number of random layers vs K-fold accuracy for QNN.

Subsequently, a max pooling layer is employed with a pool size of 2×2 . The features are flattened and further passed to three fully connected layers. The 1024 nodes make up the first completely connected layer, which is followed by a layer of 128 nodes. The final layer comprises of 4 nodes with softmax activation function, thus making it suitable for multi-class classification of four classes.

RESULTS AND DISCUSSION

Model performances have been evaluated using the metrics listed in Table 3. Proceeding to the QNN, the number of layers for the quantum circuit was chosen to be four after comparing results with other values.

HYPERPARAMETER TUNING

Appropriate tuning of hyperparameters can lead to significant enhancement in the model performance. The number of features fed into the QSVC model, also corresponding to the number of qubits used by the model, is a critical point of discussion. The corresponding

accuracies obtained by varying it within a range of 2 to 18 are depicted in Fig. 8. The graph followed an increasing trend till $n = 7$, post which minor variations are observed until $n = 13$. Subsequently, the graph stabilized to a constant value. The maximum accuracy of 94.09% is observed at $n = 9$, hence the optimal choice for the model.

To maintain uniformity, the Pegasos QSVC models' feature input was set at 9 features. The regularization parameter (C) and number of repetitions (τ) were tuned for each of the 6 binary models.

COMPARATIVE ANALYSIS AND DISCUSSION

We highlight significant results from the experiments in this section. The SVC plays a crucial role in machine learning research owing to its high accuracy in classification tasks, flexibility, robustness, interpretability, and efficiency. These characteristics enable it to function as a good baseline algorithm in machine learning research, where the goal is to develop techniques that can outperform it. The performance measures of SVC.

CONCLUSION AND FUTURE SCOPE

In this work, we have successfully presented the application of QML for the multi-class classification of CVDs using ECG images. The paper demonstrated the potential of QML models to outperform classical models. The work proved the ability to perform multi-class classification by illustrating the same with the application of combinatoric mathematics on the Pegasos QSVC model. The proposed QNN implementation presented in this study performed exceptionally well. Post the NISQ era, quantum algorithms are bound to be significantly more powerful. Thus, future prospects in the field are promising. Advancement in this field could comprise of integrating QML models with quantum hardware and incorporating the same within existing medical systems can help improve diagnostics. The development of QML models can aid in the early detection and prediction of more medical ailments and thus help save lives.

ABSTRACT

The progressive neurological condition known as Cognitive Impairment presents a major obstacle to international healthcare systems. For successful management and intervention, early identification is essential. This article describes the creation of a neural network model for predicting Alzheimer's, covering all the important phases from data collection to model deployment. By dividing the data into training and testing sets, it becomes easier to evaluate the models. Selecting a suitable method, such as a neural network, Random Forest, Support Vector Machines, or Logistic Regression, is the first step in the model selection process. Performance is optimized through model training and fine-tuning, with evaluation guided by parameters such as accuracy, precision and recall.

KEYWORDS

MCI, MAD, MRI

INTRODUCTION

The process of collecting data entails assembling a diverse dataset that includes findings from cognitive tests, genetic markers, neuroimaging, and demographic data. Subsequent data pre-processing, missing value correction, and feature normalization are done to ensure data quality. The most informative variables are identified through feature selection, which improves the interpretability and efficiency of the model. The selection of models that enable insights into decision-making processes – crucial in healthcare applications – emphasizes interpretability.

Integration with healthcare systems and addressing privacy and ethical issues are deployment considerations. Ensuring the model's relevance and flexibility to changing datasets requires constant monitoring and modification.

PHASES OF COGNITIVE IMPAIRMENT

Cognitive Impairment develops in phases, with various symptoms and cognitive impairments associated with each stage. The stages generally follow a predictable pattern, though the precise progression may differ among individuals. The following stages of Cognitive Impairment are widely acknowledged:

Preclinical Stage: People in this stage of development don't exhibit any symptoms, yet there are underlying brain changes going on. Cognitive Impairment may be detected by biomarkers, such as alterations in cerebrospinal fluid or brain imaging. Research investigations are frequently used to identify this stage rather than through clinical observations.

Mild Cognitive Impairment: People in this stage may have mild cognitive impairment, which is more than one would anticipate given their age but not severe enough to cause major problems in day-to-day functioning. One may notice memory lapses, especially regarding recent events. Cognitive Impairment does not typically progress from mild cognitive impairment (MCI); some individuals with MCI may improve.

Cognitive Impairment in its Early Stages: This stage is characterized by a slight decline in cognitive function that begins to interfere with daily activities. Symptoms include memory loss, difficulty pronouncing words correctly, trouble understanding problems, and occasional mood swings. Individuals may still be able to perform routine tasks on their own, but more complex tasks may require assistance. Risk of infections and other health problems. Individuals in this stage require full-time assistance with all aspects of daily living, including eating, dressing, and personal hygiene. They may also experience changes in personality and behavior, such as

agitation, aggression, and hallucinations. It is a challenging stage for both the individual and their caregivers.

Stage of End of Life: During this phase, people usually experience a significant decline in their physical and mental capacities and are often bedridden. People may develop aspiration pneumonia as a result of losing their ability to swallow. The end-of-life phase lasts for varying lengths of time, and comfort and dignity are given priority in treatment. It's important to keep in mind that not everyone deteriorates through these stages at the same rate; some people may degrade more quickly than others. Furthermore, fresh research in the area may help us better understand the stages of Alzheimer's. Early diagnosis, sufficient support, and care can enhance the quality of life for those with Alzheimer's and their families during these stages.

FACTORS THAT INCREASE THE CHANCE OF COGNITIVE IMPAIRMENT

The precise origins of cognitive impairment, a complicated neurological condition, are not entirely known. Nonetheless, evidence indicates that a mix of behavioural, environmental, and hereditary factors may play a role in the onset of cognitive impairment. The following are some of the main reasons and risk factors for Alzheimer's disease:

Genetic Elements Family Background: People who have a family history of cognitive impairment are more vulnerable. Apolipoprotein E (APOE) gene is one of the genes that has been identified as a risk factor. Alzheimer's disease risk is raised in people with APOE4.

Age: As people age, they are more likely to experience cognitive impairment. Although Alzheimer's is not a typical aspect of aging, the illness is much more common.

Gender:

The risk of developing Cognitive Impairment is higher for women compared to men. This increased risk may be partly attributed to the longer life expectancy of women.

Lifestyle Factors:

Hypertension, diabetes, and high cholesterol are cardiovascular health conditions that can affect the heart and blood vessels and increase the risk of cognitive impairment.

Physical Inactivity: Lack of regular physical exercise is associated with a higher risk of cognitive decline and Cognitive Impairment.

Diet: Poor dietary habits, especially diets high in saturated fats and low in antioxidants (found in fruits and vegetables), may contribute to the risk.

Environmental Factors:

Head Injuries: Traumatic brain injuries, especially repeated concussions, have been linked to an increased risk of developing Cognitive Impairment.

Exposure to Certain Toxins: Prolonged exposure to certain environmental toxins or pollutants may contribute to cognitive decline.

Education and Cognitive Engagement: According to research, having more education and participating in cognitively demanding activities throughout life may guard against cognitive impairment.

Down syndrome: Individuals with this condition are more likely to experience cognitive impairment, and their symptoms frequently start earlier in life.

Social and Cognitive Engagement: Maintaining a busy social schedule and taking part in mentally demanding activities may help preserve cognitive abilities.

Sleep Disorders: A higher risk of cognitive decline may be linked to conditions like sleep apnea and disruptions in sleep patterns.

Fig.1: Alzheimer Disease / Cognitive Impairment

MANAGING THE CHALLENGES OF COGNITIVE IMPAIRMENT

There are various difficulties in identifying and analyzing cognitive impairment.

Cognitive impairment is confronted with the following challenges:

- I. Lack of understanding and awareness of the illness.
- II. Issues with identifying and diagnosing the illness.
- III. Insufficient medical care and technology.
- IV. Inaccurate prediction at various stages.
- V. Analysis and prediction require more than just stage-wise prediction.
- VI. New technology that has not been adapted for analysis and prediction.
- VII. The primary focus of this study was on the challenges III-VI related to cognitive impairment prediction and stage-by-stage analysis.

STRATEGIES FOR ASSESSING COGNITIVE IMPAIRMENT

Predicting Cognitive Impairment involves employing various techniques, especially from the field of machine learning. These techniques leverage diverse data sources, including demographic information, genetic data, cognitive test results, and neuroimaging data, to identify patterns indicative of the disease. Here are some common techniques used for Prediction of Cognitive Impairment:

Logistic Regression: An algorithm that models the likelihood of an instance falling into a specific class (in this case, Alzheimer's or non-Alzheimer's) is straightforward and easy to understand. **Application** - It can shed light on the relative relevance of various features and is appropriate for binary classification tasks.

SVMs, or support vector machines:

Essentially, SVMs look for the hyperplane that divides data points into the most distinct groups. They perform admirably for both linear and non-linear classification. **Application** - SVMs are useful for predicting Alzheimer's disease with complex feature sets since they are good at handling high-dimensional data.

Random Forest: Described as an ensemble learning technique, Random Forest builds several decision trees and combines their predictions. It offers a measure of

feature importance, is resilient, and manages non-linearity effectively. Application - Capable of capturing intricate correlations in the data, it is useful for handling a combination of numerical and categorical information.

Artificial Intelligence: Deep learning architectures, in particular, which are a type of neural network, have the ability to recognize complex patterns in large, complicated datasets. Neuroimaging data is processed using Convolutional Neural Networks (CNNs). Use - Neural networks are good at capturing non-linear relationships and can process massive volumes of data. When working with high-dimensional data, such as neuroimaging scans, they are especially helpful.

Decision Trees: Decision Trees generate a structure similar to a tree by repeatedly dividing the data according to attributes. They can be helpful in comprehending the decision-making process and are simple to interpret. Use - Decision trees can be included in ensemble techniques such as Random Forests and are useful in feature selection.

KNN, or K-Nearest Neighbors: Description: KNN uses the class labels of its closest neighbors to classify a given data item. For classification tasks, this approach is both straightforward and efficient. Application- KNN can be sensitive to the distance measure selected and is helpful for small to medium-sized datasets.

Group Approaches: The goal of ensemble methods is to increase overall forecasting performance by combining numerous independent models. One illustration of an ensemble approach is Random Forest. Application-By minimizing overfitting, ensemble approaches can improve the robustness and generalization of models.

Techniques for Reducing Dimensionality: High-dimensional datasets can be made less dimensional by using methods like Principal Component Analysis (PCA) or t-Distributed Stochastic Neighbor Embedding (t-SNE). Application- Identifying important traits and increasing computational performance are two benefits of reducing dimensionality.

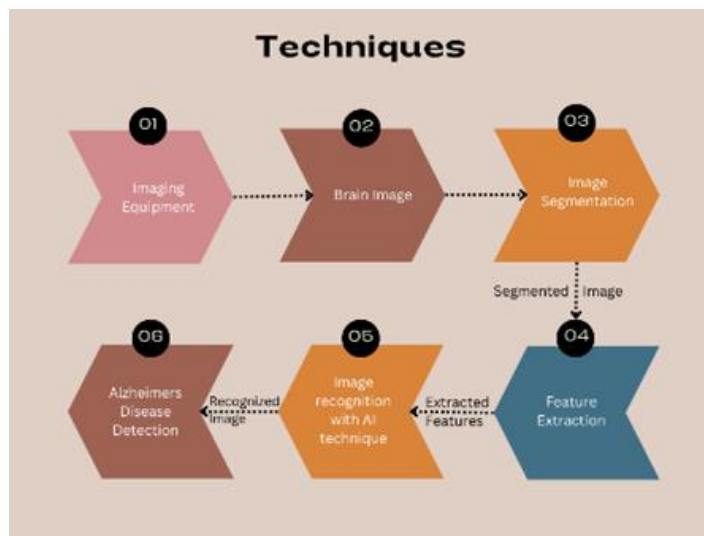

Fig.2: Techniques of Cognitive Impairment Prediction

PREREQUISITES FOR COGNITIVE IMPAIRMENT PREDICTION

To predict cognitive impairment, the collection of brain images and the models used to analyse those images are crucial. Generally, there are two categories for image processing models: process modeling and visualizations. In addition to the model, a collection of image collection strategies and feature selection approaches are crucial prerequisites for predicting cognitive impairment. The following are the primary prerequisites:

- I. MRI, or magnetic resonance imaging
- II. PET, or Positron Emission Tomography
- III. Features of MRI biomarkers

MRI using T1- and T2-Weighted Images

Two popular magnetic resonance imaging (MRI) sequences used in medical imaging, particularly neuroimaging, are T1-weighted (T1W) and T2-weighted (T2W). These sequences offer various contrasts and are useful for illustrating various tissue properties. An overview of T1- and T2-weighted MRI is provided here.

MRI USING T1 WEIGHTING

Contrast Mechanism: T1 relaxation time: Variations in tissue T1 relaxation times are highlighted by T1-weighted imaging. T1 is the amount of time that passes after an external radiofrequency pulse disrupts the longitudinal magnetization before it returns to 63% of its initial value.

Features of the Image:

Anatomy: T1-weighted images are frequently utilized for structural imaging because they provide great anatomical information.

Water vs. Fat: Water appears dark (hypointense), whereas fat appears bright (hyperintense).

Contrast Agents: T1-weighted images are helpful for vascular structure imaging and lesion enhancement because they are very good at identifying contrast agents.

Usage in Clinical Settings:

Imaging of the Anatomy: For precise anatomical imaging of tissues like the brain, muscles, and joints, T1-weighted images are frequently utilized.

Post-contrast imaging: T1-weighted post-contrast imaging is essential for identifying abnormalities by enhancing the visualization of enhanced structures.

Common Applications:

Brain imaging includes post-contrast imaging for lesion detection and visualization of the anatomy of the brain. Musculoskeletal imaging is used for the evaluation of muscles, ligaments, and joints. Abdominal imaging is used for the evaluation of the kidneys, liver, and other abdominal tissues.

T2-Weighted MRI:

Mechanism of Contrast: T2 relaxation time-Variations in the T2 relaxation time of different tissues are highlighted by T2-weighted imaging. The transverse magnetization decays to 37% of its initial value in T2, or the time it takes.

Features of the Image: Anatomy-Because T2-weighted images have good contrast in soft tissues, they can be used to diagnose anomalies and diseases.

Soft Tissue vs. Fluid: Soft tissues appear comparatively dark (hypointense), while fluid-filled structures appear bright (hyperintense).

Usage in Clinical Settings: Pathological Diagnosis: T2-weighted images are particularly sensitive to anomalies including edema, inflammation, and lesions. Brain and spinal cord CSF gaps can be seen with the use of cerebrospinal fluid (CSF).

Soft Tissue Assessment: T2-weighted images are suitable for assessing soft tissue components such as tendons and muscles.

Common Applications: The process of finding anomalies, edema, and lesions in the brain and spinal cord is known as neuroimaging. Musculoskeletal Imaging – involves the evaluation of muscle anomalies, ligament damage, and joint effusions. The evaluation of the digestive system and lesion diagnosis is done using abdominal imaging.

Combination Use: Imaging in Multiple Sequences: To offer a thorough assessment of the anatomy and pathology, T1-weighted and T2-weighted sequences, together with additional sequences, are frequently obtained in a single imaging session.

Clinical Diagnosis: After jointly interpreting these images, radiologists and clinicians diagnose conditions and develop the best course of action. In summary, T1-weighted and T2-weighted magnetic resonance imaging sequences are essential for clinical imaging. They offer complementary insights into tissue properties and facilitate the diagnosis and treatment of a range of medical ailments. The clinical question and the particular data required for a diagnosis determine which order is best.

IMAGING USING PET-MR

Technical difficulties emerging from both modalities when they are paired have slowed the development of combined PET and MR imaging, despite the fact that combined PET-CT scanners were swiftly established as clinical instruments. The potential benefit of combining PET and MR imaging is ascribed to the various imaging modalities that can be used, as well as the improved soft-tissue imaging

capabilities of MR over CT. Furthermore, PET-MR imaging can provide genuinely simultaneous imaging, which is not possible with PET-CT imaging. Its integrated inline design makes this possible.

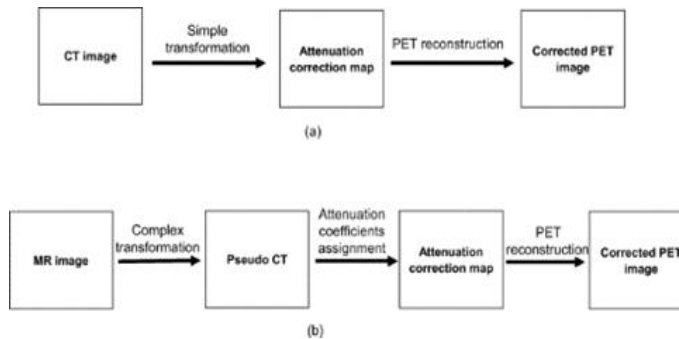

Fig.3 Imaging using PET-MR

Execution

Pre-processing of the information includes all the operations required to handle the input dataset. To avoid the curse of dimensionality, the data is first partitioned into train and test data files, and then pre-processing is done, such as normalization. Some exploratory data analysis is carried out, including the distribution of answer variables and quality checks for null or missing values, among other things.

Feature-extraction: In this stage, we use the feature extraction and selection techniques from the sci-kit learn Python libraries. We utilize simple bag-of-words and n-grams for feature selection, followed by term frequency weighting such as TF-IDF (term frequency-inverse document frequency).

Fig. 4: Identification of cognitive impairment

Classification: Various classifiers are fed the retrieved features. We have employed Random Forest, KNN (K-Nearest Neighbour), Naive-Bayes, and SVM (Support Vector Machine) classifiers from sklearn. Every retrieved feature was

incorporated into every classifier. The necessary conditions for Alzheimer's prediction models were emphasized. These conditions included a variety of datasets, ethical considerations, and cooperation with medical professionals. To successfully create and implement efficient predictive models, these requirements must be integrated. It becomes clear that a comprehensive strategy is required as we examine the complexity of cognitive impairment. Collaboration between data scientists, healthcare practitioners, and domain specialists is crucial, even in the absence of technical improvements. Enhancing early identification, understanding, and management requires us to be guided by ethical issues, privacy, and regulatory compliance.

CONCLUSION

Consequently, the discussion of cognitive impairment has provided an extensive overview of the different aspects of this neurodegenerative disease. We have examined the risk variables and contributing factors, emphasizing the complex interplay among genetic, environmental, and lifestyle factors. Understanding the stages of cognitive impairment is crucial for early detection and treatment, improving the quality of life for affected individuals. The discussion of machine learning models for Alzheimer's prediction highlighted the possibilities of state-of-the-art technologies in early diagnosis. To build such models, thorough data collection, pre-processing, and model selection are needed, with an emphasis on moral dilemmas, interpretability, and continuous observation. In the final analysis, the seminar on cognitive impairment is an initial step toward a collaborative effort to tackle this challenging problem. The conversation about technological developments, ongoing research, and interdisciplinary cooperation is crucial to the greater endeavour to improve the lives of Alzheimer's patients and their families.

ABSTRACT

Integrating blockchain technology with a regeneration coding storage architecture is the novel way to data security that this research investigates as a means to improve edge computing settings. The varied and sometimes underpowered nature of devices in the network's periphery makes data security a particular headache for decentralized and distributed computing models like edge computing. The suggested solution uses Blockchain's immutability and decentralization to safeguard data records. It employs a regeneration coding storage architecture to optimize storage throughout the distributed edge network and assure fault tolerance. Data is partitioned and stored among edge devices as part of the integration process; redundant parts are added to recover data in the event of corruption or loss. Using smart contracts to enforce access control and an immutable and transparent record of data exchanges, blockchain technology ensures that records cannot be tampered with. The overarching goal of this combined strategy is to build a safe and secure environment that can withstand assaults on its storage infrastructure and data integrity. The article highlights the advantages of decentralized storage, fault tolerance, and enhanced security, but it also recognizes the difficulties, such as scalability requirements and resource limitations on edge devices. The optimization of these integrated technologies' performance and the establishment of standards for their smooth application in edge computing settings are future issues. This paper adds to the growing body of research on safe edge

computing architectures, providing a potential solution to the problem of data security in distributed and under-resourced environments.

INTRODUCTION

Thanks to developments in areas like the Internet of Things (IoT), Big Data analytics, cloud computing, machine learning, and artificial intelligence, new Smart computing systems may be built in smart settings to make people's lives easier. The smart city, healthcare, entertainment, and social media all benefit from innovative computing, as do transportation, energy, environmental protection, and the Internet of Things. In smart computing, more and more apps are transferring massive volumes of data into cloud servers for computing or storage [1] [2]. It can address the issue of limited storage space and inadequate computation performance of intelligent terminals and other devices [3]. In addition, customers in a cloud computing environment do not need to worry about technical difficulties like growth and fault tolerance since such tasks are handled automatically by the service provider [4] [5]. Cloud storage is a utility like water, electricity, or gas; users only pay for what they use from CSPs. The proliferation of IoT-enabled endpoints like smartphones and intelligent eyewear is outpacing the expansion of networks' capacity to store and process this data. At the same time, a growing need for delay is being proposed by numerous cutting-edge applications like augmented reality and driverless cars. The Cisco cloud index (GCI) predicts that by 2020, worldwide data center traffic will reach 15.3 ZB. It has been expected that there will be 50 billion IoT devices in use by 2020 the Internet Business Solutions Group (IBSG) [6]. "The conventional cloud computing paradigm cannot match the application requirement of the Internet of Things because the link between traditional items limits it. [7]"

LITERATURE REVIEW

The authors encountered problems with the high bandwidth and low latency needs of the proliferation of Internet of Things (IoT) devices in the cloud. This led to the need for decentral- ized computing, which eventually became edge computing. Additionally, many security threat pathways are shown by edge computing. Problems can emerge when the primary server is down for a long time [8]. Because of this, it is wise to use Blockchain's consensus method, which is best understood as a decentralized network of interconnected blocks. This proves that transferring DL, RL, and other ML models to the Internet of Things and the edge is no easy feat. One of the most crucial topics for research enthusiasts, this opens the door to many possible threats [9]. Edge computing devices are open to integrating with various machine learning algorithms because of their software and resource vulnerabilities. Several works on the relevant topic will be the focus of this section. Recently, Blockchain has been integrated into cloud and IoT settings; a three-layer Software-Defined Network (SDN) architecture incorporating Blockchain was suggested by Sharma et al. The device layer, the first layer, collects the devices' data. The second layer, the fog layer, processed the raw data with the aid of the SDN controller. In addition, all of the processed data that has been received is stored on the third layer. Hence, they gathered, organized, and evaluated the real-time data acquired from the Internet of Things of Things. With the Edge Chain architecture's help, Pan et al. suggested it could lower the cost of end-to-end latency in intelligent contracts by moving processing resources to the edge of IoT devices. Internet of Things devices were able to access data gathered by edge devices. At its heart, Edge Chain is an idea to unite the resource pools of edge clouds by combining Blockchains with a currency system, all within the context of the Internet of Things (IoT). Without putting undue strain on the devices, they audited and recorded all transactions using Blockchains for security purposes. To provide privacy and security-based spatial-temporal contract services, Rahman et al. suggested an architecture based on Blockchain. This

system incorporates AI techniques while anchoring many fog nodes to the host's edge. They suggested a sharing economy system that would use Mobile Edge Computing, an off-chain architecture, and the installation of Blockchain technology to store immutable ledgers. The potential of edge computing to satisfy low latency, high security, and data privacy was addressed by Xu et al. The channel of the small distance between the power terminals and the edge computing equipment guarantees low latency during the collection of massive data. They used real-time data flow examples like intelligent energy system load balancing and power price forecasts to create a deep learning algorithm. Cloud computing frameworks were considerably more successful before implementing the network architecture using edge computing itineraries that adhered to security peculiarities. However, getting a handle on the edge computing architecture in general is challenging due to the security concerns with each node. With this obstacle in mind, they devised a security architecture called physical layer security, which would restrict participation to end-to-end users and operate within the constraints of available resources and energy. With the help of intelligent grids linked to edge computing, this article effectuated several AI prototypes to achieve the necessary efficiency and security.

Strengthening a society's and economy's key infrastructure system is crucial. Concerns about scalability and security are surfacing around the mountain of data produced by the proliferation of IoT devices. Crucial infrastructure in Industry 4.0, based on the Industrial Internet of Things (IIoT) or Industrial Internet of Things II (IIoT) [10]. This reference also included it in the Blockchain and edge computing paradigms. Additionally, they investigated potential entry points into the age of scalable and secure environments while working on a combination of these paradigms. They also looked at the current state of the art in terms of security and scalability. Ensuring privacy and security in an IoT setting is a challenging undertaking. The advent of Blockchain, a distributed ledger, alleviates some of the restrictions. In their presentation, Pajoo et al. detailed the improvements to Hyper-

ledger Fabric, a permission Blockchain that safeguards edge computing devices in an authenticated environment where locally employed processes are deployed. Addressing scaling issues, the suggested strategy additionally acquired data traceability from IoT devices. The integration of the Hyper-ledger Fabric Blockchain architecture with edge computing and the Internet of Things was discussed in the study. After that, they ran the tests on virtual desktops in VMware and real-world environments, including Raspberry Pi devices. Beyond this, they safeguarded the system by implementing authentication methods at the Internet of Things (IoT) nodes in each cluster and using multi-layered Blockchains [11]. The result was a significant increase in the speed of Internet of Things applications. Data storage security was a significant roadblock to the widespread adoption of edge computing despite its critical importance to the development of intelligent computing. The authors of proposed a plan to increase the trustworthiness and safety of the data kept at the edge by integrating Blockchain technology with regeneration code. They also used a cloud service to construct Blockchain layers worldwide. Additionally, they created a second pool of verifiers by developing local Blockchain at IoT terminals. Under the aegis of edge computing, resources were developed when residual nodes repaired terminals using regeneration coding. Kuo et al. also suggested ModelChain, a framework for training medical health predictions. This laid the groundwork for a medical health prediction framework and enabled several institutions to get training in a Blockchain setting utilizing sophisticated machine learning methods. The estimate of model parameters was supported by every site engaged in this. They used intelligent computing to include privacy-preserved models after applying transactional meta-data. One model that sheds light on the collaborative paradigm of IoT and Deep Learning methods was suggested by Rathore et al. and is based on the Blockchain. It is called Block-DeepNet. They confirmed that object detection under the IoT paradigm was compatible and feasible through experimental study. On the other hand, the suggested paradigm implied a need for more powerful

computers, rendering the implementation useless on machines with less processing power. Ferran et al. proposed DeepCoin, a Blockchain-based deep learning system for use in a Smart Grid setting. Thanks to a new energy system linked to Byzantine fault tolerance, it reached very high throughput. They took advantage of Blockchain technology's hash algorithms and brief signatures. Smart Grids were protected against assaults. In the realm of Cyber-Physical systems and Software-Defined networking, Singh et al. put forth an Internet of Things (IoT) architecture directed toward Deep Learning, aiming to create a safe smart city. They also assessed the current state of privacy and security and compared their model to others that took scalability and latency into account. However, issues arising from the concentration of workstations persist. Addressing security concerns, HE et al. investigated edge computing's effects on the Internet of Things. Based on a Blockchain context, they suggested a broad foundation for edge computing. To go a step further, they created a smart contract on the private Blockchain network to understand the challenges of edge computing resource allocation, emphasizing employing many service subscribers to good use. They demonstrated how AI and the Blockchain can work together. They also used simulations to ensure their approach could allocate resources accurately in Edge Computing. In their study, Dai et al. observed how intelligent computing enabled by the edge may impact medical prospects in the fight against COVID-19. They tackled issues such as medical data security, hysteria around digitization in healthcare, and the Internet of Medical Things' over-centralization of resources.

According to their research, a potential solution to the COVID-19 pandemic might be a combination of the Internet of Medical Things (IoMT) and Blockchain technology. However, they had to overcome several obstacles, including privacy concerns, latency, and a need for more relevant information. At the IoMT platform, they showcased an architecture that relies on Edge Intelligence operating in the sub-domain of Blockchain technology. After that, they tracked the steps taken to start the

pandemic and identified the supply chain that needed to be disrupted to stop the virus from spreading. The BCFL framework, developed by Li et al., combines Blockchain technology with a federated learning system. They covered all the bases, outlining the framework and delving deeper into the new paradigm's findings. They dug further into the BCFL framework's architecture and discussed the technology's problems and difficulties. Last but not least, they covered the framework's potential uses. Federated learning was introduced, and the possibilities it offers for mobile edge computing devices were explored by Nguyen et al. Issues of security and privacy, resource allocation, communication costs, and incentive systems were among the many subjects they investigated. In addition, they examined well-known applications of Blockchain-based Federated Learning in an edge-based network setting, such as edge crowd sensing, edge content caching, and edge-based data sharing. In an edge-based context, Zhang et al. suggested the architecture for data sharing in autonomous cars. Based on a locally Directed Acyclic Graph (DAG), the design combined permission-based Blockchain with federated learning systems. To top it all off, they used Deep Reinforcement Learning (DRL) techniques to pick out the critical nodes and even boost efficiency.

SMART COMPUTING AND EDGE COMPUTING

The World Wide Web, the Internet of Things (IoT), extensive data analysis, the cloud, machine learning, and computer science are some of the areas that might stand to profit from AI and other kinds of intelligent computing. Incompetent medical care, data from IoT sensors tracking a patient's vitals, nutrition, humidity, and motion, may be sent to a cloud-based server for later analysis and use [12]. Big data sets with thousands of records are used in conjunction with the power of cloud computing to run complex machine-acquiring knowledge and artificial intelligence calculations. "Get a full report on human health, including dietary and exercise suggestions, illness prognosis before the onset of symptoms, and more." 1 Innovative computing incorporates edge computing, where any computer or network resource

between the data source and the cloud service hub is considered to be at the "edge" of the computing model. "In edge computing, devices can delegate data storage and processing to network edge nodes such as base stations (BS), wireless access points (WAP), edge servers, etc." This approach caters to the computing needs of terminal equipment, allowing for expanded demand while reducing the volume of data transmitted between the server and the terminal device over the cloud's transmission link. Figure

Fig. 1. Architecture of edge computing

Illustrates the essential components of the edge computing architecture, comprising the Cloud Layer, Edge Layer, and the Internet of Things Layer." The Cloud Layer is where all the servers and apps that comprise the Internet's cloud computing infrastructure live. "Infrastructure as a Service," "Platform as a Service," and "Software as a Service" are the three fundamental service models that makeup "cloud computing." In edge computing, consumers can access centralized data storage and processing resources from various cloud service providers. This may involve deploying multiple layers of heterogeneous servers for large-scale compute migration, enabling real-time services and mobile agents to consumers in diverse geographic locations [13].

The Edge Centre, situated within the Edge Layer, oversees virtualization and other management services. This infrastructure, crucial to edge computing, is often

provided by suppliers of various physical infrastructures and incorporates multi-tenant virtualization technology. Edge data centres offer virtualization services accessible to multiple users, from service providers to end users and infrastructure suppliers. Additionally, the network's periphery often features multiple edge data centres that collaborate independently yet remain connected to the overarching cloud. This setup facilitates the realization of a distributed collaborative computing service pattern by developing a multi-tiered architecture leveraging various network technologies. Concerns about data security at the edge data centre are valid and should be addressed by users.

Edge network computing is a bridge that facilitates the connection of IoT devices and sensors, bridging the divide between various communication networks like wireless, mobile central, and the Internet. Within the Internet of Things framework, mobile terminals encompass all endpoints with the edge network. These terminals function as data consumers and suppliers, actively participating in the infrastructure at every level of decentralization.

With the increasing expansion of data volumes and the growing significance of real-time processing, the cloud's conventional centralized data processing model is evolving into a hybrid architecture that integrates features from both the cloud and the edge. Beyond their function as service requestors, network edge devices also undertake tasks such as storing, analyzing, searching, managing, and transmitting data

BLOCKCHAIN-BASED SECURITY FOR CLOUD COMPUTING

Cloud computing is a methodology for sharing computer resources via the Internet, such as servers, networks, applications, and data. Various implementation approaches have been created to tailor access to cloud resources to certain user groups, such as an organization's workers. Fig. 2 shows possible deployment types, including private, public, hybrid, and communal settings. Earlier, Gaetani et al. outlined a few Blockchains for cloud computing-related research problems. For the

European project SUNFISH, they provided precise, cutting-edge answers to these issues. In related work, Park et al. introduced the concept of Blockchain technology and proposed many avenues for future development in cloud computing. They also demonstrated the Blockchain-based, highly secure path to cloud computing across various characteristics. According to this article [43], some security services for IoT intermediaries were implemented using Blockchain technology. They then explored cloud computing and edge transparent computing technologies in depth [14]. IoT network security measures based on Blockchain were also accurately recognized. “Novel Blockchain-based distributed cloud architecture with SDN-enabled controller fog nodes at the network’s edge was presented in related work; the combination of fog computing, SDN, and Blockchain that they presented is also quite promising; the authors also provided an architecture that prioritizes reduced latency while maintaining high availability, real-time data collecting, better scalability, security, and resilience.” Parameters were then examined, including throughput, reaction time, and accuracy in detecting real-time threats. ??

CHALLENGES AND SOLUTIONS

Performance Scalability Scalability of performance is a major obstacle for blockchain applications. In order to ensure decentralization and security, the Bitcoin ledger, for example, specifies Blockchain in terms of its block size, consensus method, broadcasting algorithm, etc. For example, Bitcoin can only handle three to seven transactions per second simultaneously when the number of users skyrockets, all because of these limitations. In recent years, energy and knowledge trading have been two important use cases for the IBEC [15].

Resource Management When not in use, the IBEC’s many diverse edge devices may work with edge servers to provide services to neighboring devices. In addition,

Fig. 2. A notional architecture of Cloud computing

most devices in the network's periphery are resource- constrained, meaning they rely on other devices or edge servers for the resources they require to do their respective jobs.

Security Security issues with the IBEC manifest in two areas:(1) ensuring the safety of smart contracts and(2) efficiently identifying devices in the network's periphery. For example, the IBEC proposes using smart contracts to control access, identify identity, and allocate resources. Despite smart contracts many benefits – excellent efficiency, personalization, flexibility, automation, etc. – their security flaws, unchangeable mistake codes, and malicious programming lead to significant economic mishaps. Legal oversight of smart contracts is also lacking.

Privacy Computing Data sharing and knowledge discovery are fundamental in several IoV, IIoT, and intelligent healthcare applications. Knowledge discovery, for instance, requires a thorough examination of several patient records. Sharing GPS coordinates also helps fix aided autonomous driving mistakes. There will be a huge need for data sharing due to the proliferation of stakeholders and the dispersed nature of data produced by various devices and equipment, particularly in the network environments of the next generation.

FUTURE OUTCOMES

Blockchain, a new technological architecture that enables decentralized, safe storage systems, is the result of several different computer technologies coming together. The de- centralized blockchain models may increase data security and address the trust-lacking issues with conventional centralized organizations. Numerous sectors stand to gain from blockchain technology, which can reduce the need for centralized cloud services and storage. This article reviewed some of the many blockchain-based systems and applications. According to the research, blockchain technology will enhance solutions in several domains, including the Internet of Things (IoT), smart cities, and supply chain management. Future industrial growth will face both new possibilities and new problems brought forth by this.

CONCLUSION

Edge computing's broad adoption is being slowed by concerns about data security, which has consequences for the evolution of intelligent computing. The study presents a strategy that combines blockchain technology with regeneration coding to increase the safety and reliability of data storage in edge computing. "In order to make the most of the advantages of edge network devices and cloud storage servers, first, a hybrid storage construction and model under edge computing is given, taking into account the three-tier edge computing architecture and the needs for storing sensitive data." Data storage reliability is further enhanced by using regeneration coding. In addition, the Internet of Things terminals, the backbone of the regional Blockchain, completed the second verification. A local blockchain may be used to verify information stored in the cloud, offering an extra degree of protection. When data loss occurs at a terminal, it is prioritized for maintenance depending on the amount of power still available at the nodes and repaired using regeneration coding. As a result, under edge computing, each device's resources may be optimized, and excess ones avoided.

INTELLIGENT TRAFFIC MANAGEMENT SYSTEM USING YOLO MACHINE LEARNING MODEL

NAVEEN VIJAY T, RATHIS M, SAMIDURAI D, SETHUPATHI C,

Paavai Engineering College, Namakkal, India

ABSTRACT

People in today's era usually have the tendency of using their own private vehicles for commutation rather than using public transit and this result in large number of private vehicles on road. It leads to traffic congestion at every roads. In such scenario one cannot restrict individual to limit the usage of their private vehicles but we can able to manage traffic flow in a way that it doesn't alleviate congestion issues. The traditional traffic management approach works efficiently only if the traffic is less, but if the density of vehicles on a particular side of road increases on one side than other side, this approach fails. Hence, we aim to redesign the traffic signal system from static switching to dynamic signal switching, which can perform instant-time signal monitoring and handling. There are many projects emerging in order to convert the current transport system of cities to 'Smart system', by introducing Intelligent Transport System. Many initiatives are taken to design a system that can perform instant monitoring of traffic signals i.e., the traffic signal switching time will depend on the count of vehicles on each side of the road instead of predefined switching time. The switching time of signal will be decided based on vehicle detection in day-to-day traffic scenarios with good accuracy. This practice can prove its effectiveness in releasing the congested traffic at an efficient and faster rate.

In most of the developing countries which are overburdened by rising population and extreme poverty, increasing economic activities and opportunities in the cities result in rapid increase in urban population and consequent need for transportation

facilities. Authorities in these countries often fail to cope with the pressure of increasing population growth and economic activities in the cities, causing uncontrolled expansion of the cities, urban sprawl, traffic congestion and environmental degradation. Transportation and property are important in physical and economic development of towns.

INTRODUCTION

TRAFFIC MANAGEMENT SYSTEM

The history of Traffic Management System started in 1972 to centrally control the freeway system in the Twin Cities metro area. The Traffic Management System aims to provide motorists with a faster, safer trip on metro area freeways by optimizing the use of available freeway capacity, efficiently managing incidents and special events, providing traveller information, and providing incentives for ride sharing. Cities and traffic have developed hand-in-hand since the earliest large human settlements. The same forces that draw inhabitants to congregate in large urban areas also lead to sometimes intolerable levels of traffic congestion on urban streets. Cities are the powerhouses of economic growth for any country. Transportation system provides the way for movements and medium for reaching destinations. Inadequate transportation system hampers economic activities and creates hindrances for development.

The transportation route is part of distinct development pattern or road network and mostly described by regular street patterns as an indispensable factor of human existence, development and civilization. The route network coupled with increased transport investment result in changed levels of accessibility reflected through Cost-benefit analysis, savings in travel time and other benefits. These benefits are noticeable in increased catchment areas for services and facilities like shops, schools, offices, banks, and leisure activities. Road networks are observed in terms of its components of and cities all over the world. Property and land values tend to increase in areas with expanding transportation networks, and increase less rapidly

in areas without such improvements. Rapid and continued rise in housing and land prices are expected in cities with transportation improvements, rapid economic and population growth. The world would be severely limited in development without transportation, which is a key factor for physical and economic growth.

Developments of various transportation modes have become pivotal to physical and economic developments. Such modes include human portorage, railways, ropeways and cableways, pipelines, inland waterways, sea, air, and roads. Transport is critical to economic development, both low volume/rural roads and major arterials, and there is a direct relationship between a country's economic prosperity and kilometers of paved roads. Since, traffic congestion creates quite an obstruction for smooth functioning of public transports, thus leading to avoidance of those by common people. According to a survey, an average person spends about 300 hours every year, waiting on traffic signals, which boils down approximately to an hour daily. Thus, traffic is an important part of our lives, not only having an impact on our transportation but also have a significant effect on our urban environment. Thus, it is a necessity to have a better functioning traffic control system implementation. Generally, the traffic system is controlled by three signal lights- green, red and yellow. The reason for the traffic congestion (commonly termed as traffic jams) is increasing number of vehicles and poor management of traffic algorithms.

Machine Learning:

Machine learning (ML) means that the computer can figure out a solution without being specifically programmed. That is, machines are able to continuously learn and deal with huge datasets using classifier algorithms. Classifiers, which categorize observations, are considered the backbone of ML. Meanwhile, other ML algorithms are built models of behaviors and use those models as a basis for making future predictions based on new input data. The power of machine learning tools lies in detecting and analyzing network attacks without having to accurately describe them as previously defined. Machine learning can aid in solving the most common tasks

including regression, prediction, and classification in the era of extremely large amount of data and cybersecurity talent shortage. Machine-learning techniques have been applied in many aspects of network operation and management, where the system performance can be optimized and resources can be better utilized. Moreover, clustering and classification extract patterns out of data packets which can be used in many applications such as security analysis and user profiling. Furthermore, accessibility, connectivity and Traffic density, level of service, compactness and density of particular roads. Level of service is a measure by which the quality of service on transportation devices or infrastructure is determined, and it is a holistic approach considering several factors regarded as measures of traffic density and congestion rather than overall speed of the journey. Access to major roads provides relative advantages consequent upon which commercial users locate to enjoy the advantages. Modern businesses, industries, trades and general activities depend on transport and transport infrastructure, with movement of goods and services from place to place becoming vital and inseparable aspects of global and urban economic survival.

There is no fixed infrastructure for every junction, street and road which lead to loopholes in construction of fixed timing algorithms. Previously, human administrated or automated offline software were used for computation of time slots given to each signal at traffic signals. But these timings used to fail at specific times of the day or particular days (festivals etc.), which led to the development of self-automated online system in our project that continuously sense the environment and compute the timings to be given to traffic signal at a particular instant. The purpose of Traffic Management System is to improve transport operations and transport services profitability, reduce traffic jams and fatalities, provide sufficient driving, training, maintain road infrastructure, and maintain traffic law enforcement using the help of Machine Learning.

There are four steps of machine learning model that is useful for prediction for the prediction process.

1. Identify classes from training data.
2. Create a model using the training dataset that is being trained by ML algorithm.
3. During test phase, use the trained model to classify the unknown data and makes a prediction.
4. The prediction is evaluated for accuracy.

If the accuracy is not acceptable, the Machine Learning algorithm is trained repeatedly with an augmented training data set.

There are two main types of ML approaches, which are supervised and unsupervised.

Supervised learning: there are many applications for analyzing traffic based on the ML algorithms such as identifying anomalies through discovery-based workbooks or features that describe user behavior.

Intelligent Traffic Management System using Machine Learning:

With the highly rising traffic congestion all around the world, and its management by traditional approach are not efficient for smooth commutation purpose. Hence, there is a need to come up with a solution which can be globally accepted and would lead for the better management of traffic. In today's traditional approach the signal switches at its predefined regular interval, but the density of vehicles of the road at every signal doesn't remains the same, hence the static approach fails. Under such scenario, if the signal remains the same to switch at its regular interval then the side of road which is densely populated will always remain completely packed. As mentioned in above systems, till date they are to getting vehicle count only, so that comparative study and analysis of traffic can be done.

There are many projects emerging in order to convert the current transport system of cities to 'Smart system' and there are many initiatives under this, one of this is Intelligent Transport System. Many initiatives were taken to design a system that can

perform real-time monitoring of traffic signals i.e., the traffic signal switching time will not be predefined one, instead the switching time will depend on the count of vehicles on each side of the road. This process of getting the count of vehicle on the road can be achieved using various detection techniques. Techniques like Vehicle detection using sensors may fail at circumstances when the traffic gets denser at peak timings.

Our aim is to design and develop a miniature to depict the current road situation along with monitoring and handling the traffic issues. Hence to proceed with this project we are using a pre-trained YOLO Machine Learning Model to perform the task of object detection.

YOLO uses OpenCV for object detection along with multiple foreground and background subtraction and removal of noise from the input image. The CCTV cameras that are being used for surveillance purpose can be made use to capturing the footage of the road, this image will be passed to the pretrained model as input image. To do so each side of the road will be divided into particular frames of same height and width for capturing the image. The count obtained from the image is passed into a pre-defined Python program. As per the count obtained, switching time will be assigned for each side of road. The program will initially check if the count of vehicle in all lanes and then the signal switching will happen dynamically where the lane with It is a classification method, which trains the labeled data set to produce new prediction outputs, given input variables and output variables.

In Supervised learning, learning continues until the algorithm reaches an acceptable level of performance. The algorithm constantly predicts outcomes based on training data, and it is constantly corrected.

Unsupervised Learning:

This technique is called clustering method, where dataset does not need to be labeled; only input data will be given. The aim of unsupervised learning is to learn more about data by modeling infrastructure or basic distribution of data.

In our project, the supervised learning approach is used for traffic analysis purpose. We can create labeled data set and pre-train the model to produce the prediction outputs.

YOLO (You Only Look Once), is a network for object detection. It is the one of the most powerful pretrained model to give utmost accuracy. Yolo is a combined version of RCNN (Region-based Convolutional Neural Networks) and SSD (Single Shot Detector), both make YOLO much faster, efficient and powerful algorithm. By applying object detection algorithm in YOLO, one will not only be able to determine what is in an image, but also where a given object is placed i.e., the location. Also, the model is trained using huge dataset hence it can detect image placed in any random manner i.e., it can detect object even if they are rotated in 360 degree. YOLO is an efficient model by distinguishing between two very closely placed objects. Unlike traditional approach of applying classifier on each image and making prediction, YOLO look at the image once and but in a clever way. It divides the image into N numbers of partitions and into MxM grid. Now YOLO applies its algorithm one by one in partitions and predict confidence score/ Confidence score is the score that tells us whether object is present or not. On the basis of the confidence score, YOLO detects an object.

YOLO can process many frames with less execution time as compared to other pretrained models. YOLO computes its prediction in terms of precision and recall, precision measures how accurate the predictions are and recall measures how good we find all the positives i.e., how correctly the objects are classified. To increase its performance factor YOLO uses IoU, Intersection over Union is an evaluation metric used to measure the accuracy of an object detector on a particular dataset. IoU defines how two closely place objects can be easily detected without hampering the accuracy of the model. YOLO consist of two core components. One of the YOLO's component higher vehicle count will be opened first. , YOLO architecture is more like FCNN (fully convolutional neural network) and passes the image size NxN once

through the FCNN and output size is $M \times M$ prediction. This architecture is splitting the input image size as $M \times M$ grid and for each grid generation 2 bounding boxes and class probabilities for those bounding boxes is done.

SYSTEM ANALYSIS AND SPECIFICATION

SYSTEM ANALYSIS

Existing System With the highly rising traffic congestion all around the world, and its management by traditional approach are not efficient for smooth commutation purpose hence there is a need to come up with a solution which can be globally accepted and would lead for the better management of traffic. In today's world where technology has transcended all barriers it has now become easy to solve most human problems and one of these problems include Traffic Congestion. Traffic congestion has increased drastically over the years and has had negative impacts that include road rage, accidents, air pollution, wastage of fuel and most importantly unnecessary delays. The fact that encouraged proposing new solution is that in many cities of the world, the traffic signal allocation is still based on timer. The Timer Approach has a drawback that even when there is a less traffic in one of the roads, green signal is still allocated to the road till its timer value falls to 0, whereas the traffic on another road is comparably more faces red signal at that time. This causes congestion and time loss to commuters. Most of the present systems are not automated and are prone to human errors. There are many projects emerging in order to convert the current transport system of cities to 'Smart system' and there are many initiatives under this, one of this is Intelligent Transport System. Many initiatives were taken to design a system that can perform real-time monitoring of traffic signals i.e., the traffic signal switching time will not be predefined one, instead the switching time will depend on the count of vehicles on each side of the road.

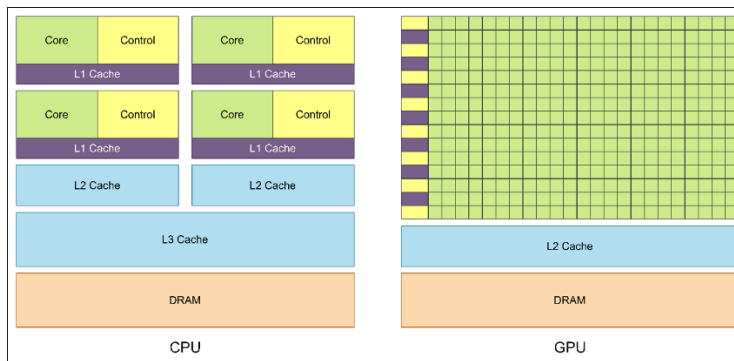

High-end Graphics Processing Unit: Machine learning models require a lot of computational power to run on. For any neural network, the training phase of the

deep learning model is the most resource-intensive task. Traditionally, the training phase of the deep learning pipeline takes the longest to achieve. This is not only a time-consuming process, but an expensive one. While training, a neural network takes in inputs, which are then processed in hidden layers using weights that are adjusted during training and the model then spits out a prediction. Weights are adjusted to find patterns in order to make better predictions. To significantly reduce training time, we can use machine learning GPUs, which enable us to perform AI computing operations in parallel. GPUs are optimized for training artificial R_CNN uses selective search algorithm and proposes accurate bounding box that definitely contains objects whereas the other component SSD that helps to speed up the processing of an image. Compared to other region proposal classification networks (fast RCNN) which perform detection on various region proposals and thus end up performing prediction multiple times for various regions in an image

PROPOSED SYSTEM

Our aim is to design and develop a machine learning model to handle the traffic signal switching by depicting the number of vehicles present in a road along with detection of different types of vehicles present in the road. The proposed system helps to develop a solution that analyses the presence of vehicles on the road and handles the traffic congestion issues, resulting in a better managed, more coordinated and smarter use of traffic networks. This can be done using the analysis of vehicle count data obtained from source like CCTV Cameras present in highways or in traffic signals, using a trained machine learning model called YOLO. YOLO is an OpenCV based machine learning model which does the Object Detection and counts the number of vehicles in a lane. The recorded data is then sent into the predefined python program where the machine learning model is already written and based on the obtained vehicle count data – we can dynamically switch the signal among the lanes. Thereby, round the clock safety and hassle-free traffic management can be obtained using Proposed Intelligent Traffic Management System.

Implementation of our project will eliminate the need for traffic personnel at various junctions for regulating traffic. Thus, the use of this technology is valuable for the analysis and performance improvement of road traffic. Also, priority to emergency vehicles has been the topic of some research in the past which can be enabled with further training of our machine learning of our model. Selecting the right GPU for our project: Selecting the GPUs for the implementation has significant budget and performance implications. We need to select GPUs that can support the project in the long run and have the ability to scale through integration and clustering. For large-scale projects, this means selecting production-grade or data center GPUs. In the GPU market, there are two main players i.e AMD and Nvidia. Nvidia GPUs are widely used for machine learning because they have extensive support in the forum software, drivers, CUDA, and cuDNN. So, in terms of AI and machine learning, NVIDIA is the pioneer for a long time. NVIDIA GPUs are the best supported in terms of machine learning libraries and integration with common frameworks, such as PyTorch or TensorFlow. The NVIDIA CUDA toolkit includes GPU-accelerated libraries, a C and C++ compiler and runtime, and optimization and debugging tools. It enables us to get started right away without worrying about building intelligence and deep learning models as they can process multiple computations simultaneously. GPUs are parallel processors designed to accelerate portions of a program, but not to replace CPU computing. The main program is executed on the CPU, but some code fragments, called kernels, are executed on the GPU. These Graphical processing units (GPUs) can reduce these costs, enabling us to run models with massive numbers of parameters quickly and efficiently. This is because GPUs enable us to parallelize the training tasks, distributing tasks over clusters of processors and performing compute operations simultaneously. GPUs are also optimized to perform target tasks, finishing computations faster than non-specialized hardware. These processors process the same tasks faster and free the CPUs for other tasks. This eliminates bottlenecks created by compute limitations.

Google Colab Cloud Environment: Google Colaboratory is an online cloud-based platform based on the Jupyter Notebook framework, designed mainly for use in machine learning operations. There are many distinguishing features that set it apart from any other coding environment.

REASON FOR CHOOSING GOOGLE COLAB OVER PC:

One of the main benefits of using Colab is that it has most of the common libraries that are needed for machine learning like TensorFlow, Keras, Scikit Learn, OpenCV, numpy, pandas, etc. pre-installed. Having all of these dependencies means that we can just open a notebook and start coding without having to set up anything at all. Any libraries that are not pre-installed can also be installed using standard terminal commands. While the syntax for executing terminal commands remains the same, one must add an exclamation mark (!) at the start of the command so that the compiler can identify it as a terminal command. Another feature is that the Colab environment is independent of the computing power of the computer itself. Since it is a cloud-based system, as long as there is an internet connectivity, even heavy machine learning operations can be run custom integrations. **NVIDIA CUDA Powered GPUs:** CUDA stands for 'Compute Unified Device Architecture' which was launched in the year 2007, it's a way in which we can achieve parallel computing and yield most out of GPU power in an optimized way, which results in much better performance while executing tasks. The CUDA toolkit is a complete package that consists of a development environment that is used to build applications that make

use of GPUs. Also, the CUDA runtime has its drivers so that it can communicate with the GPU. cuDNN is a neural network library that is GPU optimized and can take full advantage of Nvidia GPU. This library consists of the implementation of convolution, forward and backward propagation, activation functions, and pooling. It is a must library without which we cannot use GPU for training neural networks. The main difference between GPUs and CPUs is that GPUs devote proportionally more transistors to arithmetic logic units and fewer to caches and flow control as compared to CPUs. A GPU is smaller than a CPU but tends to have more logical cores (arithmetic logic units, control units and memory cache) than the latter.

Google Colab Cloud Environment: Google Colaboratory is an online cloud-based platform based on the Jupyter Notebook framework, designed mainly for use in machine learning operations. There are many distinguishing features that set it apart from any other coding environment.

Reason for choosing Google Colab over PC: One of the main benefits of using Colab is that it has most of the common libraries that are needed for machine learning like TensorFlow, Keras, Scikit Learn, OpenCV, numpy, pandas, etc. pre-installed. Having all of these dependencies means that we can just open a notebook and start coding without having to set up anything at all. Any libraries that are not pre-installed can also be installed using standard terminal commands. While the syntax for executing terminal commands remains the same, one must add an exclamation mark (!) at the start of the command so that the compiler can identify it as a terminal command. Another feature is that the Colab environment is independent of the computing power of the computer itself. Since it is a cloud-based system, as long as there is an internet connectivity, even heavy machine learning operations can be run

Reason for choosing Google Colab over PC: One of the main benefits of using Colab is that it has most of the common libraries that are needed for machine learning like TensorFlow, Keras, Scikit Learn, OpenCV, numpy, pandas, etc. pre-installed. Having all of these dependencies means that we can just open a notebook and start coding

without having to set up anything at all. Any libraries that are not pre-installed can also be installed using standard terminal commands. While the syntax for executing terminal commands remains the same, one must add an exclamation mark (!) at the start of the command so that the compiler can identify it as a terminal command. Another feature is that the Colab environment is independent of the computing power of the computer itself. Since it is a cloud-based system, as long as there is an internet connectivity, even heavy machine learning operations can be run from a relatively old computer that ordinarily wouldn't be able to handle the load of executing those operations locally. Additionally, Google also offers a GPU (Graphics Processing Unit) and a TPU (Tensor Processing Unit) for free. These hardware accelerators can run heavy machine learning operations on large datasets much faster than any local environment. While Colab allows uploading local files onto the runtime each time it is loaded, uploading and re-uploading large training datasets each time the runtime is restarted can be frustrating. Colab also offers data versatility, a simple alternative 'mount' Google Drive onto the Colab notebook. This operation requires just two lines of code that Colab inserts with the click of a button and this enables access to read files that is uploaded into Google Drive. This means that we don't have to reupload local files after every runtime restart. Simply uploading them once and access them simply by mounting the Google Drive solves the issue. Like the rest of Google's online document editing platforms like Google docs, Google Slides, Google Sheets, etc., Colab too offers similar sharing options allows to seamlessly collaborate with others on joint coding projects. One thing to keep in mind is that when a notebook is shared, other users cannot see the output and results from code that one has executed. Also, if one uploads some files from their computer to the notebook, other collaborators will not be able to see them so it is better to upload those files to Google Drive and then access them from there so everyone can see and use the files.

Software Requirements: Software requirements deal with defining software resource requirements and prerequisites that need to be installed on a computer to provide optimal functioning of an application. These requirements or prerequisites are generally not included in the software installation package and need to be installed separately before the software is installed. Some of the software requirements for our project are,

Operating System

Python (Programming Language)

Darknet (Neural-network framework)

Operating System An operating system is system software that manages computer hardware, software resources and provides common services for computer programs. Since we are using Google Colab Cloud Environment for our project, we will be using the services of Debian Linux Operating System. Reason for Debian to be the default operating system in Google Colab is because the Debian Family of Linux has official support for CUDA, Kubernetes, TensorFlow and Keras by default. So, it becomes easy for user work around our cloud environment with basic Linux commands.

Python Our machine learning model is written with Python programming language as it is the most preferred language for developing machine learning models. Python is a very useful programming language that has an easy-to-read syntax, and allows programmers to use fewer lines of code than would be possible in languages such as assembly, C, or Java.

Reasons for choosing Python : One of the key reasons for using Python for Machine Learning is its great library ecosystem. A library is a module or a group of modules published by different sources like 'PyPi' which include a pre-written piece of code that allows users to reach some functionality or perform different actions. Python libraries provide base level items so developers don't have to code them from the very beginning every time. Machine Learning requires continuous data

processing, and Python's libraries let users access, handle and transform data. These are some of the most widespread libraries namely,

Scikit-learn : For handling basic ML algorithms like clustering, linear and logistic regressions, regression, classification, and others.

Pandas : For high-level data structures and analysis. It allows merging and filtering of data, as well as gathering it from other external sources like Excel, for instance.

Keras : It allows fast calculations and prototyping, as it uses the GPU in addition to the CPU of the computer.

TensorFlow : For working with deep learning by setting up, training, and utilizing artificial neural networks with massive datasets..

Python for machine learning is a great choice, as it is very flexible. The flexibility factor decreases the possibility of errors, as programmers have a chance to take the situation under control and work in a comfortable environment.

It offers an option to choose either to use OOPs or scripting.

There's also no need to recompile the source code, developers can implement any changes and quickly see the results.

Programmers can combine Python and other languages to reach their goals.

Moreover, its flexibility allows developers to choose the programming styles which they are fully comfortable with or even combine these styles to solve different types of problems in the most efficient way.

Reason for choosing Darknet over the rest:

Darknet is mainly for Object Detection, and have different architecture, features than other deep learning frameworks. It is faster than many other NN architectures and approaches like FasterRCNN etc. One have to be in C if one needs speed, and most of the deep NN frameworks are written in c. TensorFlow has a broader scope in Machine Learning, but Darknet architecture & YOLO is a specialized framework, and it is in top of its game in speed and accuracy. YOLO can run on CPU but one can

get 500 times more speed on GPU as it leverages CUDA and cuDNN. Google Colab has a 'maximum lifetime' limit of running notebooks that is 12 hours with the browser open, and the 'Idle' notebook instance is interrupted after 90 minutes. In addition, a Google Account on Colab can run a maximum of 2 notebooks simultaneously. GPUs and TPUs are sometimes prioritized for users who use Colab interactively rather than for long-running computations, or for users who have recently used less resources in Colab. As a result, users who use Colab for long-running computations, or users who have recently used more resources in Colab, are more likely to run into usage limits and have their access to GPUs and TPUs temporarily restricted. Resources present in a Colab session's Storage will be automatically deleted once the session gets restarted, so we cannot access the files that are stored during the previous session after recycling it.

DARKNET FRAMEWORK:

Darknet is an open-source neural network framework like Keras, PyTorch and TensorFlow. Darknet is written in C and CUDA. It is fast, easy to install, and supports CPU and GPU computation. Darknet is installed with only two optional dependencies: OpenCV if users want a wider variety of supported image types or CUDA if they want GPU computation.

The framework features You Only Look Once (YOLO) Machine Learning

Algorithm, a state-of-the-art, real-time object detection system. On a Titan X it processes images at 40-90 FPS and has a mAP on VOC 2007 of 78.6% and a mAP of 44.0% on COCO test-dev. Darknet displays information as it loads the config file and weights then it can be enabled to classify the image and print the top-10 classes for the image. Moreover, the framework can be enabled to run neural networks backward in a feature appropriately named Darknet Nightmare.

Recurrent neural networks are powerful models for representing data that changes over time and Darknet can handle them without making use of CUDA or OpenCV. The framework also allows its users to venture into game-playing neural

networks. It features a neural network that predicts the most likely next moves in a game of Go. Users can play along with professional games and see what moves are likely to happen next, make it play itself, or try to play against it.

SOFTWARE REQUIREMENTS:

Software requirements deal with defining software resource requirements and prerequisites that need to be installed on a computer to provide optimal functioning of an application. These requirements or prerequisites are generally not included in the software installation package and need to be installed separately before the software is installed. Some of the software requirements for our project are,

Reason for choosing Darknet over the rest:

Darknet is mainly for Object Detection, and have different architecture, features than other deep learning frameworks. It is faster than many other NN architectures and approaches like FasterRCNN etc. One have to be in C if one needs speed, and

most of the deep NN frameworks are written in c. TensorFlow has a broader scope in Machine Learning, but Darknet architecture & YOLO is a specialized framework, and it is in top of its game in speed and accuracy. YOLO can run on CPU but one can get 500 times more speed on GPU as it leverages CUDA and cuDNN

Principle of YOLO :

YOLO is refreshingly simple, single convolutional network model that simultaneously predicts multiple bounding boxes and class probabilities for those boxes. YOLO trains on full images and directly optimizes detection performance. This unified model has several benefits over traditional methods of object detection. First, YOLO is extremely fast. Since we frame detection as a regression problem we don't need a complex pipeline. We simply run our neural network on a new image at test time to predict detections. Our base network runs at 45 frames per second with no batch processing on a Titan X GPU and a fast version runs at more than 150 fps. This means we can process streaming video in real-time with less than 25 milliseconds of latency Compared to other region proposal classification networks (fast RCNN) which perform detection on various region proposals and thus end up performing prediction multiple times for various regions in an image, Yolo architecture is more like FCNN (fully convolutional neural network) and passes the

image of size $N \times N$ once through the FCNN and output of size $M \times M$ prediction. YOLO architecture is splitting the input image in $M \times M$ grid and for each grid generation 2 bounding boxes and class probabilities for those bounding boxes. We reframe object detection as a single regression problem, straight from image pixels to bounding box coordinates and class probabilities. A single convolutional network simultaneously predicts multiple bounding boxes and class probabilities for those boxes. YOLO trains on full images and directly optimizes detection performance. This unified model has several benefits over traditional methods of object detection. First, YOLO is extremely fast. Since we frame detection as a regression problem, we don't need a complex pipeline. We simply run our neural network on a new image at test time to predict detections. Our base network runs at 45 frames per second with no batch processing on a Titan X GPU and a fast version runs at more than 150 fps. This means we can process streaming video in real-time with less than 25 milliseconds of latency.

Second, YOLO reasons globally about the image when making predictions. Unlike sliding window and region proposal-based techniques, YOLO sees the entire image during training and test time so it implicitly encodes contextual information about classes as well as their appearance. Fast R-CNN, a top detection method, mistakes background patches in an image for objects because it can't see the larger context. YOLO makes less than half the number of background errors compared to Fast R-CNN.

MODULE DESCRIPTION

Our proposed system consists of 4 modules and divided into 2 phases. The modules are namely,

1. Machine Learning Model Setup and Development
2. YOLO Machine Learning Model Training & Weight Creation
3. Vehicle Detection and Counting of Vehicles by YOLO Model
4. Dynamic Signal Switching

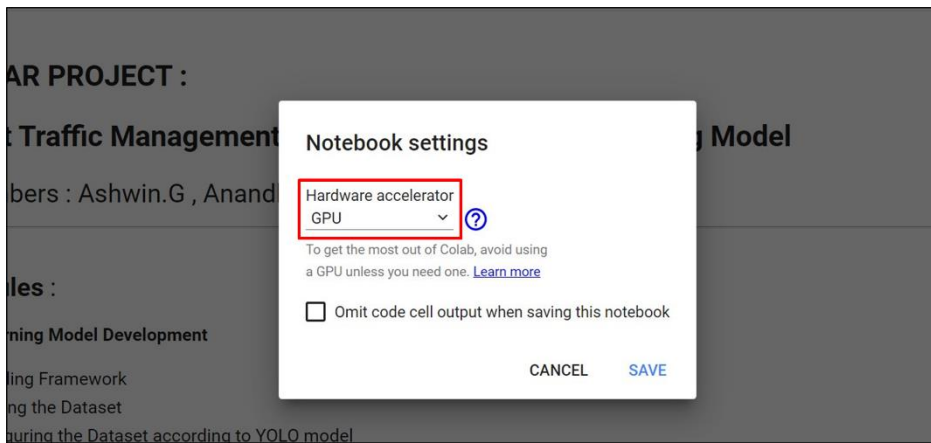

Machine Learning Model Setup and Development:

Before starting to develop our machine learning model with our own dataset, we must prepare the suitable environment for our model to develop it in a faster way – because creation of a machine learning model is a tedious process and it takes huge computation power to develop it. So, we are developing our machine learning model in Google Colab, which will drastically save our computation time and helps us to develop comparably faster than what it might actually take to develop in our personal computer. Google

Colab Environment's automatically provisioned computation power is arguably 100x faster than the computation capability of our local host.

Setting up the Google Colab Environment: As we knew already, Google Colab Cloud Environment will dynamically provision resources for each session based on our computations. Since we are need to train the dataset for developing a fully-functioning YOLO Machine Learning Model, we must change the Runtime Instance of our current Google Colab Session into GPU/TPU Runtime. Third, YOLO learns generalizable representations of objects. When trained on natural images and tested on artwork, YOLO outperforms top detection methods like DPM and R-CNN by a wide margin. Since YOLO is highly generalizable it is less likely to break down when applied to new domains or unexpected inputs.

Our network uses features from the entire image to predict each bounding box. It also predicts all bounding boxes across all classes for an image simultaneously. This means our network reasons globally about the full image and all the objects in the image. The YOLO design enables end-to-end training and real-time speeds while maintaining high average precision.

Makefile is a program building tool which runs on Unix, Linux, and their flavors. It aids in simplifying building program executables that may need various modules. To determine how the modules need to be compiled or recompiled together, make takes the help of user-defined makefile. As we knew that NVIDIA Tesla K80 is the GPU present in our runtime environment, we can now install the darknet neural-network framework now by creating a folder called

“darknet” and cloning the GitHub repository of Darknet. Once after cloning the darknet framework into our environment, start creating the configuration file for our darknet framework inside the darknet folder. We must modify and overwrite the “make file” (configuration) for our Darknet framework which is compatible with the computations that will be required for training our machine learning model using this framework. Compute capability of a GPU determines its general specifications and available features. Since our GPU is NVIDIA Tesla K80, the compute capability of our GPU is 30, which needs to be set in the ‘Make File’ of Darknet Framework. Since the Colab's GPU dependencies shift from time to time automatically, we need to run the makefile after checking the actual dependency to which our Colab Notebook is currently connected to. Currently, our Colab Notebook is connected to NVIDIA Tesla K80 GPU. If the GPU is shifted to another GPU, we need to tweak the ‘Make File’ accordingly. For example, with the Cityscape dataset is one of the most widely adapted for developing the object detection algorithms, but for India, where

traffic violations are rampant, these datasets can't be inculcated to ensure safer road travel.

- 1.Pixel counts for each label in the y axis.
- 2.The four-level label hierarchy and the label ids for intermediate levels (level 2, level 3)
- 3.The color coding used for the prediction and ground truth masks are given to the corresponding masks.

DATASET COLLECTION:

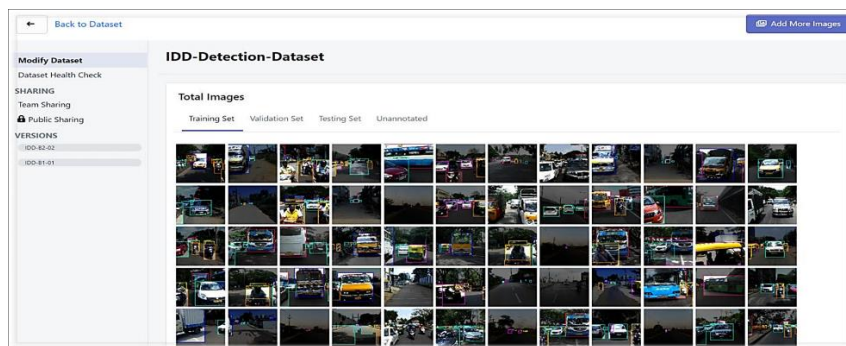

For developing a machine learning model, one need to create an image dataset first. A dataset assembles a collection of images that are labeled and used as references for objects that are used by the developers to test, train and evaluate the performance of their algorithms. Algorithms trained with larger datasets perform significantly better than those trained on smaller ones. With more data come more variations and the algorithm can learn from the myriads of differences of the visual world. The quality of the model depends on the quality of the data set input. Creating a dataset is not always a simple matter. We must collect, annotate, convert into model supported format and then insert the dataset into the model for training the data which might take hours to several days.

DATASET USED IN OUR MODEL:

While several datasets are already available to develop machine learning models, they tend to focus on neatly structured driving environments. This usually corresponds to well-delineated infrastructure such as lanes, a small number of well-defined categories for traffic participants, low variation in object or background appearance and strict adherence to traffic rules. We chose IDD – India Driving Dataset as a main source of training images for our project. IDD is a novel dataset for road scene understanding in unstructured environments where the above assumptions are largely not satisfied. It consists of 10,004 images, finely annotated with 34 classes collected from 182 drive sequences on Indian roads. The label set is

expanded in comparison to popular benchmarks such as Cityscapes, to account for new classes. It also reflects label distributions of road scenes significantly different from existing datasets, with most classes displaying greater within-class diversity.

Our dataset annotations have unique labels like billboard, auto-rickshaw, animal etc. We also focus on identifying probable safe driving areas beside the road. The labels for the dataset are organized as a 4-level hierarchy. Unique integer identifiers are given for each of these levels. The histogram bellow gives:

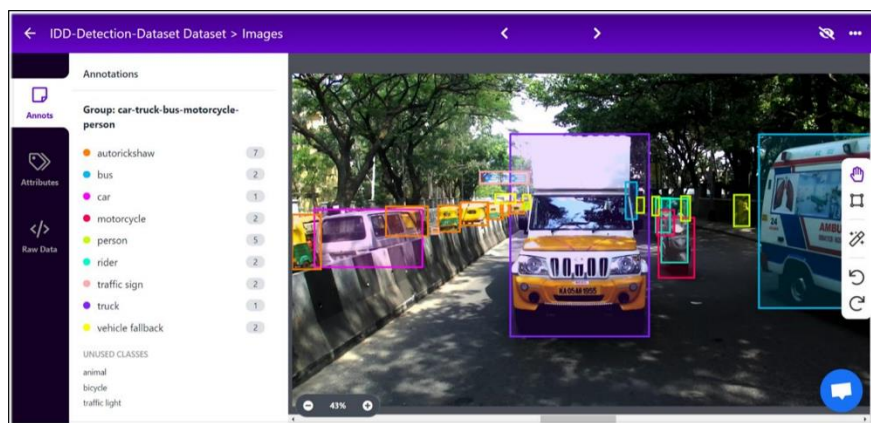

Roboflow accepts images along with its XML files where we have the details of our annotation. As IDD Dataset comes pre-annotated with the help of XML files with them, we can upload the image as well as it's XML file into Roboflow which largely conserves our preparation time for pre-annotated dataset images. In addition to that, we can use the existing dataset as a part of custom dataset that we are planning to create. Like in our case where we are creating a dataset with IDD Dataset as a main contributor and vehicle images from web search as part of our dataset. Here, only the images from IDD Dataset are already annotated and the files that we have

uploaded from sources like Google Open-Images Dataset and Google Search might be missing the annotation for them. Roboflow even offers free annotation tool which filters the images in our custom dataset with missing annotation and helps us annotate those images.

During the Dataset Generation process in Roboflow, we can split the dataset as training , validation and testing set which might help us validate how well the model gets trained with this dataset. We can also upload images as batches and save different versions of same dataset in Roboflow.

Roboflow offers various other image pre-processing services like Auto-Orient Images, resizing all the dataset images, merging color channels to make our model faster and insensitive to subject color. Boosting contrasts based on the image's histogram to improve normalization and line detection in varying lighting conditions. Roboflow just like Google Colab is a freemium service where we have to pay for using it above limited service. So, we can opt for premium option if we wish to scale up the size of our dataset.

Currently, our project's training was done until 1406 iterations - which nearly took 5 hours with 82 hours of training left and 67488 images getting trained. Here the 67488 images are not the actual 67488 images, because a single image can be divided into $N \times N$ grid, so the actual set of images trained is unclear currently.

At the end of training, we will be able to notice the “weights” necessary for functioning of our machine learning model.

To test whether the trained weight is able to detect objects present in a sample image, we can pass that image into the detector present in Darknet framework.

With our testing results, we conclude that our weights are good to go for Vehicle Detection with our YOLO Machine Learning Model. The Weights can be extended with further training of the model with additional training data and the weights will continue to with better accuracy in extensive training.

YOLO MACHINE LEARNING MODEL AND VEHICLE DETECTION:

The YOLO(YouLookOnlyOnce) model is a combined version of RCNN and SSD for object detection which gives utmost accuracy and also it is a much faster, efficient and powerful algorithm. The YOLO framework (You Only Look Once) takes the entire image in a single instance and predicts the bounding box coordinates and class probabilities for these boxes. The biggest advantage of using YOLO is its superb speed – it’s incredibly fast and can process 45 frames per second. It outperforms other detection methods, including DPM (Deformable Parts Models) and R-CNN. YOLO reframes object detection as a single regression problem instead of a classification problem. This system only looks at the image once to detect what objects are present and where they are, hence the name YOLO(YouLookOnlyOnce). Also, the model can be trained using huge dataset hence it can detect image placed in any random manner. i.e., it can detect object even if they are rotated in 360 degree. Unlike traditional approach of applying classifier on each image and making prediction, YOLO first takes an input data, and then divides the input data grids. Image classification and localization are applied on each grid. YOLO then predicts the bounding boxes and their corresponding class probabilities for objects if present. Now YOLO applies its algorithm one by one in partitions and predict confidence score, confidence score is the scores that tells us whether object is present or not. On the basis of the confidence score YOLO detects an object.

Dataset Extraction: Using the API Key obtained at the end of conversion of dataset by Roboflow, we can now the same to unzip the dataset in our Google Colab Cloud Environment Notebook. After unzipping process, we can now start setting up the directory path for our YOLO – Darknet Framework to detect the extracted data. Once the extraction process is done, we must write the configuration file for our model based on the number of classes available in our dataset used for training. We build the configuration file iteratively from the base configuration file available on the Darknet Framework’s cloned open-source repository. Soon after setting up the configuration file’s variables, we can now know that the file is written in our runtime with the help of output displayed at the end of execution. Now, the model can be started to train. The model runs on the configuration file that we have created moments ago.

4.2.3. Dataset Training & Weight Creation: Now, we will be using the YOLO Darknet Detector to train the model. When the mAP for first 1000 iterations are done, now the mAP score is calculated and then mAP score will be calculated after further 100 iterations at 1100 iterations. At 1100 iterations - the mAP(mean Average Precision) Score is calculated and compared with the previous mAP score and the training continues for 1200 iterations. This process continues for hours/days according to the size of the dataset and the files that are present.

YOLO MODEL - NETWORK ARCHITECTURE:

Our YOLO model has 24 convolutional layers followed by 2 fully connected layers. It uses 1 x 1 reduction layers followed by a 3 x 3 convolutional layer. The 7x7 layer(rightmost) is one of the many bounding boxes that is classified by our YOLO Model. Our model applies its algorithm in each of these many bounding boxes that our model has already classified. The entire process is explained below [5].

The system here divides the input image received, into an $S \times S$ grid. Each of these grid cells predicts B bounding boxes and confidence scores for these boxes. The confidence score indicates how sure the model is that the box contains an object and

also how accurate it thinks the box is that predicts. The confidence score can be calculated using the formula:

$$C = \text{Pr}(\text{object}) * \text{IoU}$$

IoU: Intersection over Union between the predicted box and the ground truth. If no object exists in a cell, its confidence score should be zero.

Each grid cell also predicts C conditional class probabilities $\text{Pr}(\text{Class } i \mid \text{Object})$. It only predicts one set of class probabilities per grid cell, regardless of the number of boxes B . During testing, these conditional class probabilities are multiplied by individual box confidence predictions which give class-specific confidence scores for each box. These scores show both the probability of that class and how well the box fits the object.

$$\text{Pr}(\text{Class } i \mid \text{Object}) * \text{Pr}(\text{Object}) * \text{IoU} = \text{Pr}(\text{Class } i) * \text{IoU}.$$

The final predictions of a confidence score are encoded as, $S \times S \times (B * 5 + C)$.

Intersection Over Union (IoU)

Usually, the threshold for IoU is kept as greater than 0.5. Although many researchers apply a much more stringent threshold like 0.6 or 0.7. If a bounding box has an IoU less than the specified threshold, that bounding box is not taken into consideration.

Looking at the boxes, someone may visually feel it is good enough to conclude that the model detected the car object. Someone else may feel the model is not yet accurate as the predicted box does not fit the ground-truth box well.

To objectively judge whether the model predicted the box location correctly or not, a threshold is used. If the model predicts a box with an IoU score greater than or equal to the threshold, then there is a high overlap between the predicted box and one of the ground-truth boxes. This means the model was able to detect an object successfully. The detected region is classified as Positive (i.e., contains an object). On the other hand, when the IoU score is smaller than the threshold, then the model made a bad prediction as the predicted box does not overlap with the ground-truth

box. This means the detected region is classified as Negative (i.e., does not contain an object).

$$\text{class}(IoU) = \begin{cases} \text{Positive} \rightarrow IoU \geq \text{Threshold} \\ \text{Negative} \rightarrow IoU < \text{Threshold} \end{cases}$$

Fig:IoU and the use of Threshold Value

Non-Maximum Suppression:

The algorithm may find multiple detections of the same object. Non-max suppression is a technique by which the algorithm detects the object only once. Consider an example where the algorithm detected three bounding boxes for the same object.

The probabilities of the boxes are 0.7, 0.9, and 0.6 respectively. To remove the duplicates, we are first going to select the box with the highest probability and output that as a prediction. Then eliminate any bounding box with $IoU > 0.5$ (or any threshold value) with the predicted output. The result will be:

VEHICLE DETECTION:

After the development of the model, we must pass an input image into the model as an argument to the startup program. The python program will initially start

importing necessary libraries required for running the program along with packages from other directories. After importing all necessary libraries and packages. With loading the input from the arguments passed into the model, the model loads the 'weights' file for the model which was saved by us earlier from the second module of our project. Along with the weights the model loads the directories of configuration file and the names file containing the dataset label names. Then, the model checks if a GPU is present in the local runtime to boost the speed of the machine learning model. Now the model enters the vehicle detection phase. The model once again checks for if the image is present from the passes input argument path. Now the image enters the image processing phase. The input image is now resized into 416*416 resolution, which helps in better performance of the model to detect inputs. This configuration is built-in already in YOLO's configuration file. The resized image is then returned as a tensor variable into the model. Now the model uses the neural network weights to detect the input with bounding boxes initially and then perform non-max suppression and the detected output is displayed as result.

FUTURE WORK

The timer-approach can be enabled to come into existence when the model fails to detect at crucial times like bad weather and low visibility initially. The system can be added with cloud computation support in the future so that the system can log the traffic of respective lanes with date and time which will be highly effective in analyzing the traffic data for further improvement of roads This scenario can be vastly minimized with extended use of our model, since the machine learning models can learn to adapt to different scenarios with continuous use. Our model is able to add even more custom-functions to the program like closing signal for pedestrians crossing, priority for lane with ambulance and vehicle monitoring etc.,

VEHICLE COUNT & DYNAMIC SIGNAL SWITCHING:

As we have developed the YOLO model to count the number of vehicles present from an input source, the model detects the vehicles from the image and then counts the number of vehicles present in the given source. The count obtained from the source can now be passed into the python program for determining the threshold value of each lane which we have predefined already. The python program now compares the count of vehicles from each lane and executes further steps in the next module. The obtained data is then sent to the computer system in which we have written a python program that processes the input information and we have already predefined a threshold value based on the count of vehicles. So that the system determines the priority of each lane to open the signal. If all model detects no vehicles or same number of vehicles on each lane, the model will automatically switch to static signal switching approach.

CONCLUSION:

The main objective of Intelligent Traffic Management system is founded to fix the problem of traffic which most of the cities in urban as well as rural areas are facing with the help of this project wherein the focus would be to minimize the vehicular congestion. The setup requires traffic data as input which will then be used with our machine learning model for efficient traffic flow without creating much chaos on the road. The model may take comparatively more training time but the response time will be less. The model is prepared in such a way that it decides smart switching timing for the signal on all sides of the road so the no one has to wait for longer interval of time on the road and flow of traffic is smooth on the road. Since the system learns from time to time, the system can be updated in future to become fully-autonomous with training and learning.

ABSTRACT

Finding missing persons based on face recognition using AI is a promising approach that can significantly improve the speed and accuracy of missing person searches. The system involves using AI algorithms to match facial images of missing persons with real-time video footage from surveillance cameras. This paper proposes a method for finding missing persons using face recognition technology in video surveillance systems. The system involves collecting data about the missing person, building a database of facial images, and using AI algorithms to match those images with real-time video footage. Artificial intelligence (AI) is a field of computer science that aims to develop intelligent machines that can perform tasks that typically require human intelligence. This includes tasks such as visual perception, speech recognition, decision-making, and language translation. AI systems are designed to learn from data, using machine learning algorithms that allow them to improve their performance over time. Deep learning, a subset of machine learning, has emerged as a powerful technique for training artificial neural networks with many layers, enabling AI systems to recognize complex patterns and make accurate predictions. The system can be implemented in public spaces, such as airports and train stations, to quickly identify and locate missing persons. The proposed system has the potential to significantly improve the speed and accuracy of missing person searches, thereby increasing the likelihood of successful reunions. Finding missing persons based on face recognition using Convolutional Neural Network (CNN) algorithm is a popular approach that has shown promising results. CNN is a deep learning algorithm that is widely used for image recognition and classification tasks, making it suitable for face recognition.

INTRODUCTION

Artificial Intelligence has become a potent instrument in multiple fields, such as data analysis, natural language processing, and computer vision. Using AI's capabilities allows for the automation and enhancement of the search process, producing results that are more accurate and efficient. AI can be extremely helpful in locating missing people by detecting possible sightings, evaluating pertinent data, and supporting search teams and law enforcement in their work. Facial identification and analysis are one important area where artificial intelligence can have an impact. It takes cooperation between several agencies and groups to find missing people, as it is a difficult and complex undertaking. By analysing vast amounts of data and offering insights that can speed up and improve the efficiency of missing person searches, artificial intelligence (AI) has the potential to be a useful tool in this process. Facial recognition, natural language processing, predictive modelling, autonomous drones, geographical analysis, behavioural analysis, collaborative filtering, and machine learning are just a few of the ways artificial intelligence (AI) can be used to locate missing people. Using patterns and data analysis, these AI-powered methods can assist in finding possible leads and ranking search engine optimization efforts. But it's crucial to combine artificial intelligence (AI) with conventional search and rescue methods, and to make sure that AI systems respect human rights and privacy and are open, transparent, and accountable. AI and human investigators can enhance the efficiency of missing person searches and give families and loved one's closure by cooperating. Apart from the aforementioned methods, artificial intelligence can also be employed in different ways to locate those who have vanished. AI algorithms, for instance, can be used to analyse meteorological and environmental data, like temperature, wind direction, and precipitation, to forecast missing people's likely locations. AI algorithms, for instance, can be used to analyse meteorological and environmental data, like temperature, wind direction, and precipitation, to forecast missing people's likely locations. Similar to this, artificial intelligence (AI) can be used to analyse social media data in order to spot patterns or

anomalies that can point to the missing person's location or to find people who might be able to provide information. In addition, AI may be utilized to trace the movements of possible suspects or missing people by analysing data from security cameras and other sources. This can be especially helpful when there isn't much information on the missing individual or when the search area is big and challenging to cover. The basic flow chart is shown in fig 1

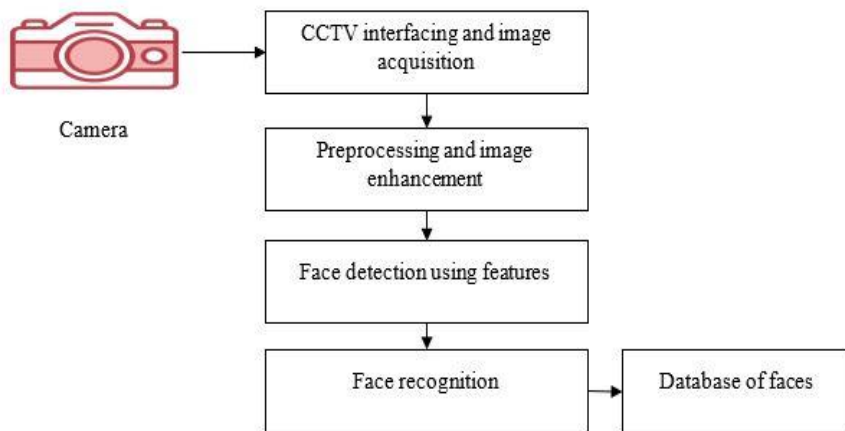

FIG 1: FLOW CHART FOR MISSING PERSON DETECTION USING AI

RELATED WORK

XIN NING, et.al,...[1] implemented person re-identification, as a technology for retrieving specific person images from cameras in multiple nonoverlapping areas, has pivotal applications in the security field, including target tracking and person retrieval. In such tasks, the image pixels of the person are too low to be identifiable through face recognition. Moreover, the images have rather intricate backgrounds, which are also accompanied by occlusions and variations in person's poses. As cameras with disparate orientations normally have dissimilar viewing angles, the difficulty of person recognition is also increased thereby. Hence, person re-identification has invariably been a challenging task. The performance of person re-identification, which is a subtopic of image recognition, largely depends on the representation of a person's features. In recent years, image recognition has entered a new stage owing to multilayer convolution-based deep learning methods. This paper reports a feature selection network that combines global and local fine-grained features to realize person reidentification. The proposed model explores more

valuable features by weakening the salient features, and obtaining diverse fine-grained features after eliminating interference information. Through experiments, the state-of-the-art performance of the Feature refinement and filter network on the mainstream datasets for person re-identification is verified

YIMING WU, et.al,...[2] proposed part-based approaches employ spatial and temporal attention to extract representative local features. While correlations between parts are ignored in the previous methods, to leverage the relations of different parts, we propose an innovative adaptive graph representation learning scheme for video person Re-ID, which enables the contextual interactions between relevant regional features. Specifically, we exploit the pose alignment connection and the feature affinity connection to construct an adaptive structure-aware adjacency graph, which models the intrinsic relations between graph nodes. We perform feature propagation on the adjacency graph to refine regional features iteratively, and the neighbour nodes' information is taken into account for part feature representation. This paper proposes an innovative graph representation learning approach for video person Re-ID. The proposed method can learn an adaptive structure-aware adjacency graph over the spatial person regions. By aggregating the contextual messages from neighbors for each node, the intrinsic affinity structure information among person feature nodes is captured adaptively, and the complementary contextual information is further propagated to enrich the person feature representations

Xiujun shu, et.al,...[3] contributed a novel Large-scale Spatio-Temporal (LaST) person re-ID dataset, including 10,862 identities with more than 228k images. Compared with existing datasets, LaST presents more challenging and high-diversity reID settings and significantly larger spatial and temporal ranges. This work studies large-scale spatio-temporal person reidentification. This task has much larger spatial and temporal spans than previous settings. Our major contribution is the large-scale benchmark dataset called LaST. It is the largest densely annotated re-ID benchmark and the first one to label clothes to date. By careful collection, the style of LaST is very similar to conventional re-ID datasets. Besides, we propose an simple but effective baseline that works well on such challenging person re-ID setting. Specifically, the mAP is directly optimized during training and achieves competitive performance compared with current methods. By conducting extensive experiments, we demonstrate that LaST has good generalization ability in both short-term and cloth-changing

scenarios. We believe that there is still much room for improvement in the large-scale spatio-temporal settings. By releasing LaST, we expect this dataset to catalyze research in the re-ID community and propel the maturation of re-ID techniques in real-world applications.

Jiaxu miao, et.al,...[4] focused on the occlusion problem in person reidentification (re-id), which is one of the main challenges in real-world person retrieval scenarios. Previous methods on the occluded re-id problem usually assume that only the probes are occluded, thereby removing occlusions by manually cropping. However, this may not always hold in practice. This paper relaxes this assumption and investigates a more general occlusion problem, where both the probe and gallery images could be occluded. The key to this challenging problem is depressing the noise information by identifying bodies and occlusions. We propose to incorporate the pose information into the re-id framework, which benefits the model in three aspects. First, it provides the location of the body. We then design a Pose-Masked Feature Branch to make our model focus on the body region only and filter those noise features brought by occlusions. Second, the estimated pose reveals which body parts are visible, giving us a hint to construct more informative person features. We propose a Pose-Embedded Feature Branch to adaptively re-calibrate channel-wise feature responses based on the visible body parts. Third, in testing, the estimated pose indicates which regions are informative and reliable for both probe and gallery images. Then we explicitly split the extracted spatial feature into parts

Houjing huang, et.al,...[5] aims to predicted whether two images from different cameras belong to the same person. With large-scale datasets, as well as improved feature extraction and metric learning methods, recent years have seen great progress in this task. However, due to degraded image quality, pose and view point variation, etc., it still remains a tough problem. We reckon that the increased diversity between part features in turn spans a larger and more discriminative space for identification. Through Grad-cam visualization on MGN, we also discover that the proposed method helps ReID model to emphasize on more regions on human body. We believe that it reduces the risk of overfitting to salient body regions and facilitates learning comprehensive ReID features. Extensive ablation experiments are also conducted to analyze key factors of the proposed method, including part granularity in segmentation supervision, structure of the segmentation head, impact on each part, etc. To be complete, we also confirm that the improvement in ReID is generalizable across domains.

Generally speaking, it is desirable for a ReID model to capture discriminative features that well represent body regions, in order for accurate identification. From this perspective, we believe that the awareness of body parts should be an underlying capability of the model. However, in most existing methods, the model is merely supervised by identity labels. We argue that these models may be short of part sensitivity. To enhance such ability of a ReID model, we propose to train ReID with an additional task of part perception. Concretely, we connect a lightweight segmentation head to the backbone and supervise it with part labels, during the training of a normal ReID model

BACKGROUND OF THE WORK

Reports of missing persons worldwide have increased significantly in the past recent years, from roughly 450,000 in 1990 to about 10,000,000 this year. The increase was driven in part by the ever-growing population. The numbers indicate that more people are becoming victims each day. An astounding 2,300 Americans are reported missing every day, including both adults and children. More recently, the abductions of children and adults have reawakened public concern about missing people. In most parts of the world, the police and non-governmental organizations working with missing people have recently reviewed their policies and are planning to improve coordination of their work. People end up missing in different scenarios. The circumstances that may lead adults or children to become missing people are often complex and multi-layered. The missing phenomenon is best understood as a continuum in which a break in contact may be either intentional or unintentional. Some people make a conscious decision to leave, albeit often not in circumstances of their own choosing, while others may drift apart from family members over time. Some may never have intended to be missing, and indeed may not conceptualize their experience in these terms, while others may be forced apart through the actions of others. Some of the causes entailed herein are natural disasters, psychological complications, abduction and domestic conflicts. Manual System for finding missing person have very long procedure and takes more time. More time is required for launching an FIR (First Information Report) in police station. Also, time required for finding lost person is more. Also, during manual process amount of manpower for searching lost person is less. Some existing application does not

show the proper information about the Missing person, which is difficult to find out missing person. Some missing person related website only shows the database of missing person.

PROPOSED METHODOLOGY

In today's world, where kidnapping and human trafficking never fails to grab the headlines, biometrics, especially facial aspects of the person become the most crucial assets to trace the person. Whenever suspicious people are found to be doing laborious tasks in places they should not be, it ignites a spark of doubt in the minds of common citizens that whether the person belongs to that occupation. But due to lack of resources or the proper means of acquiring knowledge about the same, the common citizens fail to turn into vigilant citizens of the nation. This leads to the sacrifice of thousands of people daily due to the sheer negligence of the citizens. If only each citizen had the authority or the privilege of saving these people, the world would have prospered with every citizen taking the charge of every nation. There is an urgency to stop the various cases of kidnapping, trafficking, prostitution and all other illegal activities where people are being forced without any hope of help. This project proposes a system that would help the police and the public by accelerating the process of searching using face recognition. When a person goes missing, the people related to that person or the police can upload the picture of the person which will get stored in the database. In proposed system detect and recognize the faces by using Eigen object detector algorithm with Deep learning. This can be done with the help of OpenCV with haar cascades which are present in the OpenCV integral. The images which are taken from the camera are detected with haarcascade frontal faces and eyes then trained with CNN algorithm, the trained faces are kept in a database first and equated to the trained images after comparing it will make a log of the system to the recognized persons in surveillance videos. Fig 2 shows the proposed work for missing person detection.

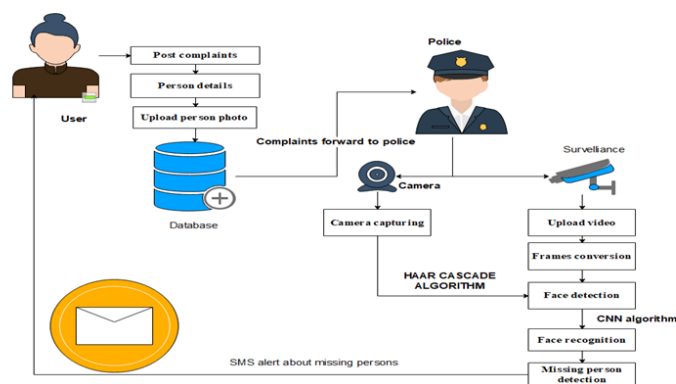

Fig 2: Proposed architecture

The extracted features of the face are called as a face print or feature vector or simply a template. It will compare the two faces by the similarities of their features. Here utilize the features of CNN for classifying images. CNN has multiple layers of functions to accurately classify the images with dataset. Based on the similarities the matching is calculated. Based upon the result of template matching the final decision is made to determine whether the suspect is identified or not.

CNN (Convolutional Neural Network) algorithm is a popular deep learning approach for image recognition tasks. Here is an overview of how CNN algorithm can be used for missing person detection using AI:

Data collection: Collect visual data such as CCTV footage, satellite imagery, and social media posts that may contain images of the missing person or potential clues related to their whereabouts.

Data preprocessing: Preprocess the collected data to ensure that it is in a format that can be used by the CNN. Resize the images, convert them to grayscale, and normalize them.

Feature extraction: Use convolutional layers and pooling layers to extract low-level and high-level features from the images. These layers detect features such as edges, shapes, and textures.

Training the model: Provide the CNN model with labeled images (i.e., images that are either of the missing person or not) and adjust the model's parameters to minimize the difference between the predicted and actual labels.

Prediction: Use the trained CNN model to make predictions on new, unseen images. The CNN model can be used to detect the missing person or potential clues related to their whereabouts.

Techniques to enhance accuracy and efficiency: Use data augmentation to artificially generate new images and increase the size of the training set. Use transfer learning to reuse pre-trained CNN models to improve the performance on a specific task.

By using a CNN algorithm for missing person detection, AI can help law enforcement agencies to efficiently and accurately process large amounts of visual data, which can help to find missing persons more quickly and increase the chances of a successful search and rescue operation. Fig 3 shows CNN algorithm for face recognition

Fig 3: CNN framework for face recognition

EXPERIMENTAL RESULTS

Real-time datasets were used in this chapter. Face detection and recognition algorithms were used in this framework. And totally 10 samples are tested in framework. The performance can then be evaluated using accuracy measures. The accuracy metric is assessed as follows: $\ast 100$

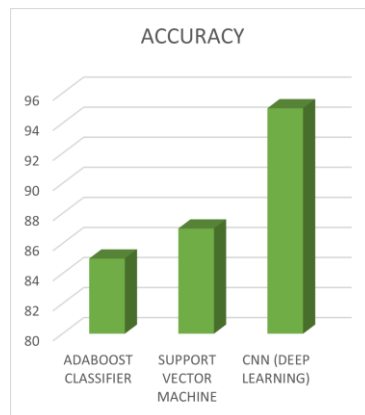

Fig 4: Performance graph

Fig 4 shows the graph, CNN algorithm provides improved accuracy rate in existing machine learning algorithms.

CONCLUSION

In conclusion, missing person detection using CNNs is a powerful tool that can help locate missing individuals by analysing images of them. The process involves collecting and pre-processing a dataset of images, building a deep learning model using a CNN, training the model, testing its accuracy, and deploying it for use in missing person detection. While this approach has several advantages, including its ability to accurately identify individuals in images even when there is partial occlusion or changes in lighting conditions, it also requires a large dataset for training, careful pre-processing, and expertise in deep learning. With continued advancements in deep learning and computer vision, missing person detection using CNNs has the potential to become an even more effective tool for locating missing individuals.

ABSTRACT

Machine learning can be considered as a branch of Artificial intelligence, which lets computers learn from data and experience without explicit programming. Intelligent systems that are capable of handling difficult tasks like computer vision, speech recognition, natural language processing, recommendation systems, and more may be developed using machine learning. Three primary categories of machine learning exist: reinforcement learning, unsupervised learning, and supervised learning.

The Digital Twin Technology is one of the newest innovations used in the age of modern production. A Digital Twin is an exact replica of a physical product, it replicates, not just the physical object but also its behavior and its entire life cycle. Digital Twin is a combination of technologies such as artificial intelligence (AI), Machine Learning (ML), Internet of Things (IoT) and Data Analytics. Digital twin technologies play a crucial role in the training of shopfloor employees and their skill development. This research could focus on how to design training programs that effectively use digital twins to develop employee skills.

INTRODUCTION

Machine learning is a subset with in AI that is more focussed on the self-learning algorithm that derive knowledge from the data in order to predict outcomes. It can be

defined as tools and technology that can be used to answer questions with the data we provide. The study of algorithms and models that can learn from data to carry out operations like clustering, regression, classification, and so on is known as machine learning. Robots, self-driving vehicles, chatbots, and other intelligent systems are examples of systems that possess the ability to see, reason, learn, and act in complex and unpredictable settings. Intelligent systems require machine learning to be able to adapt to changing conditions and gradually enhance their performance. By utilizing existing datasets, Machine learning enables machines to learn from previous experiences autonomously and construct models that are suitable for predicting future behaviour.

Digital Twin is a digital representation of a physical body or a process, where a physical entity is replicated into a digitally simulated body. The mirror body or the twin body is a reflection of the whole life cycle process of the corresponding physical entity product. It is a bi-directional mapping relationship that exists between physical space and virtual space.

By integrating and visualizing data from around the world, this concept helps to make a better decisions. With Digital Twins, Plans can be simulated before being implemented, exposing problems before they become a reality. Foreseeing any potential problem and accommodate users in visualizing, processing, and analysing multiple, large and complex georeferenced data is a main benefit. Digital twin technology has the potential to revolutionize employee training and skill development in manufacturing environments. By creating a virtual replica of the production line or manufacturing process, employees can gain hands-on experience with the equipment and processes in a safe and controlled environment.

ML Learning programs and TYPES

A computer program which learns from experience without being explicitly programmed is called machine learning. We have a model defined up to a few parameters, and learning is the execution of a computer program that uses training data or previous experience to optimize the model's parameters.

Components of Learning Process

Models can be predictive, to make predictions about the future, or descriptive, to derive insights from data, or both.

Data storage, abstraction, generalization, and evaluation are four components of the learning process, whether it is done by humans or machines.

Data Storage: Storing and retrieving huge amounts of data are an important component of the learning process. Whether it is a Humans or computer data storage is a foundation for advanced reasoning. The learning process is the same in both cases.

Abstraction: The process of obtaining information regarding stored data is called abstraction. Developing broad notions about the data is required for this. Application of existing models and development of new models are both necessary for knowledge generation. Training is the process of adapting a model to a dataset. The data is converted into an abstract form that condenses the original information once the model has been trained.

Generalization: The process of transforming information about stored data into a format that may be applied to future actions is known as generalization. Finding the aspects of the data that will be most useful for the next tasks is the aim of generalization.

Evaluation: Evaluation is the process of gauging the usefulness of newly acquired knowledge that involves providing the user with feedback. The entire learning process is then improved by using this input.

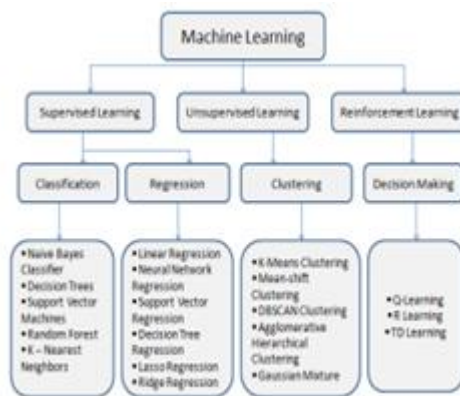

ML has been applied to various domains and problems, such as education, healthcare, network security, banking and finance, and social media. The chart below shows the projected market size by region and application for the year 2028. Later 2019 and first half of 2020, the market witnessed negative growth due to the spread of the COVID-19 virus. The market for application development software was estimated to be worth USD 131.4 billion globally in 2020, and between 2021 and 2028, it is expected to expand at a compound annual growth rate (CAGR) of 24.3%.

Intelligent systems in machine learning can be classified into three categories:

1. Supervised Learning:
2. Unsupervised Learning.
3. Reinforcement Learning:

Below the detailed categorization of Machine Learning

1. Supervised Learning

Supervised learning or supervised machine learning is a subcategory of machine learning. Here the ML algorithm is trained on labelled data. It classifies the data and predicts outcomes. The ML algorithm is given a small training dataset to work with and this dataset is a part of a big dataset that serves to give the algorithm a very basic idea of the problem. Then the algorithm will find the relationships between the parameters and establish a cause-and-effect relationship between the variables in the dataset. After completing this the algorithm will have an idea of how the data works and the relationship between the input and output and finally the solution is deployed for use with the final dataset. The application of supervised learning depends on the usecases.

E.g.: Risk Assessment, Image Classification, Fraud Detection, customer Retention etc.

Unsupervised Learning

ML algorithm is trained on unlabeled data where

human labor is not required to make the dataset machine-readable, allowing much larger datasets to be worked on by the program. This results in the creation of hidden structures and relationship between the datapoints are perceived by the algorithm. It can adapt to the data by dynamically changing hidden structures. Techniques of unsupervised learning include clustering which helps to identify sets of data about same topic and Dimensionality reduction which helps to reduce number of variables and visualize the data.

**E.g.: User categorization by their social media activity,
Principal Component Analysis, Clustering**

Reinforcement Learning

This is based on the trial-and-error method. This deals with how to learn control strategies to interact with the complex environment. It is inspired by the way humans and animals learn from their own actions and the rewards or penalties they receive.

Reinforcement learning is suitable for solving complex problems that involve sequential decision making, such as games, robotics, self-driving cars, and natural language processing.

E.g: Robots equipped with visual sensors to learn about their surrounding environment, Scanners to understand and interpret text.

SHOPFLOOR EMPLOYEES AND DIGITAL TWIN

Shopfloor employees are those who work in production areas. Shopfloor and the activities in it are essential for every manufacturing company. Shop floor management can be found in all manufacturing companies, and it plays an important role in ensuring competitiveness. Digital twin is built with the help of real time data and algorithms. This can be used in product design, simulation, monitoring, optimization, decision making and servicing. Using predictive analysis, it can provide valuable insights for future planning and development. This way it helps shopfloor employees to test and better understand the product or process in the early stages by minimizing downtime thereby reducing the costs.

There is a constant update between the real one and the virtual entity, here the data is flowing constantly back and forth. In training, digital twins can be used to simulate real-world scenarios, allowing learners to practice and develop skills in a safe, controlled environment which helps to improve learning outcomes and reduce risks associated with the training on physical assets. Digital twin technology integrates AI Software analytics and machine learning data to create a digital simulation model that updates and changes as their physical counterpart's change.

Following are some of the key applications of Digital Twin:

Helps to predict set up and material requirements.

Machine learning algorithms help to analyze historical data to predict future demands more precisely.

Optimize resource allocation, predict downtime, anticipating bottle necks and ensure a smooth workflow.

It also helps in simulating and validating the production process in the 3D environment, reducing the need for physical prototypes.

Digital twin Technology coupled with Machine Learning mainly involves 7 steps:

- Data Gathering
- Data preparation
- Data Wrangling

- Data Analysis
- Training the model
- Testing the model
- Deployment

One of the key components of machine learning is the "model", which is a mathematical representation of the problem and the solution. To create a model, we need to provide it with "training", which is a set of examples that show the desired input-output relationship. However, data is required to train a model, therefore the life cycle begins with data collection. By training the model, we can improve its accuracy and performance on new data.

Data Preparation is a process where we use the collected data and use it for our machine learning training.

This step includes two steps:

Data exploration is used to understand nature of data and Data preprocessing to preprocess the analyzed data.

Data wrangling is the process of cleaning and converting the raw data into usable format.

Data Analysis helps to build a model using various analytical techniques. Then build the model with the prepared data and evaluate the model.

Next step is to train the model where datasets are used along with various machine learning algorithms,

Once training is done, we test for accuracy of the model by providing a test dataset to it.

The final step is the deployment where we deploy the model in a real -world system.

Some characteristics of Intelligent systems are:

They can adapt to changing environments and situations.

They can interact with other systems and humans in natural and intuitive ways.

They can process large amounts of data and information from multiple sources and modalities.

Intelligent systems can help users make better decisions by providing recommendations, alternatives, feedback, etc.

They can exhibit creativity and innovation in generating solutions and outcomes.

Intelligent systems can understand and communicate in natural languages

Intelligent systems can recognize and analyze images, such as faces, objects, scenes, etc.

They can self-monitor and self-improve their performance and behavior.

Intelligent systems can improve its performance and reduce errors by analyzing its own actions and outcomes.

They can also perform tasks that require human intelligence, such as reasoning, planning, creativity, etc.

HOW DIGITAL TWIN LEVERAGE TRAINING EFFECTIVENESS

Learning from Data: This is focused on creating systems that can learn and improve from their own experience.

Adaptable and Generalizable System: Key strength of Machine learning is its ability to make predictions on new unseen data which is crucial for intelligent systems to perform well in diverse and dynamic environments.

Natural Language Processing (NLP): Deals with the interaction between computers and human languages which includes various tasks such as speech recognition, natural language understanding, natural language generation, machine translation, sentiment analysis, text summarization, and more.

Computer Vision: Machine learning approaches are employed in various computer vision domains, including image recognition and segmentation for objects. These capabilities enable intelligent systems to interpret visual data from the environment.

Neural Networks and Deep Learning: Neural networks are computational models that mimic the structure and function of biological neurons, while deep learning is a technique that uses multiple layers of neural neurons which each layer learning to extract different features and patterns from the data.

Continuous Improvement: As machine learning-based intelligent systems are exposed to more and more data over time, their performance can improve significantly. Intelligent systems are distinguished by their ability to adapt and learn.

APPLICATION OF ML TOWARDS INTELLIGENT SYSTEMS

ML has been applied to various domains and problems, such as education, healthcare, network security, banking and finance, and social media.

The chart below shows the projected market size by region and application for the year 2028. Later 2019 and first half of 2020, the market witnessed negative growth due to the

spread of the COVID-19 virus. The market for application development software was estimated to be worth USD 131.4 billion globally in 2020, and between 2021 and 2028, it is expected to expand at a compound annual growth rate (CAGR) of 24.3%.

Throughout the course of the forecast period, the market expansion is anticipated to be supported by the growing demand for a variety of software applications that streamline and expedite corporate operations via the use of modern IoT technologies and cloud-based solutions.

FEDERATED LEARNING

Within the area of ML, one promising paradigm to adopt is federated learning. According to the evaluation factors, the accuracy factor has a high percentage in the FL-based IoT domain by 29%, along with the epoch, time, energy consumption, delay, communication overhead, and privacy. Other important evaluation factors include epoch, time, energy consumption, delay, and privacy. IoT designers and analysts are working together to amplify the innovation on an expansive scale and to advantage society to the most elevated conceivable level.

Billions of IoT gadgets will be sent within the close future, taking advantage of the quicker Web speed and the plausibility of orders of greatness more endpoints brought by 5G/6G. With the blossoming of IoT gadgets, vast quantities of information that will contain the private data of clients will be created. The tall communication and capacity costs, blended with security concerns, will progressively be challenging the conventional environment of centralized over-the-cloud learning and handling for IoT stages. Unified Learning (FL) has developed as the foremost promising elective approach to this issue.

The advantages of utilizing federated learning in IoT applications are improved data security, data diversity, low-latency network communication, hardware efficiency and enhanced learning. Combined learning models can work with diverse machine learning strategies, but information sort and setting are critical. Potential applications may be learning exercises of portable phone clients, independent vehicles and anticipating wellbeing dangers from wearable devices. With these special points of interest, FL has been proposed for utilize in an assortment of IoT applications, such as keen healthcare, smart transportation, Unmanned Ethereal Vehicles (UAVs), etc.

We have distinguished seven challenges that act as the key boundaries of empowering FL on possibly billions of IoT devices. These challenges come from

- 1) The limited assets of the IoT gadgets
- 2) Restricted network bandwidth accessible at the edge
- 3) Irregular connectivity and accessibility commonly happened in real-world settings
- 4) The differing qualities of IoT gadgets over their accessible assets
- 5) the transient flow after arrangements
- 6) How to protect from the ill-disposed assaults and total client information securely
- 7) The need for standardization and framework improvement apparatuses within the community.

EDUCATION

With the help of machine learning (ML), instructors may create individualized learning pathways for each student, evaluate their progress and offer constructive criticism, spot knowledge and skill gaps, and suggest resources and solutions. Additionally, ML may support kids in exploring their interests, learning new subjects, and developing their creative and problem-solving skills. One can identify the learning style of the learner and provide the recommended learning strategy that fits each learner individually. Using Machine learning technology and its algorithms, we can explore the effectiveness of Learning Management System (LMS) in higher education to support teaching and learning in this 'new normal' by providing a stand-alone platform for online & distance learning. With e-learning, students may access course materials at any time, from any location, even when they are not in a traditional classroom.

HEALTHCARE

It is widely accepted that ML and AI technologies will support and improve human labour rather than completely replace that of doctors and other healthcare professionals. AI is prepared to assist healthcare workers in a range of duties, including clinical documentation, patient outreach, administrative processing, and specialist help in areas like image analysis, patient monitoring, and medical device automation. ML applications for drug discovery can be divided into three main categories: ligand-based, structure-based, and network-based.

Ligand-based approaches find novel compounds with similar capabilities by utilizing the chemical characteristics of existing active molecules. Structure-based approaches model the binding affinity and specificity of ligands and target proteins using their three-dimensional structures. Network-based approaches deduce the functional links between target proteins and ligands by utilizing their biological networks, which also help to find possible therapeutic candidates. ML applications for drug discovery are faster, more scalable, and more accurate than conventional techniques. They do, however, also must deal with issues like generalizability, interpretability, and data quality. Consequently, to guarantee their dependability and use, machine learning programs for drug discovery need to be carefully designed, validated, and integrated with other data sources.

Disease Diagnosis Applications: This includes medical imaging, pathology, disease risk prediction, drug discovery remote monitoring and telehealth, early warning systems etc...Artificial intelligence uses CT scans, electrocardiograms (ECG), cardiac MRI images, skin images, retinal scans, and X-Ray scans to detect cancer, stroke, diabetes, and other diseases. ML algorithms make use of large volumes of high-quality healthcare data to classify or predict diseases with comparable or even better accuracy than human experts.

Treatment Applications: Includes Personalized treatment plans, drug discovery and development, real time decision support, predictive analysis, rehabilitation and physical therapy, surgical assistance etc... AI - ML-driven treatment applications in healthcare have the potential to improve patient outcomes, reduce costs, and enhance the overall quality of care. However, ethical considerations, regulatory compliance, and the need for collaboration between ML algorithms and healthcare professionals are essential for the safe and effective implementation of these technologies.

Drug Discovery Applications: ML-driven treatment applications in healthcare have the potential to improve patient outcomes, reduce costs, and enhance the overall quality of care. However, ethical considerations, regulatory compliance, and the need for collaboration between AI/ML and healthcare professionals are essential for the safe and effective implementation of these technologies

Personalized Medicine Applications: Personalized medicine has the potential to revolutionize healthcare by providing more effective and efficient treatments while reducing adverse reactions and unnecessary treatments. It emphasizes the importance of an

individual's unique genetic and clinical profile in healthcare decision-making. However, implementing personalized medicine involves addressing ethical, privacy, and data-sharing considerations, as well as the need for specialized training for healthcare professionals and integration into clinical practice

Precision medicine: Precision medicine is an emerging approach to healthcare that aims to tailor treatments and interventions to the individual characteristics of each patient, such as their genetic profile, lifestyle, and environmental factors. AI is used to produce personalized treatment plans for patients that take into account such factors as their medical history, environmental factors, lifestyles, and genetic makeup.

Precision medicine projects come in a variety of forms, however they may generally be categorized into three kinds of clinical areas:

Complex algorithms: Large datasets, including genetic, demographic, and electronic health record data, are fed into machine learning algorithms to predict prognosis and choose the best course of therapy.

Digital health applications: Health monitoring data from wearables, mobile sensors, and other sources, as well as data entered by patients on their food intake, exercise, and emotional state, are all recorded and processed by healthcare apps. Several of these applications are classified as precision medicine apps because they employ machine learning algorithms to identify patterns in the data, improve forecasts, and provide tailored treatment recommendations.

Omics-based tests: Machine learning algorithms are combined with genetic data from a population pool to identify patterns and forecast a patient's reaction to therapy. To enable individualized therapies, machine learning is used with various indicators, such as protein expression, gut microbiota, and metabolic profile, in addition to genetic data.

Perform Robot assisted surgery that can perform surgical procedures, assist in rehabilitation, and provide social and emotional support for patients.

Analyse X- ray, CT and MRI scans, to diagnose medical conditions

Associated Care: Associate care AI is a term that refers to the use of artificial intelligence (AI) to assist, augment, or automate the tasks of healthcare professionals, such as doctors, nurses, pharmacists, and therapists.

Expanded access to medical services - Expanded access to medical services is a crucial goal for improving the health and well-being of people around the world. Many countries face challenges in providing adequate and affordable health care to their populations, especially in rural and remote areas.

Wearable devices and sensors that can monitor vital signs, track activity, and alert users and caregivers of potential health issues.

Natural language processing systems that can extract information from clinical notes and records, generate summaries and reports, and facilitate communication between patients and providers

BANKING AND FINANCE

In banking and finance, machine learning (ML) has several uses, including portfolio optimization, fraud detection, credit scoring, risk management, and client segmentation. In addition to lowering costs and lowering risks, machine learning (ML) may assist banks and other financial organizations increase customer happiness, efficiency, and accuracy. Researchers believe that ML algorithms can be used to predict individual risk in the credit portfolios of institutions.

Fraud Detection: ML can detect fraud by analysing customer or entity patterns, anomalies, and behaviours.

Credit Scoring: Machine learning can aid in evaluating the creditworthiness of borrowers or applicants by considering factors like income, spending habits, payment history, and social media activity.

Customer Service: ML can enhance customer satisfaction and loyalty through personalized recommendations, offers, or solutions based on customer preferences, needs, or feedback.

Risk Management: ML enables the optimization of risk management strategies by forecasting market trends and evaluating the impact of different actions or outcomes.

Portfolio Management: - Portfolio management: ML helps improve portfolio performance and diversification by selecting the best assets, strategies, or allocations based on market conditions, objectives, or constraints.

ACKNOWLEDGEMENTS

I would like to express my deep and sincere gratitude to my research supervisor Dr. V. Raghavendran, Assistant Professor, Department of Computer Science, VISTAS, Chennai for giving me the opportunity to do the research and provide invaluable guidance. He has taught me the methodology to carry out the research and to present the research works as clearly as possible. It was a great privilege and honour to work and study under his guidance

CONCLUSION

Machine learning is not a magic bullet that can solve any problem automatically. It requires careful design, implementation, testing, and evaluation of the system, as well as human feedback and supervision. Machine learning is a powerful tool that can augment our capabilities and intelligence, but it cannot replace them. machine learning is a foundational technology that supports the development of intelligent systems by providing the ability to learn from data and make informed decisions in complex and dynamic environments. The synergy between machine learning and intelligent systems is essential for the development of artificial intelligence applications in various fields.

By leveraging digital twin technology for shopfloor employee training, organizations can create a dynamic, engaging, and effective learning environment that enhances skills, promotes safety, and adapts to the evolving needs of the workforce.

ABSTRACT

The subsequent driving reason for death overall is disease. All around, the normality of infection has truly extended; basically in the US alone, around 1,665,540 people experienced harmful development, and 585,720 of them passed on account of this disorder by 2014 1. Thus, infection is a troublesome issue impacting the strength of each and every human culture. Tragically, it is a collection ailment at the tissue level and this grouping is challenging for its specific decision, followed by reasonability of treatment 2, 3. In men, the most vital paces of dangerous development types occur in the prostate, lung and bronchus, colon and rectum, and urinary bladder, independently. In women, dangerous development normality is most raised in the chest, lung and bronchus, colon and rectum, uterine corpus and thyroid, independently. This data shows that prostate and chest illness contain a critical piece of harmful development in individuals, independently 4. For adolescents, the most raised rate sorts of threatening development sickness are blood illness, and growths associated with the brain and lymph center points, independently 5, 6. Illness occurs by a movement of moderate changes in characteristics so these changes change cell capacities. Malignant growth cells and quality changes are obviously brought about by synthetic mixtures. Furthermore, smoking incorporates a couple of disease-causing substances heightens that lead to cell breakdown in the lungs 7. Oddly, normal compound substances with malignant growth causing properties influence clearly or indirectly the cytoplasm and center of

cells, and lead to innate issues and quality changes 8, 9, 10, 11. Diseases, organisms and radiation radiates are other carcinogenesis factors, including around 7% of all threatening developments 12. Malignant growth by and large outcomes in the brokenness of fundamental qualities and disturbs the connections between cells. This exacerbation is personal in the cell cycle, and prompts surprising development 13, 14. Proto-oncogenes are responsible for cell division and improvement under common condition, but become oncogenes during inherited change, which are by and large risky for cell presence 15. Likewise, the shortfall of development silencer characteristics triggers uncontrolled cells division 16.

KEYWORDS

Development sickness, blood illness, and growths

INTRODUCTION

Skin disease is one of the most serious medical conditions on the planet on account of its higher frequency rate than different sorts of malignant growth. All around, melanoma is an unprecedented harmful development, but in the past fifty years, the general occasion of melanoma has fundamentally risen. Truly, it is one of the obvious sicknesses in typical extended lengths of life lost per passing. Adding to the strain, the financial load of melanoma treatment is moreover exorbitant. Out of the \$8.1 Billion in all skin illness treatment costs in the USA, \$3.3 Billion are spent solely on Melanoma. Squamous Cell Carcinoma and Basal Cell Carcinoma, are broadly reparable at whatever point broke down and treated on at the outset stages. The five-year perseverance speed of patients with starting stage assurance of melanoma is around near 100 percent. Subsequently, helpful area of skin infection is the basic consider reducing the passing rate.

Various exploratory examinations plan to foster programmed skin disease recognition and upgrade determination precision. In the going with, the compositions on these undertakings are investigated. Similarly, to achieve a strong

skin dangerous development area circumstance, the right way data which is figured out in this paper has all the earmarks of being huge.

OBJECTIVE AND SCOPE

The development of a cutting-edge Python model for the classification of skin lesion images into their respective cancer types is the primary objective of this project. The model is prepared and tried on the dataset made accessible by Worldwide Skin Imaging Joint effort (ISIC). The model can be utilized for dissecting the sore picture and see whether it's perilous at beginning phase.

Skin conditions are the most common around the world. A PC supported skin illness conclusion model is proposed as a more goal and reliable arrangement since dermatologists need an elevated degree of skill and accuracy to analyses skin sicknesses

EXISTING FRAMEWORK

The consequence of the assessment was used to evaluate how IR warm imaging systems could be used to assess the significance of skin contamination. Astoundingly convincing techniques for picture division. The division technique made here the two gets express perceptually immense non-nearby picture credits

Detriments

During disease, the essential objective of CpG hypermethylation is encoding qualities that are connected with subunits of changing chromatin buildings, like CHD5. This condition prompts a lessening of its disposition and a disrupting impact in the standard development of chromatin

PROPOSED STRATEGY

Pre-communication and section the region of interest of the consume picture. Perform layout coordinating and remove second elements for include extraction. Multi-mark portrayal of consume using probabilistic cerebrum association and KNN. . Knowing the profundity of the consume is fundamental for choosing a

proper one; an exact visual evaluation of the profundity of the consume requires specific dermatological skill. As the cost of keeping a Consume Unit is outstandingly high, it would be alluring to have a customized structure to give a first assessment in all of the close by clinical centers, where there is a shortfall of prepared experts.

Benefits

Despite adjustment of HDAC verbalization in various dangerous developments, for instance, colon sickness, lung and leukemia, irritation in histone acetylation occurs through ectopic changes and deletion in Cap and its associated characteristics. 48. These events might be a significant reason for malignant growth development. Moreover, harmful development cells lost H4K16ac, H3K4me3, H4K20me3 and H3K27me3 49. Change in the assignment of histone methylation is essentially a result of enunciation of histone methyltransferases and histone demethylase. Furthermore, weakening changes in SETD2 (a histone methyltransferase) and UTX (a histone demethylase) occurs during renal carcinoma 50. In leukemia, MLL oncoprotein prompts weird instances of H3K4 and H3K29 methylation

SYSTEM IMPLEMENTATION

DERMIS PICTURE

Responsible for collecting, organizing, and preprocessing skin image data. Involves loading images, resizing, normalizing pixel values, and applying augmentation techniques. The primary stage incorporates the picture input where a consume picture is taken as an info. The principal strategy in pre-handling the picture includes ascertaining the sharpness of the picture. Post that versatile limit is applied what isolates forefront from foundation with non-uniform brightening. Additionally, edge recognition is performed utilizing the watchful edge location technique which finds the limits of the article for our situation it's the copied region inside pictures and works by identifying the irregularity in brilliance.

HIGHLIGHT EXTRACTION

During the process of categorizing the images into various categories, this step is extremely crucial. The chose highlights address the characters of the pictures having a place with specific level of consume. The color and texture of the wound determine the degree of burn, so these characteristics are the primary criteria for classification. Moment feature-based extraction is carried out, and the burn's invariant moment

features are automatically selected for classifier training. The 8 invariant second capabilities are applied and includes gathered are taken care of into the probabilistic brain network for additional multi-name arrangement.

MODEL ARCHITECTURE MODULE

Defines the architecture of the Convolutional Neural Network (CNN) for image classification. Comprises layers such as convolutional, pooling, fully connected, and output layers. Incorporates activation functions and appropriate kernel sizes for feature extraction.

```

def CNN_Convolutional_Neural_Network
    IN [3]: image_size = (100,100,3)

    model = Sequential()
    model.add(Conv2D(32,(3,3),activation = 'relu', input_shape = image_size))
    model.add(MaxPooling2D())

    model.add(Conv2D(32,(3,3), activation = 'relu'))
    model.add(MaxPooling2D())

    model.add(Conv2D(64,(3,3), activation = 'relu'))
    model.add(MaxPooling2D())

    model.add(Conv2D(64,(3,3), activation = 'relu'))
    model.add(MaxPooling2D())

    model.add(Flatten())
    model.add(Dense(128, activation = 'relu'))
    model.add(Dense(10, activation = 'softmax'))

    model.compile(loss = 'categorical_crossentropy', optimizer = 'adam', metrics = ['accuracy'])
    model.summary()
    model.fit(train_data, validation_data=(test_data, test_labels), epochs=10)

```

CNN IMPLEMENTATION

```

IN [4]: history = model.fit(training_data, validation_data=(test_data, test_labels), epochs=10)

Epoch 1/10
128/128 [=====] - 120s 24.074s - 100% 0.4811 - accuracy: 0.4808 - val_loss: 0.4808 - val_accuracy: 0.4798
Epoch 2/10
128/128 [=====] - 120s 23.075s - 100% 0.5078 - accuracy: 0.5074 - val_loss: 0.4851 - val_accuracy: 0.4834
Epoch 3/10
128/128 [=====] - 120s 21.073s - 100% 0.5058 - accuracy: 0.5051 - val_loss: 0.5038 - val_accuracy: 0.4978
Epoch 4/10
128/128 [=====] - 120s 24.074s - 100% 0.4903 - accuracy: 0.4904 - val_loss: 0.5342 - val_accuracy: 0.4878
Epoch 5/10

```

EPOCH CALCULATION

LITERATURE SURVEY

Saraswathi D , Naimisha U , Yukthashree, Jyothi P , Sahana G , "Human Consume Finding utilizing AI", 2018.

Execution defilement is a direct result of miss-plan of consume wounds Evaluation of the classifier results shows, that the presentation of the classifier has improved from feature extraction of GLCM and further to SVM system. It has been seen that even experts having difference of appraisal while requesting consume

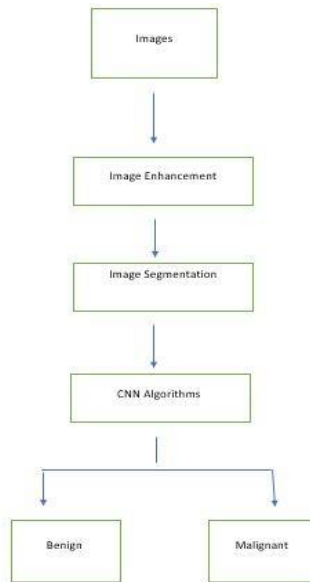

pictures. This is to be recognized, when an alternate data base like our own is created from pictures having a spot with people of different race, direction and mature under shifting encompassing light. Not a lot of papers, as referred to in reference are open on this work, specifying outcomes of those are on very certain and neighborhood informational collection of pictures got under controlled conditions. Channel models have outfitted extraordinary execution with the resource utilized.

The point was to ponder the precision of the two modalities in the examination of mid-dermal consume wounds. The results suggest that the precision of SIA is equivalent to that of LDI and SIA shows its actual limit as a commonsense and straightforward right hand in route. The chief idea behind their work is to get well consume or actedron process. Their structure uses GLCM feature extraction, K-suggests division and SVM portrayal. To choose if artificial intelligence (ML) can be used to isolate between consumed skin and run of the mill skin pictures with high accuracy. The results show obviously that machines can perform equal plan with most outrageous precision that displaced human trained professionals

RELEATED WORKS

Collect a diverse dataset of skin images, covering both benign and malignant cases. Acquire high-quality images from various sources. Augment the dataset with transformations like rotation and scaling. Normalize pixel values for consistent input. Design a Convolutional Neural Network (CNN) with layers for feature extraction. Use activation functions like ReLU for non-linearity. Include an output layer for classification. Define a loss function (e.g., cross-entropy) and an optimizer (e.g., Adam) for model training. Train the model on a pre-processed dataset, splitting it into training and validation sets. Iterate using backpropagation to update model parameters. Assess model performance on a separate test dataset using metrics like accuracy and precision. Apply a threshold to the model's output for binary classification (e.g., malignant or benign). Develop a user-friendly interface for inputting images and displaying results. Deploy the model and interface in a suitable

environment. Gather user feedback for continuous improvement. Update the model with new data to enhance its performance over time.

ARCHITECTURE DIAGRAM

CONCLUSION

They have figured out how to camouflage themselves, permitting them to stay away from our multitude of safe cells, everything being equal. Their ability to change and foster inside the general population further catches the condition, which makes it hard for experts and scientists to appreciate how to zero in on these undesirable peoples of our cells, which regardless could provoke gigantic disarrays at last. One perspective tracks down possible parallelism between developmental cycles and the start of sickness; Nonetheless, the thought needs more help. Enormous number of studies are driven reliably with new disclosures and game plans of the ailment moving our ongoing data about the infection. In any case, the sickness is at this point creating with an extended speed and turns out to be the primary wellspring of mortality in many made countries. Notwithstanding acquiring colossal data on the etiology, causes, and effects of harmful development inside the body, unfortunately, we would never have actually figured out an over-the-top number of systems to

check the affliction condition and give genuine mitigation to the patients encountering this one of the most troublesome puzzles of the clinical sciences.

FUTURE WORK

CNN-based approach has been proposed to distinguish skin sickness using pictures. It is clearly illustrated that the strategy can actually get features of skin threatening development by using the equivalent convolution the part or typical for skin infection through utilizing equivalent convolution blocks. we feel that new results will ideally overcome academic difficulties in perceiving further examples of skin harmful development and using them to test for skin cases in man-made brainpower-based structures, especially in clinical practice. Moreover, the skin illness gathering cycle not completely settled under weakness by using refined procedure like Conviction Rule Based Expert Systems (BRBES) in a planned structure. malignant growth cells are a kind of parasitic people of our own cells that lives in our body, utilizing the sustenance and supplementation of normal cells. They know how to assume command over the metabolic pathways and utilize the tissue microenvironment to develop, eat, and progress.

ABSTRACT

In recent years there is heavy demand in healthcare systems due to pandemic and Lung infections are one of the serious medical conditions that affect the life of common man. So Chest X-Rays (CXRs) and Lung Sounds are widely used for diagnosing abnormalities in the lung area. Timely diagnosis of lung diseases like tuberculosis, pneumonia, lung cancer, covid-19 etc. is very essential. Chest X-ray and Lung sounds are one among the most frequently used diagnostic tools in detecting different lung diseases as it is very common and cost effective. Disease Classification from the Chest X-rays and Lung Sounds is a demanding task for radiologists and pulmonologists. Computer-Aided Diagnosis (CAD) systems assist doctors to make quantitative analysis from Chest X-rays and Lung Sounds in identifying underlying diseases. However the performance of these systems in making conclusions on the disease type from an X-ray and Lung Sound could further be improved for achieving best diagnostic accuracy. The non-availability of enough number of skilled radiologists make the situation more worse. The goal of the project is to resolve the problem using Machine learning and Deep Learning based algorithms and it may be

well suited for early diagnosis of various lung problems, from the available chest X-ray image and Lung sounds could produce coherent results and also the proposed project provides the precautionary measures to prevent the Lung infections. Thus Chest X-ray images along with Lung Sounds and strong algorithms have the potential to quantify the severity of lung diseases. Hence the proposed project work aims in identify the lung disease using Machine learning and Deep Learning approaches and to provide precautionary measures to prevent the further Lung infections to the patient.

INTRODUCTION

A good health care system is important which ensures strong economy and it is one of the fastest growing sectors. Technology has been developed with lot more services to rural as well as urban in contributing to the economic growth of region. Covid-19 has affected worldwide, which is respiratory syndrome. So contribution to the great problem of suffering helps to overcome difficulties of respiratory problems and also makes successful treatment of a diseased person. Hence, public health studies have more importance for the research field of pulmonology in today's world. Some of the respiratory diseases namely Tuberculosis (TB), Asthma, Chronic Obstructive Pulmonary Disease (COPD), Pneumonia, Upper Respiratory Tract Infection, Covid-19 etc. are affecting the human respiratory system. The infection to the lungs is very badly affects and may leads to a death of a person. Early diagnosis of these pulmonary diseases helps to save life of people and leads to successful treatment.

Respiratory system is important to a person to breath air in and out of the lungs. It involves organs and other parts of a body for breathing. The main parts of the lung are right bronchus, left bronchus, right lung, left lung, and trachea as shown in figure 1. Trachea manages the inhaled air into the lungs using its tubular branches called bronchi. This bronchus is divided into left bronchus and right bronchus then these bronchioles ends in group of microscopic air sacs called alveoli. The main

function of the lungs is to exhale carbon dioxide and inhale oxygen. Damage to the any parts of the lungs leads to pulmonary diseases, which leads to the improper function of the lungs. Asthma gets affected due to bad weather, some foods, dry air etc. Common symptoms of asthma are trouble sleeping which is caused by coughing, chest tightness, shortness of breath etc. COPD gets affected due to second hand smoke, dust, long-term exposure to air pollution. Common symptoms of COPD are chronic cough, wheezing and shortness of breath. Bronchiectasis is caused by asthma, severe pneumonia infection, tuberculosis, fungal infections etc. Common symptoms of Bronchiectasis are joint pains, coughing up blood, shortness of breath, wheezing.

Among all the respiratory diseases pneumonia and tuberculosis affects to the air sacs of lungs known as alveoli. Common symptoms of pneumonia are confusion, fever, shaking chills, sweating, vomiting etc. Common symptoms of TB are coughing up blood or mucus, coughing for more than three weeks, fever, night sweats, chills etc. People infected with pneumonia, who have direct contacting with TB infected person leads to pulmonary pneumonia tuberculosis. Both diseases affect the lungs very badly which may leads to the death of a person. To overcome the difficulty which occurs due to respiratory infections, it is to diagnose as early as possible for the successful treatment and health life. In the proposed work Pneumonia and Tuberculosis diseases are classified using Chest X-ray and Asthma, COPD, Bronchiectasis, URTI and Pneumonia also healthy lung are classified using Lung Sound. For the classification of diseases, two different datasets are used which are collected from kaggle and chest X -ray dataset is divided into 8:1:1, 6:3:1 and 7:2: 1 for the experimentation.

The main contribution of work is to classify the diseases within seconds and also to avoid the spreading of the diseases, which may leads to further infections. Using deep learning methods such as CNN and transfer learning helps to diagnose and classify the diseases.

To diagnose and detect pulmonary diseases, lung sound and X-rays play a significant role in pulmonary pathology. Radiologists mainly deal with X-ray of lung for the identification of pulmonary diseases, they make take one day to classify the lung diseases but using non clinical methods helps to classify the diseases within seconds. Other tests for the diagnosis of pulmonary diseases are lung volume test, gas diffusion test, spirometry and excess stress test.

Lung sounds are classified as healthy lung sound or diseased lung sound. Healthy lung sound represents no infection in the lung sound exists and diseased lung sound represents when there is a infection in the lung sound exists. Abnormal lung sound is a supplementary respiratory sound that is heard in addition to the normal lung sound. The person who is infected with any of the pulmonary diseases has variation in there lung sound which means, if the lung sound is continuous then it is called as wheezes and if it is discontinuous then it is called as crackles.

Deep learning has great importance in the field of X-ray image classification and lung sound classification, especially in the field of medical, deep learning plays a significant role. Deep learning-based image classification and lung sound classification has been set up as a strong instrument in medical image lung sound classification.

Machine learning has a sub field called deep learning, it is currently used in most common image recognition systems or tools. One of the main advantages is that it works well with unstructured data. Within deep learning, CNN is type of ANN, which is mainly used for image classification.

One of the machine learning techniques called transfer learning where trained model knowledge will be applied to the new task and solves the task. Some of the transfer learning models which are used to classify the images are mobileNetV2, VGG16, VGG19, Inception-v3, and Resnet etc.

In the proposed work mobilenetV2 and two CNN models are used for the lung disease classification. CNN1 is without batch normalization and dropout layers.

CNN2 model is trained with additional layers such as dropout and batch normalization to enhance the model performance. Using chest X ray mobilenetV2 gave the best results compared to CNN1 and CNN2 and achieved 97% of accuracy using mobilenetV2 model. Thus Chest X-ray images and lung sound along with strong algorithms have the potential to quantify the severity of lung disease as well as to classify the pulmonary diseases.

LITERATURE REVIEW

Naman Gupta et al., [1] “Evolutionary algorithms for automatic lung disease detection”. Authors focused on two types of pulmonary diseases such as COPD and fibrosis. COPD makes breathing difficult for taking oxygen in and out of the lungs. Pulmonary fibrosis is a pulmonary disease which will do the scarring of lung tissue. To classify these diseases, authors used four machine learning classifiers such as Decision Tree, Support Vector Machine, K-Nearest Neighbor, and Random Forest. Achieved accuracy more than 90%. **Abdelbaki Souid et al., [2]** “Classification and Predictions of Lung Diseases from Chest X-rays Using MobileNet V2”. Authors proposed that transfer learning models gives the best results and used MobilenetV2

model for the classification of chest X-ray. Explained about classification of diseases using deep learning techniques such as RCNN and CNN.. Multiclass classification is done on pulmonary diseases such as Effusion, Edema, Emphysema, Hernia, Infiltration, Fibrosis, Nodule, Mass, Pneumonia, Pleural Thickening. And achieved accuracy above 90%, average AUC of 0.811. The proposed work can also implement on smaller IOT devices. **Rahib H. Abiyev, Abdullahi Ismail [3]** “COVID-19 and Pneumonia Diagnosis in X-Ray Images Using Convolutional Neural Networks”. Authors proposed two CNN models for two different sets of dataset. One CNN model trained on one dataset and another model trained on another dataset using chest X-ray. Classified the covid-19, Pneumonia and normal lung. There are two classifications done on the dataset such as binary and multi class classification. Achieved good precision, Recall and F1 score with values 98.3%, 97.9%, 98.3%, and 98.0%. **Luca Brunese et al., [4]** “Explainable Deep Learning for Pulmonary Disease and Corona virus COVID-19 Detection from X-rays”. To differentiate between Covid-19 and Pneumonia, authors used deep learning techniques in the proposed work. This work was done in three phases. The first is to detect X-ray image in which it contains Pneumonia. The second is to differentiate between Covid-19 and Pneumonia. Third is to locate the chest X-ray image of Covid-19 presence. Used VGG-16 model for lung diseases classification and achieved an average accuracy of 0.97%. **Stefanus Tao Hwa Kieu et al., [5]** “A Survey of Deep Learning for Lung Disease Detection on Medical Images: State-of-the-Art, Taxonomy, Issues and Future Directions”. Authors proposed the survey on trends of recent work and identifying the issues for future work. Authors also mentioned about different types of techniques and different pulmonary diseases using Chest-X ray and CT scan images. **Stefanus Kieu Tao Hwa et al., [6]** “Ensemble deep learning for tuberculosis detection using chest X-Ray and canny edge detected images”. Authors used deep Learning Techniques for the avoidance of misclassification between TB and Lung Cancer. There Are two sets of features are extracted for the pulmonary disease

classification. First set of features were extracted from the original X-ray images. And Second set of features were extracted from the edge detected images. Proposed ensemble method gave the best results of accuracy 89.77%, specificity of 88.64% and sensitivity of 90.91%. **Subrato Bharati et al., [7]** “Hybrid deep learning for detecting lung diseases from X-ray images”. Authors proposed pulmonary disease identification based on chest X-ray using different forms of deep learning techniques such as vanilla neural network, VGG network, and capsule network are used for lung disease prediction. Authors used new hybrid deep learning framework by fusing VGG, spatial transform network, data augmentation with CNN. And achieved test accuracy around 73%. The proposed work helps to identify the pulmonary diseases for doctors as well as experts. **Geraldo Luis Bezerra Ramalho et al., [8]** “Lung disease detection using feature extraction and extreme learning machine”. Authors proposed the identification of COPD and fibrosis using CT scan images. Adaptive crisp active contour model is used for lung segmentation. Classified the two types of lungs such as normal and diseased lung. The proposed model achieved 96% accuracy in identification of normal and diseased lungs. **Matthew Zak and Adam Krzyżak [9]** “Classification of Lung Diseases Using Deep Learning Models”. Using small volume of data, identification of pulmonary disease is proposed. Three convolutional deep neural networks are used namely ResNet-50, VGG16 and InceptionV3. Compared the performance of models with existing ones. InceptionV3model gave the best results compared to other. **Rachna Jain et al., [10]** “Pneumonia detection in chest X-ray images using convolutional neural networks and transfer learning”. Authors proposed work based on identification of pneumonia in children using CNN with help of chest X-ray and classified disease as pneumonia and non-pneumonia by changing the convolution neural network, parameters and hyper parameters. The first two models consist of two and three convolution layers and the rest models are pre-trained models. Achieved accuracy greater than 80%. **Shimpy Goyal et al., [11]** “Detection and classification of lung

diseases for pneumonia and Covid19 using machine and deep learning techniques". Authors proposed work on differentiating between covid-19 and pneumonia with the help of chest-X ray. Soft computing methods such as ANN, K-nearest neighbour, Support Vector Machine, Deep Learning classifiers and Ensemble Classifiers are used for pulmonary disease classification. Using Recurrent Neural Network accurate prediction is achieved. **Xiaosong Wang et al., [12]** "TieNet: Text-Image Embedding Network for Common Thorax Disease Classification and Reporting in Chest X-rays". In the proposed work, authors explained the importance of professional training and also the knowledge accumulation due to the lack of techniques and high-level reasoning of human radiologists. To resolve the problem, authors transformed the Tie Net into a X-ray reporting system. And also used Text-Image Embedding Network for extracting the text representation. Achieved the accuracy over 90%. **Asmaa Abbas et al., [13]** "Classification of COVID-19 in chest X-ray images using DeTraC deep convolutional neural network". Authors explained that CNN has achieved greater success in classification of diseases using lung X-rays and also said that transfer learning is the best suitable method for the pulmonary disease classification. Used Deep CNN, called Decompose, Transfer and Compose (DeTrac), for the classification of covid-19 X ray images. Achieved accuracy 93.1% in identifying covid-19 disease and respiratory syndrome cases using DeTrac method. **Muazzez Buket DARICI et al., [14]** "Pneumonia Detection and Classification Using Deep Learning on Chest X-Ray Images". Authors proposed classification of bacterial pneumonia, viral pneumonia and also healthy lung in children under the age of 5. Synthetic Minority Over-sampling technique is used to deal with imbalanced dataset. CNN and Ensemble learning is used for the multiclass classification as well as binary classification. Achieved 78% accuracy in binary class classification and 75% average accuracy was achieved by multi class classification. **Dina M. Ibrahim et al., [15]** "Deep-chest: Multi-classification deep learning model for diagnosing COVID-19, pneumonia, and lung cancer chest diseases". Authors proposed work on

classification of covid-19, pneumonia and lung cancer chest diseases using CT scan images and chest X-ray images. Addressed the problem of covid-19 and pneumonia or lung cancer are mimic each other and they are mistakenly diagnosed. Used two testing methods such as chest X-ray and CT scan images. Therefore, lungs X-ray is less efficient in the early stages while CT scan images are more useful before symptoms appear. Used transfer learning models to classify the lung diseases and achieved greater than 90% accuracy. **Mohd Nizam Saad et al., [16]** “multiclass classification for chest x-ray images based on lesion location in lung zones”. Authors proposed innovation in radiology technology and used chest X-ray images to find problems in lungs such as lesion through scanning process in lung area which is divided into 6 zones. Used support vector machine to classify the zones and achieved greater than 90% accuracy. **Mahmoud Ragab et al., [17]** “Multiclass Classification of Chest X-Ray Images for the Prediction of COVID-19 Using Capsule Network”. Classification of normal, pneumonia and covid-19 is proposed in this work and total 6310 chest X-ray images are used for training the model. Capsule Network is used to for the multi class classification and compared the performance with classic CNN models. The proposed work achieved accuracy greater than 95% during the models training. **Mugahed A. Al-antari et al., [18]** “Fast deep learning computer-aided diagnosis of COVID-19 based on digital chest x-ray images”. Authors proposed the work on identification of covid-19 with the help of digital chest X-ray images and designed computer aided system based on YOLO predictor. Not only diagnosis of covid-19 was done but also differentiating it from eight other diseases. The proposed work achieved accuracy of 97% and 96%. Initially system was trained with 50,490 X-ray images and it is able to diagnose the diseases of single chest X-ray images and which is very helpful for the healthcare systems, physicians etc. **Mohammad Hesam Hesamian et al., [19]** “Deep Learning Techniques for Medical Image Segmentation: Achievements and Challenges”. Deep learning is proposed as robust tool in image segmentation. The proposed work explains about various deep learning techniques

for medical image segmentation. Addressed the most common problems and provided the solutions. **Sungyeup Kim et al. [20]** “Deep Learning in Multi-Class Lung Diseases’ Classification on Chest X-ray Images”. Authors proposed deep learning method for multi class classification with the help of raw chest X-ray images which are directly inputted into a deep learning method. Experimented on three class classification such as normal, pneumonia and pneumothorax. Used transfer learning models to classify the diseases and achieved accuracy greater than 80%. **Sergio Varela-Santos, Patricia Melin [21]** “A new modular neural network approach with fuzzy response integration for lung disease classification based on multiple objective feature optimizations in chest X-ray images”. Diagnosis of pneumonia and lung nodule is proposed using digitalized chest X-ray images. Authors focused on classification based on descriptors such as, gray level co-occurrence matrix (GLCM), grayscale histogram features, texture based features, local binary pattern texture features. Used optimized neuro-fuzzy classifier to classify the diseases present in the chest-X ray. The proposed work achieved high accuracy. **F. M. Javed Mehedi Shamrat et al., [22]** “LungNet22: A Fine-Tuned Model for Multiclass Classification and Prediction of Lung Disease Using X-ray Images”. CNN model is proposed for multi-class classification of chest X-ray images. A total of 80,000 chest X-ray images are used for the model classification. Eight pre trained CNN models are used such as InceptionV3, MobilenetV2, GoogleNet, AlexNet, VGG16, ResNet50, DenseNet121, AlexNet and EfficientNetB7. Among these VGG16 has achieved highest accuracy at 92.95%. **Rudrajit Choudhuri and Amit Paul [23]** “Multi Class Image Classification for Detection of Diseases Using Chest X Ray Images”. Authors proposed multiclass classification of pulmonary diseases using chest X-ray images. CNN, Transfer Learning, VGG16 are used to classify Pneumonia and Covid-19 diseases. Algorithms achieved 98% accuracy, which is used for the fast and preliminary test for the detection of pulmonary diseases. **Thi kieu khanh ho and Jeonghwan gwak [24]** “Utilizing Knowledge Distillation in Deep Learning for

Classification of Chest X-Ray Abnormalities". For pulmonary disease identification, authors explained about the recent trending technology for the proposed work. The trending technologies are computer vision and medical image communities, presented a knowledge distribution in deep learning for classification of diseases. A self-training KD framework, which is the model learned from itself. Achieved better accuracies compared to the other state of art work. **Daniel Chamberlain et al., [25]** "Application of Semi-Supervised Deep Learning to Lung Sound Analysis". Very less research has been done using lung sounds, authors proposed semi-supervised deep learning algorithms for classification of lung sounds with large number, which is larger than the previous research work. Achieved AUCs of 86% and 74% for crackle. This study is conducted using larger datasets of sound, which is not done previously. **Fatih demir et al., [26]** "Classification of Lung Sounds with CNN Model Using Parallel Pooling Structure". Pulmonary sounds are collected using electronic stethoscopes for early diagnosis. CNN is used for the extraction of deep features. In CNN model average pooling layer and max pooling are combined to boost classification performance. Deep features are utilized as the input of Random Subspace Sampling (RSS) and Linear Discriminant Analysis (LDA). The proposed methods are evaluated against ICBHI 2017 dataset and deep features of RSS, LDA gave the best accuracy when compared to other existing methods. **Arati Gurung et al., [27]** "Computerized lung sound analysis as diagnostic aid for the detection of abnormal lung sounds: A systematic review and meta-analysis". To identify the respiratory disorders, electronic stethoscope is used to resolve the problems. Neural network and Fourier Transform algorithms are used for analysis and automated classification of lung sounds. And achieved accuracy sensitivity accuracy was 80% and specificity was 85%. Study shows that computerized lung sound analysis provided high specificity for detecting abnormal lung sounds such as wheezes and crackles. **Shing-Yun Jung et al., [28]** "Efficiently Classifying Lung Sounds through Depthwise Separable CNN Models with Fused STFT and MFCC Features". The

proposed work used the Depthwise-seperable convolution neural network to classify the pulmonary diseases, the Short-Time Fourier Transfor(STFT) feature , Mel –Frequency Cepstrum coefficient feature and fused feature of these two are used for classification of lung sound. The models achieved accuracy of 82% and 73%, fused features achieved accuracy of 85%. **M. Fraiwan et al., [29]** “Recognition of pulmonary diseases from lung sounds using convolutional neural networks and long short-term memory”. The study shows about the classification of pulmonary diseases using electronically recorded pulmonary sounds. All sound recordings were examined to have sampling frequency of 4 kHz and segmented into 5s segments. To ensure less noisy and smoother signals, lot of preprocessing steps are undertaken .Used deep learning networks for the classification such as CNN and Bi-directional short-term memory units. The developed algorithm achieved accuracy of 99%, further a total 98% was obtained between original classes and predictions within the training scheme. **Arpan Srivastava et al., [30]** “Deep learning based respiratory sound analysis for detection of chronic obstructive pulmonary disease”. Authors explained about the importance of machine learning and deep learning techniques in classification of pulmonary diseases and explained about the impact of respiratory diseases apart from critical health diseases such as cancer and diabetes. The study experimented on the COPD detection using deep convolution neural network technologies. The system could also be able to classify the disease as mild, moderate or acute. The system classification achieved the accuracy of 93%. **Yoonjoo Kim et al., [31]** “Respiratory sound classification for crackles, wheezes, and rhonchi in the clinical field using deep learning”. Authors explained about providing first aid and diagnosing respiratory diseases is important. To overcome such difficulties, respiratory sound classification is developed.Used deep learning convolutional neural network to classify the 1918 respiratory sounds, such as Crackles, Wheezes and Rhonchi. The proposed system achieved accuracy of 86% and ROC curve of 93%. It is further classified the respiratory sounds as normal and abnormal with an

accuracy of 85%. The proposed work helps to classify the respiratory disorders and appropriate treatment of pulmonary diseases.

PROBLEM STATEMENT

Proposed system is designed to classify the pulmonary diseases such as Tuberculosis, Pneumonia, Normal, COPD, Bronchiectasis, Asthma, Pulmonary Fibrosis, and Covid-19 etc. non clinical methods such as machine learning and deep learning techniques plays a vital role in classification of pulmonary diseases. In this work, classification and prediction of pulmonary diseases using Transfer learning and CNN is proposed. The experimentation is performed by using Lung Sound database and Chest X-ray Database for the classification of pulmonary diseases, further also identify the normal lung. The proposed work is faster and employs multi-class classifier viz. transfer learning and CNN for the lung diseases classification. The MobilenetV2 transfer learning technique outperforms than convolutional neural networks.

EXISTING SYSTEM

Lung Sound and Chest X-ray

Lungs X-ray is the majorly used medical imaging technique for the classification of pulmonary diseases and also which is the most easily available dataset compared to CT scan images. The dataset is a combination of normal, pneumonia and tuberculosis chest X-ray which is collected from kaggle. Chest X-ray samples are shown in Fig 3.1 There were few individuals available for the three classes. And merged the dataset of all the three classes for the proposed work. The first dataset contains normal and pneumonia chest X-ray samples and there were 5528 X-ray images and in two categories (Pneumonia/normal) which are in JPEG file format. The training data contains 3869 images, 2991 represents pneumonia, 878 are normal. The test data contains 1659 images, 1282 represents pneumonia, 377 images are normal. The second dataset contains 700 tuberculosis chest X-ray images and all

the images are in PNG file format. These two datasets are merged to make all in one for the proposed work.

Table 1. Shows the Number of chest X-ray samples.

Classes	Train Samples	Test Samples	Validation
Sample			
Normal	878	377	8
Pneumonia	2991	1282	8
Tuberculosis	700	700	8
Total	4569	2359	24

The sound of the normal lung is comparable to that of the air, whereas the sound of the diseased lung contains crackles, wheezes, and rhonchi. The pulmonary disorders are brought on by the discovery of such aberrant lung sounds. While wheezes and crackles are intermittent sounds, rhonchi sounds are continuous sounds that are cleansed by coughing. However, categorizing abnormal lung sounds is a crucial endeavour, and among all the abnormal noises, crackles, wheezes, and rhonchi are the most frequently heard. Figure 3.2 displays the signals related to distinct lung sounds.

PROPOSED SYSTEM

Block Diagram

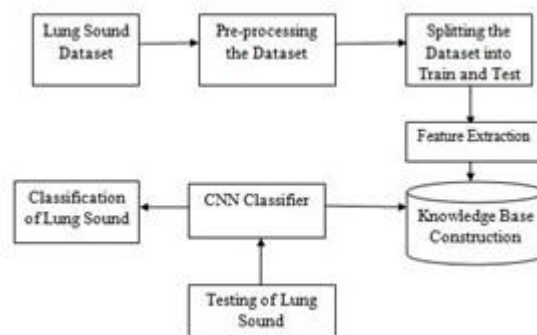

A block diagram is a model of a mechanism for which the major elements or services are illustrated by modules interconnected that depict the linkages between all the elements. As shown in figure 3.3, composites are widely utilized in engineering for the development of hardware, electrical design, software design, and process flow diagramming.

Block Diagram of Chest X-ray.

The dataset is a combination of normal, pneumonia and tuberculosis chest X-ray which is collected from hagggle. There were few individuals available for the three classes. And merged the dataset of all the three classes for the proposed work. Chest X-ray is the commonly used medical imaging technique for the diagnosis of pulmonary diseases and it is the most common test to reveal conditions of lungs inside the body. During the treatment of a patient effective and correct diagnosis of the diseases is needed which is based on information obtained from the medical images.

Total three sets of data are prepared for the experimentation which are in the ratio of 7:2:1, 8:1:1 and 6:3:1 and it is very huge while preparing the dataset and all are divided into train, test and validation for the classification. After preparation of the dataset, pre-processing techniques are applied for the classification of pulmonary diseases. Data pre-processing is nothing but conversion of the raw data for the classification of diseases to get better prediction and accuracy. This includes resizing of the images, eliminating of unwanted images, normalization etc. To get better model prediction. Table 1. Shows total number of images which are collected from kaggle.

Block Diagram of Lung Sound.

Lung sound Dataset consists of 226 sound recordings which are recorded from digital stethoscope and sound recording techniques. It consists of total 6 diseases such as Bronchiectasis, Asthma, COPD, Healthy, Pneumonia, URTI (Upper Respiratory Tract Infection). Initial step was pre-processing of the dataset, which

includes extracting of all the sound features, displaying of all the features extracting from each sound. After that splitting the dataset into train and test for the execution of model. Based on the knowledge obtained from the pre-processing, CNN model is applied and analysed the results obtained from the model. The block diagram of lung sound is shown in figure 3.4 totally 1000 epochs were run on the model to get better accuracy and classification. Final step contains the model classification were the model is able to classify all the sounds which were given for training and testing.

METHODOLOGIES

Algorithm

CNN1

Begin

Step 1: Read the Dataset

Step 2: Pre-processing of the Dataset

Step 3: Apply the CNN1 Model

Step 4: Analyse the performance of model with classification report.

Step 5: Classification of Diseases.

End.

The CNN1 model is applied for both Chest X-ray as well as Lung Sound Dataset. For chest X-ray dataset, model performance is not good as compared to other models but for lung sound dataset, the model outperforms and able to classify all the diseases which were given as input..

CNN2

Begin

Step 1: Read the Dataset

Step 2: Preprocessing of the Dataset

Step 3: Apply the CNN2 Model

Step 4: Analyze the performance of model with classification report.

Step 5: Classification of Diseases.

End

The CNN2 model is applied for Chest X-ray dataset. Where batch normalization and drop out layers are applied to enhance the performance of previous model. So the model performance got improved after applying the two layers. The system is able to classify the diseases.

MobileNetV2

Begin

Step 1: Read the Dataset

Step 2: Preprocessing of the Dataset

Step 3: Apply the MobileNetV2 Model

Step 4: Analyze the performance of model with classification report.

Step 5: Classification of Diseases.

End

Among all the models MobileNetV2 performs very well, and gave the best accuracy and results compared to other state of works. It is a pre trained model, where the model was trained for large dataset due to that reason model outperforms than other and able to classify all the diseases with less misclassification.

Train and Test Accuracy Results of Three Kinds of Datasets

Model Name	Dataset Dist.	Epoch	Train Acc.	Test Acc.
CNN1	70,20,10	5	89%	70%
CNN1	70,20,10	12	94.38%	87.24%
CNN1	70,20,10	25	96%	91%
MobileNetV2	70,20,10	5	95.47%	96.10%
MobileNetV2	70,20,10	12	97.3%	95.23%
MobileNetV2	70,20,10	25	97%	96%
CNN2	70,20,10	5	92.66%	53.74%
CNN2	70,20,10	25	80%	92%

Model Name	Dataset Dist.	Epoch	Train Acc.	Test Acc.
CNN1	80,10,10	5	92.29%	91%
CNN1	80,10,10	12	96.75%	90%
CNN1	80,10,10	25	96.63%	90.69%
MobileNetV2	80,10,10	5	95.12%	93%
MobileNetV2	80,10,10	12	96.95%	97.60%
MobileNetV2	80,10,10	25	97.66%	96.94%
CNN2	80,10,10	5	65%	24%
CNN2	80,10,10	25	89%	92.44%

Model Name	Dataset Dist.	Epoch	Train Acc.	Test Acc.
CNN1	60,30,10	5	90%	82%
CNN1	60,30,10	12	97%	81%
CNN1	60,30,10	25	97%	81%
MobileNetV2	60,30,10	5	91.47%	75%
MobileNetV2	60,30,10	12	98%	81%
MobileNetV2	60,30,10	25	98.22%	81.22%
CNN2	60,30,10	5	98%	81%
CNN2	60,30,10	12	98%	80%
CNN2	60,30,10	25	98%	94%

Model	Accuracy %
CNN1	94%
MobileNetV2	97%
CNN2	95%

CONCLUSION

A healthcare system helps to prevent diseases and gives better quality of life. Due to pandemic, whole world affected very badly. Not only using clinical methods can overcome such problems, but also using non clinical methods helps for the doctors to solve the issues or problems very easier and classify the pulmonary diseases in stipulated period of time. In the proposed work classification of pulmonary diseases using Transfer learning and CNN is proposed. The experimentation is performed by using Lung Sound and Chest X-ray database for the classification of types of diseases namely Pneumonia, Tuberculosis, COPD, Bronchiectasis, Asthma and URTI further also classify the normal lung. The proposed work is faster and employs multi-class classifier viz. transfer learning and

CNN for the lung diseases classification. The MobilenetV2 transfer learning technique outperforms than convolutional neural networks. Enhancing the identification of healthcare systems and also provide ridiculously high-quality Medicare systems, based on the results of the survey.

ABSTRACT

Rainfall has a significant effect on ecosystems, agriculture, and human life. It is necessary for the hydrological cycle on Earth. While insufficient rainfall encourages growth, excessive or sufficient rainfall provides barriers. While droughts affect crops and result in water shortages, heavy rainfall damages infrastructure and causes floods. Climate change intensifies these issues by altering rainfall patterns and intensifying extreme weather. Understanding these processes is crucial for sustainable development, water management, and disaster preparedness. This calls for usage of advanced predictive models and mitigating strategies. Developing and evaluating an accurate rainfall forecast model for a particular region is the project's aim. Historical meteorological data, such as temperature, humidity, wind speed, and air pressure, are collected and preprocessed for training the model. The prediction abilities of several ML techniques, including Random Forest, SVM, and Long Short-Term Memory (LSTM) neural networks, are compared and used in this study. Techniques for feature engineering and selection are made use to enhance model performance. The recommended models are assessed by strict cross-validation processes and compared with baseline models. The results demonstrate that the LSTM-based model performs exceptionally well in rainfall pattern forecasting, exhibiting a significant improvement in prediction accuracy over traditional methods. This research provides a thorough analysis of rainfall prediction using meteorological data and ML methods.

INTRODUCTION

Rainfall prediction is a critical aspect of meteorological exploration, with profound implications for various sectors such as agriculture, water resource management, and disaster preparedness. Accurate forecasting of precipitation enables timely decision-making and resource allocation, mitigating the impact of extreme weather events. Traditional methods of rainfall prediction often face challenges in handling the complexity and non-linearity inherent in meteorological data. Predicting rainfall has become more accurate and reliable in recent years thanks to the incorporation of ML techniques. With the capacity to identify patterns from large datasets, ML algorithms provide a flexible and dynamic method of rainfall forecasting. This paper explores the implementation of ML techniques to enhance rainfall prediction, aiming to contribute to the advancement of meteorological science and the development of more effective early warning systems. By harnessing the power of algorithms such as support vector machines, ensemble methods, and neural networks, this research seeks to overcome the constraints of traditional methods and improve the precision of rainfall predictions on both short and long-term scales. This introduction sets the stage for the subsequent sections, which delve into the specific methodologies, datasets, and results achieved through the application of ML in rainfall prediction.

LITERATURE REVIEW

Rainfall prediction is a critical aspect of meteorological exploration, with profound implications for various sectors such as agriculture, water resource management, and disaster preparedness. Accurate forecasting of precipitation enables timely decision-making and resource allocation, mitigating the impact of extreme weather events. Traditional methods of rainfall prediction often face challenges in handling the complexity and non-linearity inherent in meteorological data. Predicting rainfall has become more accurate and reliable in recent years thanks to the incorporation of ML techniques. With the capacity to identify patterns from large datasets, ML algorithms provide a flexible and dynamic method of rainfall forecasting. This paper explores the application of ML techniques to enhance rainfall prediction, aiming to contribute to the advancement of meteorological science and the development of more effective early warning systems. By harnessing the power of algorithms such as support vector machines, ensemble methods, and neural networks this research seeks to overcome the constraints of traditional methods and improve the precision of rainfall predictions on both short and long-term scales .This introduction sets the stage for the subsequent sections, which delve into the specific methodologies, datasets, and results achieved through the application of ML in rainfall prediction.

PROBLEM STATEMENT

This Research paper seeks to address prevailing limitations by developing an intricate rainfall prediction model. The main goal is to develop a thorough framework that incorporates several meteorological factors, such as temperature, humidity, wind speed, and air pressure. Using state-of-the-art data processing tools, this synthesis aims to develop a dependable rainfall prediction model by merging information from several sources. Bringing these complex factors together into a coherent system that can predict rainfall events with accuracy is the main problem. The research seeks to overcome this obstacle in order to greatly improve the

precision of rainfall forecasts, both short- and long-term. Such forecasting accuracy has the potential to completely transform the way important industries like agriculture, water resource management, and disaster preparedness make decisions. Better forecasting skills provide stakeholders the insight they need to plan ahead and take proactive measures with respect to different rainfall events. The implementation of this model is expected to yield essential insights for the planning of agricultural operations, the optimal distribution of water resources, and preventative measures against future calamities caused by extreme rainfall events. In the end, if the project is successful, it may bring about a new era of knowledgeable decision-making that promotes adaptability and readiness to deal with unpredictable and changing rainfall patterns.

EXISTING SYSTEM

Machine Learning-Based Models:

IEEE papers often analyze the execution of ML algorithms such as Support Vector Machine (SVM), Gradient Boosting Machines (GBM), Artificial Neural Networks (ANN), neural networks, and Convolutional Neural Networks (CNN) and also the deep learning architectures like LSTM networks and CNN. These models use historical meteorological data to forecast patterns of rainfall.

Hybrid Models:

A few research suggest hybrid models that blend ML algorithms along with statistical methods. These hybrids seek to improve prediction accuracy by leveraging the advantage of both strategies.

Ensemble Methods:

IEEE publications often investigate ensemble techniques, such as combining numerous models or forecasts. This method contributes to lowering prediction uncertainty and raising the general precision of rainfall forecasts.

Remote Sensing and GIS integration:

More inclusive and spatially accurate rainfall predictions are produced, especially in local or regional contexts, when geographic information systems (GIS), remote sensing data, satellite imagery, and spatial analytic approaches are combined.

Big Data and IoT-Based Methods:

The application of Big Data technologies to Internet of Things (IoT) devices for real-time data processing and collecting is explored in several IEEE articles. These systems work to improve the timeliness and accuracy of rainfall forecasts by continuously updating and analyzing data sources.

Techniques for Feature Engineering and Selection:

There are several of studies which concentrate on enhancing feature engineering and selection processes to pinpoint the most pertinent meteorological factors that have a major influence on rainfall forecast. Researchers are always working to improve these systems and algorithms in view of predicting rainfall more accurately, robustly, and timely for variety of uses, such as environmental conservation, disaster management, agriculture, and water resource planning.

PROPOSED SYSTEM

Random Forest:

An accurate and potent regression model is Random Forest Regression. It typically does well on a wide range of issues, particularly those involving characteristics with non-linear relationships. An algorithm for supervised ML that makes advantage of ensemble learning is called random forest regression. Regression technique. During the training phase, RF builds multiple decision trees, with the mean of the classes serving as each tree's forecast. The following steps are how the (RF)Random forest algorithm operates:

Randomly selecting subsets of data points for diversity

Building decision trees on these subsets. c. Repeating the process for creating an ensemble of decision trees.

Aggregating predictions for a new data point by averaging results from all trees.

XGBoost gradient descent:

eXtreme Gradient Boosting, or XGBoost, is a specialized version of the Gradient Boosting technique that finds the optimal tree model by utilizing more precise approximations. To forecast a target variable, y_i , supervised ML with data including numerous aspects of x_i is implemented using XGBoost. Because of the algorithm's speed and prediction accuracy, XGBoost is frequently used by writers to solve various regression and classification issues. Extreme Gradient Boosting (XGBoost) is also considered as one of the efficient [19] gradient gradient descant techniques that combines a linear model approach and a tree learning algorithm. It is quicker than alternative gradient descent methods since it is computed concurrently on a single processor. The XGBoosting algorithm is selected in this paper's trials to forecast the utilizing a variety of input or dependant environmental variables, the objective variable is the daily intensity of rainfall. XGBoost is a potent algorithm that uses distributed and parallel computing to learn quickly and efficiently. It also provides solid solutions with efficient memory use.

Support vector machine:

Weather forecasting still makes use of the job forecast model's estimated memory and accumulated experience based on various weather kinds. The process of developing forecasting knowledge takes time, and defining forecasting information is challenging because of the complexity and nonlinearity of climate evolution. Any climate or meteorological variable evolves as a outcome of the conditional combinations of certain meteorological elements, and these combinations are diverse and intricate. With advancements in computer technology and smart machines, sophisticated machine recognition skills have been well-developed to express complicated nonlinear correlations between meteorological elements in existing time

and space. SVM is frequently utilized for several machine learning issues. The primary multi-layer feed-forward network classification is found in SVM. Support vector machines, like multi-layer perceptrons and radial function networks, are employed in non-linear regression and pattern recognition. The SVM is employed to carry out the subsequent tasks. Superior generalization potential in comparison to other neural network models; identical, efficient, and absent from local minima; utilized for non-vectorial data. This approach is only employed by a small number of scientists to forecast rainfall, and the outcomes are acknowledged.

LST:

The significance of Land Surface Temperature (LST) in enhancing rainfall prediction model accuracy has grown. Insights into the application of LST in a predictive algorithm for improved rainfall forecasting are given in this section. One important meteorological characteristic that significantly affects atmospheric processes is LST. Technologies for remote sensing, especially satellite-based observations, provide a path to measure LST at different temporal and spatial scales. In order to create more reliable and accurate prediction models, it is imperative to comprehend the link between rainfall and LST. LST is an important component of ML algorithms. Using the LST data, algorithms like Random Forest, Neural Networks and Support Vector Machines may utilize temperature trends to forecast rainfall. The model's capacity to represent intricate interactions among meteorological datasets is improved with the addition of LST. The algorithm follows few steps, including selection of relevant features, model training, and validation. Random Forest Regression, a widely preferred ensemble learning method, is employed for its capability to handle non-linear relationships and manage large datasets efficiently. The algorithm is trained on historical data, with LST acting as a key predictor for rainfall.

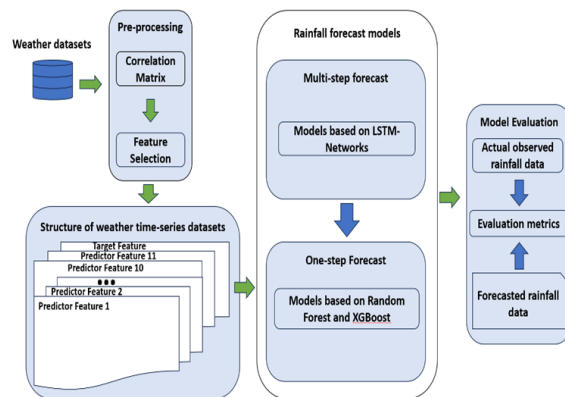

Fig.2 Block Diagram of Proposed Work

METHODOLOGIES

Data collection:

Raw data which is collected from meteorological station is used as input for the machine learning algorithms to predict rainfall intensity.

Performance measurement:

The performance of the ML algorithms was measured using RMSE (Root Mean Square Error) and MAE (Mean Absolute Error). These metrics are used for evaluating the accuracy and effectiveness of the algorithms in predicting rainfall.

Selection of relevant features:

The research paper identified the relevant features of environmental variables that can be used to predict daily rainfall intensity. This selection was based on Pearson coefficient ranges and other criteria determined during the analysis.

Comparison of algorithms:

Compare the performance of different machine learning algorithms.

Importance of atmospheric features:

Previous research identified important atmospheric features such as solar radiation, perceptible water vapor, and diurnal features for daily rainfall prediction. The research paper aimed to study the impact of using different atmospheric features and a larger dataset.

CONCLUSION

Through comprehensive analysis and validation, our approach demonstrates promising results, paving the path for improved accuracy in rainfall prediction. The integration of ML techniques not only enhances forecasting precision but also contributes to proactive risk management in various sectors reliant on weather predictions. As we continue to refine and expand these models, the potential for mitigating the impact of unpredictable rainfall events becomes increasingly tangible, offering valuable insights for decision-makers and stakeholders in diverse fields.

ABSTRACT

In the modern era, convenience and efficiency have become essential aspects of daily life, and grocery shopping is no exception. The traditional shopping experience, characterized by long queues and time-consuming checkout processes, can be frustrating and inefficient. To address these challenges, the Tech Trolley has emerged as an innovative solution, leveraging Bluetooth and RFID technology to revolutionize the grocery shopping experience. The Techrolley seamlessly integrates RFID tags attached to grocery items with an RFID reader embedded within the trolley itself. As items are placed in the trolley, the RFID reader identifies and captures their unique product codes. Our objective is to create an automated mobile trolley equipped with intelligent shopping functionalities to address the stated issue. The design of our technological shopping trolley centres around a four-wheeled mobile robot. This document outlines the hardware and software architecture of our smart trolley system. Utilizing ESP32 and an Android smartphone as sensors and controllers, our technological trolley embodies advanced capabilities. Android smartphone will control the trolley by sending a signal to ESP32 paired with Bluetooth chip and also show the items placed in the trolley.

INTRODUCTION

The retail sector, along with various other industries, has undergone significant transformations due to technological advancements. Among these, Radio Frequency Identification (RFID) and Bluetooth applications stand out, revolutionizing the shopping experience. One innovative solution poised to enhance both inventory management for merchants and customer shopping experiences is the smart trolley, which integrates RFID and Bluetooth technologies. RFID technology enables the automatic identification and tracking of products or objects placed in a shopping trolley by affixing RFID tags to each product and mounting an RFID reader on the cart. This allows for automatic scanning of items and creation of a shopping list. The Bluetooth application, paired with a Bluetooth chip connected to an ESP 32, facilitates communication with a motor driver, which in turn controls the movement of the trolley. Therefore, this paper aims to explore the benefits, challenges, and future prospects of smart trolleys utilizing Bluetooth applications and RFID technology. It will delve into the technical intricacies of the system, its impact on the retail sector, and its potential to shape future consumer purchasing behavior. The research outcomes will contribute to the existing body of literature on Bluetooth and RFID technology and their applications in the retail industry.

LITERATURE REVIEW

In today's rapidly growing world, characterized by a diverse population with varying needs across different domains, consumers frequenting shopping malls or grocery stores often face challenges in coordinating their purchases efficiently, requiring significant time and patience. Addressing these issues necessitates leveraging technology effectively. Emerging advancements in shopping offer

promising solutions that are both reliable and cost-effective. In this context, various approaches in smart shopping have been proposed and are under examination. Prateek Aryan et.al.[1] proposed Smart Shopping Cart with Automatic Billing System through RFID and Bluetooth. In this framework, each shopping basket is embedded with a Product Identification Device (PID) that contains the Bluetooth module, EEPROM, RFID reader, LCD and microcontroller.

Udita Gangwal et.al.[2] proposed Smart Shopping Cart for Automated Billing Reason utilizing Wireless Sensor Networks. In this paper, they depict the usage of a dependable, reasonable and cost-productive smart shopping cart utilizing remote sensor networks. Such a framework is appropriate for stores, where it can help instore labors and clients.

Sudhir Rao Rupanagudi et.al.[3] proposed A Novel Video Processing based Cost-Effective Savvy Trolley System for Supermarkets utilizing FPGA. This portrays a novel practical strategy to defeat issue likes inability to locate items by connecting a web camera.

Suganya.R et.al. [4] represented Automated Smart Trolley with Smart Billing Using Arduino. This system based on RFID detection and Bluetooth.

PROBLEM DEFINITION

The retail industry is facing significant challenges, including evolving customer preferences for convenient and personalized shopping experiences. Traditional shopping methods involve manual product selection, cumbersome checkout processes, and often result in customers spending excessive time navigating stores. Inefficiencies in inventory management and a lack of real-time data analytics tools also hinder the ability of retailers to optimize their operations. These issues highlight the need for a solution that can streamline the shopping process, enhance customer satisfaction, and improve retail operations. The “Tech-trolley” project aims to address these challenges and revolutionize the retail industry through the integration of advanced technology.

METHODOLOGY

Every individual that wants to enter into the process assigns a unique RFID card so that the shopping interface can be started. As soon as user gets assigned to the card through email address and username, they can login on their application with the help of IP address and email address. They can connect the trolley with the Bluetooth so that they can move the trolley anywhere they want. User can interact with the app's control interface (buttons) to choose a movement direction (forward, backward, turn). User can get the information of products added in cart and price of each product. Since we are developing the application for testing purposes, utilization of local system as a server in order to store, manage and update the details of users list, product list (for each user) and the total cost and items are purchased by the user is stored in the database. Mobile should be connected to the server wirelessly during shopping purpose. Graphical user interface is composed of registration of new users, managing the users, clear data and checkout functions are implemented. Initially the message is shown on the 16*2 LCD Display which shows "waiting for user" message. As soon as the customer scans the user card, the welcome message is shown on the display "Hello *username*" for the username that are provided by the user during registration. Next phase involves scanning of different products having RFID embedded. By scanning each product the message is shown on the LCD display and also the details are regularly updated with the help of API on the application. Two buttons are added in the circuit so that they can increment or decrement the count of products being added. Server motor is placed so as to open or close the cart whenever user adds or removes any product from the cart. Once the shopping gets completed, user can visit the counter and complete the checkout process. It can also be done with the help of application. Once as soon as shopping gets completed QR code is displayed on the counter so that user can scan the code and complete the payment process. With the help of GUI, the administrator can keep track of different users being involved in shopping process. Clear functions can be used to clear all the

data regarding user's invoice (purchase history) and can assign the card to the new users.

Based on the interpreted command, the microcontroller generates appropriate signals for the motor driver. The motor driver receives the signals from the ESP 32 and powers the connected motors accordingly. power supply is distributed through ESP32 for driving motors. buzzer is included and when the user scans any product, it gets activated. We have to choose motors based on your desired trolley size and weight. Motor driver bridges the gap between the microcontroller's low-power signals and the motor's higher power requirements. Popular options include L298N or TB6612, allowing control of multiple motor directions and speeds. The microcontroller acts as the central processing unit. It receives commands from the Bluetooth module, controls the motor driver, and might interface with additional sensors if present. The trolley features a dedicated Bluetooth module, often a small chip like HC-05 or HM-10, connected to the microcontroller via serial communication protocols like UART or I2C.

Android Application is developed by using Android Studio with the use of java for implementing functionality of tech trolley application composed of billing and controller section.Api, Windows application is developed with the help of python and PostgreSQL(PGAdmin) is utilized for database storage purposes.

Fig 1: RFID Connections

GENERAL TERMS

ESP32

The ESP32, developed by Espressif Systems, is renowned for its versatility and is widely acclaimed in the field of IoT (Internet of Things) applications. Its popularity can be attributed to its robust processing capabilities, built-in Wi-Fi and Bluetooth connectivity, and efficient power management features. At its core, the ESP32 is equipped with a dual-core Tensilica Xtensa LX6 processor, enabling efficient multitasking and high-performance computing. This architecture makes it well-suited for handling complex tasks in IoT devices. One of its standout features is its integrated Wi-Fi (802.11 b/g/n) and Bluetooth (Bluetooth v4.2 BR/EDR and BLE) connectivity, facilitating seamless communication with other devices and networks. This capability is crucial for IoT devices requiring connectivity for data exchange, remote control, or interaction with cloud services

Fig 2: ESP32

RFID Reader

RFID-based library systems extend beyond basic security measures to include tracking functionalities, blending security with convenience. This integration facilitates quicker and more streamlined check-in/check-out processes, inventory management, and material handling within libraries. Unlike conventional theft detection systems, RFID technology reads data stored on microchips embedded in markers attached to library materials, irrespective of their orientation or placement.

This capability eliminates the necessity for a direct line-of-sight or fixed positioning, enhancing efficiency and usability.

RFID Tag

RFID tags find application across diverse industries for tracking and identification needs, available in various types such as passive, active, and semi-passive tags. Passive tags function by harnessing energy from the RFID reader as they do not have an internal power source. On the other hand, active tags are equipped with their own power source, allowing them to transmit signals over longer distances.

L298N Motor Driver

This L298N Motor Driver Module is a high-power motor driver module for driving DC and Stepper Motors. This module consists of an L298 motor driver IC and a 78M05 5V regulator. L298N Module can control up to 4 DC motors, or 2 DC motors with directional and speed control.

Fig 3: L298N Motor Driver

HC-05 Bluetooth Module

HC-05 is a well-known Bluetooth module that can enhance your projects by providing two-way (full-duplex) wireless capabilities.

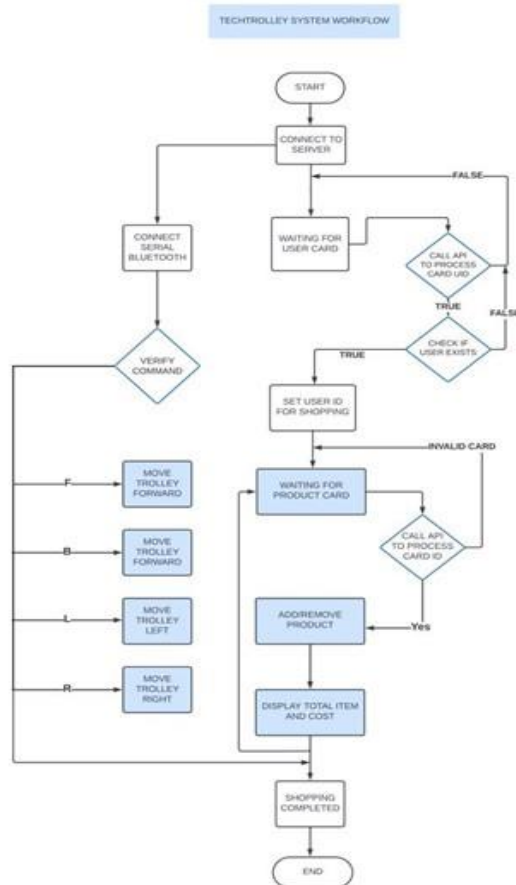

Fig 6: Flow Chart

FEASIBILITY STUDY

Technical Feasibility

While the technology behind RFID tags, Bluetooth, and microcontrollers is well-established and cost-effective, realizing their potential requires significant infrastructure investment and careful attention to customer privacy. Ensuring reliable RFID reads and stable Bluetooth connections in the bustling environment of a retail store can be a complex task. However, the potential benefits are enticing. Simplified checkouts, improved operational efficiency, and personalized recommendations could transform the shopping experience. Ultimately, the success of smart shopping carts depends on their ability to navigate technical challenges

smoothly, gain customer trust through secure practices, and seamlessly integrate into existing retail systems. The journey toward smarter shopping may be challenging, but the opportunity to revolutionize the experience justifies our enthusiastic pursuit.

Social Feasibility

Social feasibility considers users' familiarity and grasp of the system. If the proposed system is user-friendly and straightforward, including for older individuals, it will require minimal effort. Therefore, the system is socially feasible, accommodating a broad user base with ease. The technical feasibility assessment affirms the system's capability to manage RFID tags and offer valuable features. Similarly, the social feasibility evaluation suggests that users, irrespective of age, can readily understand and embrace the proposed system. These conclusions bolster the project's viability and potential for success.

ADVANTAGES

Faster checkout times and reduced queues: No more waiting in line to scan each item individually.

Improved accuracy and reduced errors: Say goodbye to scanning errors and double charges.

Real-time inventory management: Stores gain valuable insights into customer behavior and product trends through the data collected by smart trolleys. This allows for optimizing inventory levels, targeted promotions, and better store layout planning.

Enhanced accessibility for people with limited mobility: The automated identification and checkout process eliminates the need for manual scanning and lifting, making shopping a more accessible and enjoyable experience for everyone.

LIMITATIONS

High initial investment in infrastructure and technology: Implementing a tech trolley system requires significant upfront costs for tagging all products, equipping trolleys with the necessary hardware and software, and upgrading store infrastructure.

Technical challenges with RFID tag read accuracy and Bluetooth connectivity: Ensuring reliable read accuracy of RFID tags and maintaining stable Bluetooth connections throughout the store can be challenging, especially with large crowds and potential interference from other devices.

Privacy concerns regarding customer data collection and usage: Collecting and storing customer purchase data raises privacy concerns. Stores need to implement robust security measures and ensure transparency in how they collect and use customer data.

Need for customer education and adaptation to new technology: Not everyone is comfortable with using new technology. Stores need to provide clear instructions and training for customers to ensure they can use the smart trolleys effectively.

RESULTS

Fig 6.1: Items display on LCD

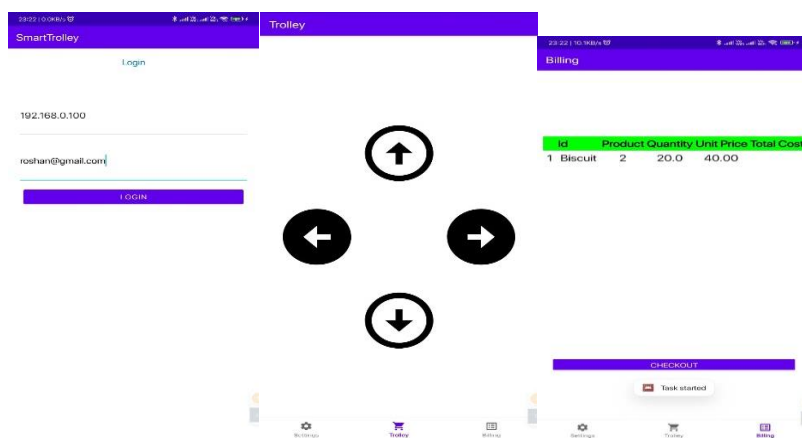

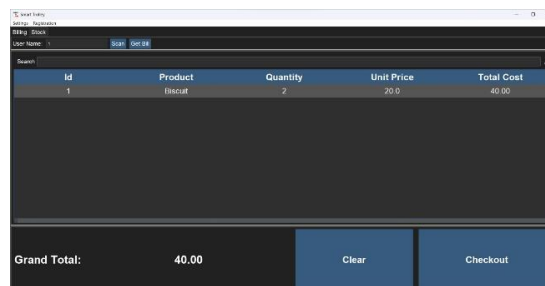

Fig 7: Mobile Application

Fig 8: Graphical user interface

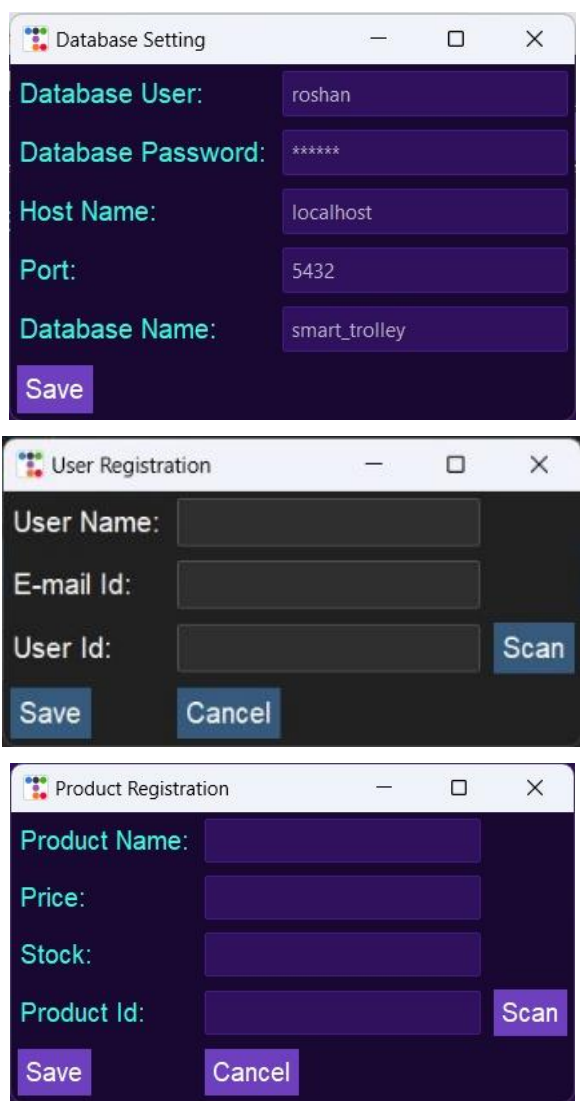

Fig 9: Registration and Database Setting

CONCLUSION

In conclusion, the implementation of tech trolleys marks a significant leap forward in the realm of retail and convenience. These technologically advanced carts seamlessly blend the physical and digital worlds, enhancing the overall shopping experience for consumers. With features such as automated checkouts, real-time inventory tracking, and personalized recommendations, smart trolleys streamline the shopping process, saving time and minimizing friction. Moreover, the integration of IoT (Internet of Things) technology allows for improved efficiency in restocking and inventory management, benefiting both retailers and customers alike. As we embrace the era of smart retail solutions, smart trolleys represent a noteworthy innovation that not only caters to the evolving needs of modern consumers but also sets the stage for the continued convergence of technology and commerce.

The future scope for smart trolleys holds tremendous promise as technology continues to advance and consumer expectations evolve. As we look ahead, these intelligent shopping companions are likely to undergo further enhancements, incorporating cutting-edge technologies such as artificial intelligence, machine learning, and computer vision. Future iterations may offer even more personalized shopping experiences, with trolleys intuitively understanding and anticipating individual preferences. Integration with smart home systems and mobile apps could provide seamless synchronization, allowing users to create shopping lists, receive real-time promotions, and remotely control their trolleys. Additionally, the potential for environmental sustainability features, such as smart waste sorting or ecofriendly packaging alerts, could align smart trolleys with the growing emphasis on responsible consumption. The scope also extends beyond traditional retail, with applications in areas like warehouse management and logistics. Overall, the future for smart trolleys is poised for exciting developments, presenting a dynamic

landscape that fuses innovation, convenience, and adaptability to meet the evolving demands of the modern era.

10. Dr. S Gupta, A Kaur, A Garg, A Verma, A Bansal, and Arvinder Singh discussed the "Arduino Based Smart Cart" in the International Journal of Advance Research in Computer Engineering and Technology, December 2012.
11. Suganya. N, Vismitha. S, and D. Thangakumar present work on "Automated Shopping Trolley for Super Market Billing System" in the International Journal for Research in Applied Science and Engineering Technology, March 2017.

TRIPLE SHIELD-HOLISTIC MOBILE SECURITY WITH PHISHING, MITM AND PERMISSION ANALYSIS

Dr.D. BANUMATHY, ME., Ph.D

*Head of the Dept of Computer Science & Engineering,
Paavai Engineering College (Autonomous) Namakkal, India*

Kesavan L, keerthivasan V

*Final Year, Dept. of Computer Science & Engineering, Paavai Engineering College
(Autonomous) Namakkal, India
Email: kesavan.cse46@gmail.com, keerthivetri92@gmail.com*

ABSTRACT

The Triple Shield-Holistic Mobile Security system is a unified defense mechanism integrating three essential machine learning modules: Phishing Detection, Man-in-the-Middle (MitM) Attack Detection, and Android Malware Detection. By leveraging advanced algorithms, these modules proactively identify and mitigate cyber threats on mobile devices. The Phishing Detection component scrutinizes incoming messages and URLs for potential scams, while the MitM Attack Detection monitors network behavior for signs of interception. Additionally, the Android Malware Detection module continuously analyzes applications to identify and neutralize malicious software. This integrated approach fortifies mobile security by preemptively addressing diverse threats, fostering a safer mobile computing environment for users.

INTRODUCTION

In today's digitally interconnected world, the pervasive use of mobile devices has surged, making them a prime target for various cyber threats. Protecting these devices from evolving security risks is paramount. The Triple Shield-Holistic Mobile Security system represents a groundbreaking approach, amalgamating three crucial

machine learning modules: Phishing Detection, Man-in-the-Middle (MitM) Attack Detection, and Android Malware Detection. This integrated system aims to fortify mobile device security comprehensively by harnessing advanced machine learning algorithms and techniques to proactively identify and counteract an array of cyber threats. By unifying these modules, it endeavors to create a robust shield against phishing attempts, MitM attacks, and Android malware, ultimately fostering a safer and more secure environment for mobile users.

OBJECTIVE

Utilizing machine learning algorithms, the Triple Shield-Holistic Mobile Security system aims to integrate Phishing Detection, Man-in-the-Middle (MitM) Attack Detection, and Android Malware Detection. This unified approach harnesses AI-driven technology to proactively identify and mitigate cyber threats, ensuring comprehensive mobile device security by leveraging advanced algorithms for threat detection and prevention.

PROBLEM STATEMENT

The Triple Shield-Holistic Mobile Security system addresses mobile device vulnerabilities by integrating machine learning for Phishing Detection, MitM Attack Detection, and Android Malware Detection. Its unified approach aims to proactively identify and mitigate cyber threats, ensuring comprehensive mobile security through advanced AI-driven algorithms.

EXISTING SYSTEM

In the current mobile security landscape, various tools exist to address specific threats like phishing, Man-in-the-Middle attacks, and Android malware. These include anti-phishing software, antivirus apps, and network monitoring solutions. However, while effective individually, there's a lack of a fully integrated system combining these components. The Triple Shield-Holistic Mobile Security initiative aims to bridge this gap by merging Phishing Detection, MitM Attack Detection, and

Android Malware Detection into a single solution utilizing machine learning. This unified approach intends to offer enhanced security by addressing multiple threats concurrently, providing a more robust defense mechanism for mobile users.

Disadvantage:

Overcome some problems related to existing problems

Complexity Overload

False Positives/Negatives

Adaptability Challenges

PROPOSED SYSTEM

The proposed Triple Shield-Holistic Mobile Security system integrates three vital machine learning modules - Phishing Detection, Man-in-the-Middle Attack Detection, and Android Malware Detection - leveraging sophisticated boosting algorithms. This unified system aims to fortify mobile device security comprehensively. The boosting algorithms within each module enhance the accuracy and efficiency of threat detection processes. The Phishing Detection module identifies potential scams in messages and URLs, while the Man-in-the-Middle Attack Detection monitors network anomalies for secure communication. Additionally, the Android Malware Detection continuously analyzes app behavior for malware presence. This integration, powered by boosting algorithms, provides a holistic defense against diverse cyber threats. The system's use of boosting algorithms significantly improves proactive threat identification and mitigation, ensuring a safer mobile computing environment for users.

Advantages:

Improved Accuracy

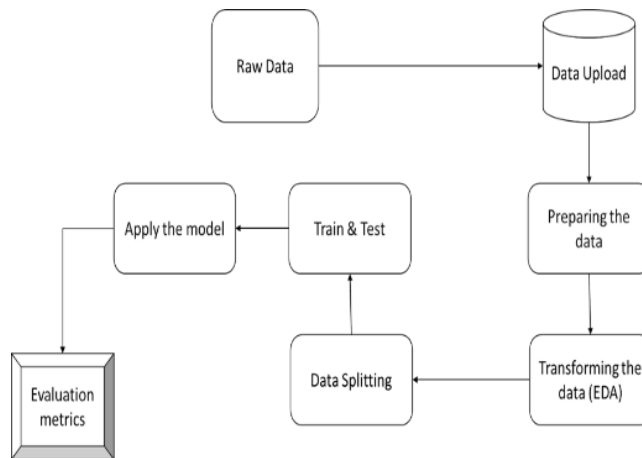

Misclassified samples, boosting algorithms can help in reducing false positives and false negatives

Optimized Integration

Efficient Resource Utilization

Adaptability to Changing Threat Landscapes

SYSTEM ARCHITECTURE

MODULES

- Collection Of Data
- Pre-Processing The Data
- Extraction Of Features
- Evaluating The Model

COLLECTION OF DATA:

Data collection is a process that gathers information on attacked data from a variety of sources, which I utilized to create machine learning models. A set of attacked data with features is the type of data used in this work. The selection of the subset of all accessible data that you will be working with is the focus of this stage. Ideally, ML challenges begin with a large amount of data (examples or observations) for which you already know the desired solution. Label data is information for which you already know the desired outcome.

PRE-PROCESSING THE DATA

Format, clean, and sample from your chosen data to organise it. There are three typical steps in data pre-processing:

Formatting:

It's possible that the format of the data you've chosen is not one that allows you to deal with it. The data may be in a proprietary file format and you would like it in a relational database or text file, or the data may be in a relational database and you would like it in a flat file.

Cleaning:

Data cleaning is the process of replacing missing data. There can be data instances that are insufficient and lack the information you think you need to address the issue. These occurrences might need to be eliminated.

Sampling:

You may have access to much more data than you actually need that has been carefully chosen. Algorithms may require more compute and memory to run as well as take significantly longer to process larger volumes of data. You can choose a smaller representative sample of the chosen data, which may be much faster for exploring and testing ideas, rather than thinking about the complete dataset.

EXTRACTION OF FEATURES

The next step is to A process of attribute reduction is Feature extraction. Feature extraction actually alters the attributes as opposed to feature selection, which ranks the current attributes according to their predictive relevance. The original attributes are linearly combined to generate the changed attributes, or features. Finally, the Classifier algorithm is used to train our models. We make use of the acquired labelled dataset. The models will be assessed using the remaining labelled data we have. Pre-processed data was categorised using a few machine learning methods.

EVALUATING THE MODEL

The model development process includes a step called model validation. Finding a model that best represents the data and predicts how well the model will perform

in the future is useful. In data science, it is not acceptable to evaluate model performance using the training data because this can quickly lead to overly optimistic and over fitted models. Hold-Out and Cross-Validation are two techniques used in data science to assess models. Both approaches use a test set (unseen by the model) to assess model performance in order to prevent overfitting.

Based on its average, each categorization model's performance is estimated. The outcome will take on the form that was imagined. graph representation of data that has been categorized.

Proposed Approach Steps: -

We start by using the dataset of malware attacked data.

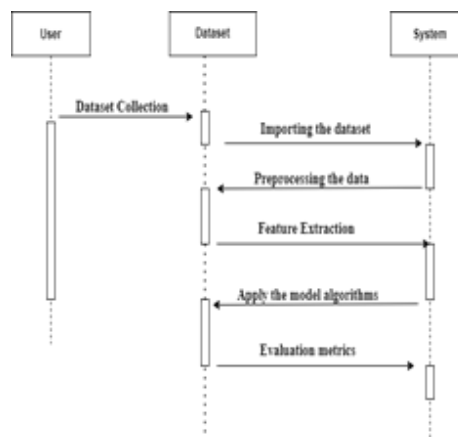

Filter the dataset in accordance with the needs, then construct a new dataset with attributes that correspond to the analysis to be performed.

Pre-process the dataset before using it. Distinguish training from testing data.

Analyze the testing dataset using the classification algorithm after training the model with training data.

You will receive results as accuracy metrics at the end.

ARCHITECTURE DAIAGRAM

Machine Learning v/s Traditional Programming: -

Traditional programming differs significantly from machine learning. In traditional programming, a programmer codes all the rules in consultation with an expert in the industry for which the software is being developed. The machine executes the output after the logical statements. As your system becomes more complex, you will need to create more rules. Similarly, the odds of success in unfamiliar situations are lower than in known ones.

How does Machine learning work? Machine learning is the brain where all the learning takes place. The way the machine learns is similar to the human being. Humans learn from experience. The more we know, the more easily we can predict. Machines are trained the same. To make an accurate prediction, the machine sees an example. When we give the machine a similar example, it can figure out the outcome. However, like a human, if it feeds a previously unseen example, the machine has difficulties to predict. The core objective of machine learning is the learning and inference. First of all, the machine learns through the discovery of patterns. This discovery is made thanks to the data.

First, machines learn by discovering patterns. This discovery is thanks to data. It's important for data scientists to choose carefully which data to make available to machines. A list of attributes used to solve a problem is called a feature vector. A feature vector can be thought of as a subset of data used to address a problem. Therefore, the learning stage is used to describe the data and summarize it into a model

Classification: -

Suppose you want to predict the gender of a commercial customer. Collect data about height, weight, occupation, salary, shopping cart, etc. from your customer database. You know the gender of each customer, but only male or female. The purpose of the classifier is to assign probabilities of whether you are male or female (i.e. a label) based on information (i.e. features collected from you). Once the model learns to recognize males or females, it can use new data to make predictions. For

example, suppose you just received new information from an unknown customer and want to know if the customer is male or female. If the classifier predicts Male = 70%, it means that the algorithm has 70% confidence that this customer is male and she is 30% female. A label can consist of two or more classes. The example above has only two classes, but there are dozens of classes (glass, table, shoes, etc.) if the classifier needs to predict an object. Each object represents a class).

Recurrence:-

If the output is continuous, the task is regression. For example, a financial analyst may need to predict the value of stocks based on many characteristics such as stocks, historical stock performance, macroeconomic indicators, and more. The system is trained to estimate stock prices with as few errors as possible.

Linear regression:

A machine learning algorithm built on supervised learning is linear regression. Activate a regression task. Run a regression task. Regression models target predictors based on independent variables. Different regression models differ based on the type of relationship between dependent and independent variables considered and the number of independent variables used. The dependent variable in regression has many names. This is sometimes called the outcome variable, criterion variable, endogenous variable, or regression sand. Independent variables are sometimes called exogenous variables, predictor variables, or regressors.

Logistic regression

Logistic regression is one of the most popular machine learning algorithms that falls under supervised learning techniques. Logistic regression predicts the output of a categorical dependent variable. Using a specific collection of independent factors, it is used to predict a categorical dependent variable. As a result, the outcomes must be discrete or categorical. can be true or false, 0 or 1, yes or no, and so forth. But instead of giving exact values as 0 and 1, it gives probability values

between 0 and 1. Logistic regression is very similar to linear regression except for how it is used. Linear regression is used to solve regression problems and logistic regression is used to solve classification problems.

Decision tree

Decision trees are a supervised learning technique that can be used for both classification and regression problems, but they are mostly suitable for solving classification problems. It is a tree-structured classifier, with internal nodes representing characteristics of the data set, branches representing decision rules, and each leaf node representing a result. A decision tree has two types of nodes, a decision node and a leaf node. Decision nodes are used to make decisions and have multiple branches, while leaf nodes are the result of those decisions and contain no further branches. A decision or test is made based on the characteristics of a particular data set. A graphical representation to get all possible solutions to a problem/decision based on given conditions.

Unsupervised learning:

In unsupervised learning, algorithms examine input data without explicit output variables (for example, examine customer demographics to identify patterns). It can be used when you don't know how to classify your data and want the algorithm to find patterns and classify your data.

Machine Learning Applications:

Augmentation:

Machine learning to support people in their personal or business daily tasks without having full control over the outcome. Machine learning like this is used in a variety of ways. B. As virtual assistants, data analytics, and software solutions.

Machine learning that works fully autonomously in each domain without the need for human intervention. For example, robots that perform critical process steps in a production plant. Financial sector:

Machine learning is becoming more and more popular in the financial industry. Banks primarily use ML to find patterns in data, but they also use it to prevent health. Government agency:

Governments use ML to manage public safety and utilities. Take China, for example, with its large-scale facial recognition. The government uses artificial intelligence to prevent jaywalkers. Healthcare industry:

Healthcare is one of the first industries to use machine learning with image recognition.

NUMPY

NumPy is the fundamental package for scientific computing in Python. It is a Python library that provides a multidimensional array object, various derived objects (such as masked arrays and matrices), and an assortment of routines for fast operations on arrays, including mathematical, logical, shape manipulation, sorting, selecting, I/O, discrete Fourier transforms, basic linear algebra, basic statistical operations, random simulation and much more. At the core of the NumPy package, is the ndarray object. This encapsulates n-dimensional arrays of homogeneous data types, with many operations being performed in compiled code for performance. There are several important differences between NumPy arrays and the standard Python sequences:

- NumPy arrays have a fixed size at creation, unlike Python lists (which can grow dynamically). Changing the size of an ndarray will create a new array and delete the original.
- The elements in a NumPy array are all required to be of the same data type, and thus will be the same size in memory. The exception: one can have arrays of (Python, including NumPy) objects, thereby allowing for arrays of different sized elements.
- NumPy arrays facilitate advanced mathematical and other types of operations on large numbers of data. Typically, such operations are executed more efficiently and with less code than is possible using Python's built-in sequences.
- A growing plethora of scientific and mathematical Python-based packages are using NumPy arrays; though these typically support Python-sequence

input, they convert such input to NumPy arrays prior to processing, and they often output NumPy arrays. In other words, in order to efficiently use much (perhaps even most) of today's scientific/mathematical Python-based software, just knowing how to use Python's built-in sequence types is insufficient - one also needs to know how to use NumPy arrays. The points about sequence size and speed are particularly important in scientific computing. As a simple example, consider the case of multiplying each element in a 1-D sequence with the corresponding element in another sequence of the same length. If the data are stored in two Python lists, *a* and *b*, we could iterate over each element:

The Numeric Python extensions (NumPy henceforth) is a set of extensions to the Python programming language which allows Python programmers to efficiently manipulate large sets of objects organized in grid-like fashion. These sets of objects are called arrays, and they can have any number of dimensions: one dimensional arrays are similar to standard Python sequences, two-dimensional arrays are similar to matrices from linear algebra. Note that one-dimensional arrays are also different from any other Python sequence, and that two-dimensional matrices are also different from the matrices of linear algebra, in ways which we will mention later in this text. Why are these extensions needed? The core reason is a very prosaic one, and that is that manipulating a set of a million numbers in Python with the standard data structures such as lists, tuples or classes is much too slow and uses too much space. Anything which we can do in NumPy we can do in standard Python - we just may not be alive to see the program finish. A more subtle reason for these extensions however is that the kinds of operations that programmers typically want to do on arrays, while sometimes very complex, can often be decomposed into a set of fairly standard operations. This decomposition has been developed similarly in many array languages. In some ways, NumPy is simply the application of this experience to the Python language - thus many of the operations described in NumPy work the way they do because experience has shown that way to be a good one, in a variety

of contexts. The languages which were used to guide the development of NumPy include the infamous APL family of languages, Basis, MATLAB, FORTRAN, S and S+, and others. This heritage will be obvious to users of NumPy who already have experience with these other languages. This tutorial, however, does not assume any such background, and all that is expected of the reader is a reasonable working knowledge of the standard Python language. This document is the “official” documentation for NumPy. It is both a tutorial and the most authoritative source of information about NumPy with the exception of the source code. The tutorial material will walk you through a set of manipulations of simple, small, arrays of numbers, as well as image files. This choice was made because:

- A concrete data set makes explaining the behavior of some functions much easier to motivate than simply talking about abstract operations on abstract data sets;
- Every reader will at least an intuition as to the meaning of the data and organization of image files, and
- The result of various manipulations can be displayed simply since the data set has a natural graphical representation.

All users of NumPy, whether interested in image processing or not, are encouraged to follow the tutorial with a working NumPy installation at their side, testing the examples, and, more importantly, transferring the understanding gained by working on images to their specific domain. The best way to learn is by doing – the aim of this tutorial is to guide you along this “doing.”

Python functions

Python features are:

Easy to learn: Python has few keywords, a simple structure, and a well-defined syntax. This allows students to learn the language quickly. **Easy to maintain:** Python source code is fairly easy to maintain. **Extensive standard library:** Most Python libraries are highly portable and cross-platform compatible with UNIX, Windows, and Macintosh. **Interactive mode:** Python supports an interactive mode that allows interactive testing and debugging of code snippets.

These modules allow programmers to extend or customize the tools to make them more efficient.

GUI programming: Python supports many system calls, libraries, and GUI applications that can be Win and ported to Windows systems such as Windows MFC, Macintosh, and Unix's X Window System.

Scalable:

Python offers better structure and support for large programs than shell scripts.

Apart from the features mentioned above, Python has a long list of great features, some of which are listed below.

IT supports functional and structured programming techniques as well as OOP. Can be used as a scripting language or compiled to bytecode to build large applications.

Provides dynamic data typing at a very high level and supports dynamic type checking.

IT supports automatic garbage collection.

Easy integration with C, C++, COM, ActiveX, CORBA, and Java.

Python is available on various platforms such as Linux and Mac OS X.

Anaconda Navigator: -

Anaconda Navigator is a desktop graphical user interface (GUI) included in the Anaconda distribution that lets you launch applications without using command line commands and easily manage conda packages, environments, and channels. Navigator can search for packages in Anaconda Cloud or local Anaconda repositories. Available for Windows, Mac OS and Linux. Why Use Navigator? Many scientific packages depend on specific versions of other packages to run. Data scientists often work with multiple versions of many packages and use multiple environments to separate these different versions. The conda command line utility is both a package manager and an environment manager, helping data scientists

ensure that all versions of all packages have all the required dependencies and are working properly. . The Navigator is an easy way to point-and-click through packages and environments without typing conda commands in a terminal window. You can use it to search for required packages, install them in your environment, run packages, and update them all from within Navigator.

WHAT APPLICATIONS CAN I ACCESS IN NAVIGATOR? The following applications are available in Navigator by default.

JupyterLab

Jupyter Notebook

QT Console

Spider

VS code

Orange 3 app

Rodeo

R Studio

Advanced Conda users can also create their own Navigator application How do I run code in Navigator? The easiest way to do this is with Spyder. From Navigator's Home tab, click Spyder to write and run code. Jupyter Notebook can be used as well. Jupyter Notebooks are an increasingly popular system that combines code, explanatory text, output, images, and an interactive interface into a single notebook file that can be edenvironment-relatedsed in a web browser. New in 1.9

Add offline mode support for all environment related actions.

Added support for custom configuration of main window links.

Numerous bug fixes and performance improvements.

Test:-

Software testing is research conducted to provide interested parties with information about the quality of the product or service being tested. Software testing also provides an objective and independent view of software, enabling organizations

to assess and understand the risks involved in implementing software. Testing techniques include, but are not limited to, the process of running a program or application for the purpose of finding software bugs. Software testing can also be described as the process of validating and verifying software programs/applications/products.

Meet business and technical requirements that guide design and development. Works as expected and can be implemented with the same characteristics. Test Method:-

Functional test:

Functional testing systematically demonstrates the availability of tested functionality according to business and technical requirements, system documentation, and user guides.

Function:

Must perform the identified function. Output: A software output of the identified class must be performed. Systems/procedures: Systems must function properly.

Integration testing:

Software integration testing is incremental integration testing of two or more software components integrated on a single platform, producing errors caused by interface flaws.

A test case for checking an Excel spreadsheet:

Machine learning here deals with data sets in the form of Excel spreadsheets. So if you want a test case, you should check the Excel file. Classification is then performed on the corresponding columns of the dataset.

Future enhancement:

In future enhancements, the Triple Shield-Holistic Mobile Security system aims to bolster its capabilities by integrating advanced behavioral analysis for Android

Malware Detection, extending support to multiple mobile platforms beyond Android, educating users about emerging threats, integrating with cloud-based threat intelligence, and enhancing user privacy controls. These enhancements will fortify the system's ability to proactively identify and mitigate evolving cyber threats while empowering users with greater control over their device's security and privacy.

Requirement specifications:

Software requirements:

Package: Numpy, Matplotlib, Pandas, Seabron,Sklearn

IDE: Anaconda Navigator

Tool: Jupiter Notebook Dataset

Python Version : Python 3

Hardware requirements:

Processor : Intel i3

Hard Disk : 500 GB

RAM : 2 GB

Operating System: Windows7 or above.

Hardware Explanation:

This specification outlines the minimum system requirements for running the software on different versions of the Windows operating system. It indicates compatibility with Windows 7, 8, and 10, both 32-bit and 64-bit editions. Additionally, it specifies a minimum RAM (Random Access Memory) requirement of 4GB, ensuring smooth performance and adequate memory allocation for the software to operate effectively on these systems.

CONCLUSION:

The Triple Shield-Holistic Mobile Security system, integrating Phishing Detection, MitM Attack Detection, and Android Malware Detection via machine learning,

promises comprehensive mobile security. However, challenges like system complexity, resource demands, and potential false detections exist. The proposal to include boosting algorithms offers improved accuracy and adaptability. Despite its potential, addressing complexities, privacy concerns, and costs will be crucial for ensuring its effectiveness in providing robust mobile device protection

ABSTRACT

Many excellent technologies can communicate without human intervention. By analyzing network traffic, ml models can also detect security threats such as intrusions and malicious behaviour. IoT innovations can improve people's lives by enabling easy, intelligent applications. However, network security worries has been raised about the frameworks' cross-cutting nature and multidisciplinary organization. Due to inherent shortcomings, gadget security measures like as encryption, validation, access control, network security, and application security are ineffective upgrade existing security techniques to protect the ML environment previous years has seen substantial advances in Machine Learning (ML). ML can also be helpful to detect many hacker attacks that are difficult for the humans to detect before they happen. Machine learning can reduce human activity in order to enhance network security.

INTRODUCTION

Machine learning (ML) uses unique methodologies to identify both 'normal' and 'strange' behaviour as parts and devices interact in the real world . The Collecting and exploring information from the each part of the framework can identify common areas of connection, leading to early detection of hostile behaviour. Machine learning (ML) can accurately forecast future assaults by learning from existing systems, making it valuable for the anticipating transformations of earlier attacks. This section presents a detailed feasibility study of the machine. To ensure the resilient and safe systems, systems should develop beyond relying solely on sunlight communication and incorporate security insights enabled by machine learning (ML) techniques. Information systems are now of critical to all businesses, regardless of the size or industry. Nonetheless, the data saved and services provided by these information systems pose as possible as targets for a variety of attacks. These attacks, with their wide range and system-specificity, can have the disastrous repercussions. In this environment, the computer security has emerged as a serious concern, with more study being conducted in this field. Various methods and mechanisms are of developed to ensure a level of the safety that matches the demands of modern life. These tools include the Intrusion Detection System. Network IDS are tools designed to detect the attempted attacks on a network and to identify anomalous activities and behaviours that are intended to interfere with the Network Security.

LITERATURE SURVEY

The literature review for the "Design and Implementation of Intrusion Detection System through Collaborative ML" looks at the present state of intrusion detection systems (IDS) and ml applications in network security. It addresses classic IDS limitations and the progress of intrusion detection systems. The review that looks into the function of the ml, looking at various algorithms and their efficacy in IDS. Collaborative ml receives special emphasis, including discussions of how it can be used in the network security and previous studies in the conte intrusion detection.

The survey examines the obstacles in current methodologies, gives pertinent case studies, and to compares collaborative alternatives to traditional methods. The assessment closes with the identification of the developing patterns and future research directions in the discipline.

PROBLEM STATEMENT

The growing sophistication of the cyber assaults presents in an important threat to the security of digital systems and networks. Traditional intrusion detection systems (IDS) frequently fails to keep up with the emerging attack tactics. To several ml models. The study's goal is to look into the limitations of current IDS and see how collaborative machine learning might help to improve accuracy, efficiency, and adaptability. By comprehending the complexities of collaborative ml in the context of intrusion detection, this study hopes to give significant insights that can inform the creation of the more robust of Network security and its approaches.

NETWORK SECURITY DESIGN

(HOW IT LOOKS LIKE AND HOW IT CAUSES THE PROBLEM)

Fig 1 : Network Security Diagram

Here's an example of a Network Security Diagram and how it's applied to IT infrastructure: A Network Security Diagram Example depicts an IT network's security components and how they interact. Its primary goal is to assist administrators and other stakeholders in identifying potential threats and designing

mitigation strategies that are suited to their individual security requirements. Detailed diagrams can also give a critical insight into a network's potential weaknesses, allowing teams to develop an effective risk management approach. Network Security Diagram Examples are useful graphical representations of the applications of securities policy in an IT infrastructure and can be used to demonstrate compliance.

SYSTEM DESIGN

The software design for the "Design and Implementation of Intrusion Detection System through Collaborative Machine Learning" includes developing a comprehensive system architecture. This includes creating modules for data collection and preprocessing, the integrating collaborative ml algorithms for intrusion detection, and incorporating user authentication with role-based access control. Critical features like real-time monitoring, alerting, and logging are included to ensure quick reactions to suspected incursions and detailed audit trails for analysis. The system prioritizes scalability, performance optimization, and seamless integration with current security infrastructure. A user- friendly interface, combined with the visualization tools, helps with the system configuration, monitoring, and the reporting

Fig 2 : Data Flow Diagram

FUNCTIONAL REQUIREMENTS OF NETWORK INTRUSION DETECTION SYSTEM SECURITY

Requirement analysis serves as a pivotal software engineering activity, bridging the allocation of system-level software to the subsequent software design phase.

It empowers system engineers to articulate software interfaces and delineate design constraints. Furnishes software designers with details and functional representations that can be translated into architectural frameworks and operational procedures.

NON FUNCTIONAL REQUIREMENTS OF NETWORK INTRUSION DETECTION SYSTEM SECURITY

Security: Implementation of project-level security, mandating user login at program initiation. Option for creating additional users and defining protection levels is available. User-level security, while not currently configured, can be easily implemented with minimal adjustments.

Reliability, Availability, and Maintainability: Highly user- friendly program with a strong emphasis on safety and requiring minimal maintenance. Capability for incremental upgrades to align with evolving requirements.

Configuration and Compatibility: Articulates specific requirements for individual customization or operations in diverse contexts.

Usability :Details the user-friendly features, including error messages guiding users to solutions.

MACHINE LEARNING IN THE NETWORK SECURITY:

Threats detecting: can be used to create prediction models for recognizing and the detecting suspicious and critical behaviour or network attacks in the communications of the networks. This models that can be used to analyze massive volumes of the data in most real time from a large variety of the sources, and

including networks logs, packets traffic, and user behaviour, to detect anomalies and trends associated with malicious activity.

Automating attack responses :is an important part of communications of the network security. ML algorithms can also be helpful to automate attack responses, allowing you to respond to attacks more rapidly and efficiently. For ex, aml systems can be trained to recognized specific sorts of the assaults and automatically initiate suitable counters measures, such as isolating of infected devices or modifying security concern rules.

Detect emerging Network threats. The usual signature-based strategy may be insufficient to detecting those developing threats. Moreover in the absence of specific indicators, the use of the ml algorithms can assist in detecting odd patterns of behaviour that may suggests the advent of new types of assaults.

Reduce False Positives : Traditional security systems frequently produce a substantial number of false positives, which are reports of typical activities that are incorrectly classified as attacks. Dealing with irrelevant reports can results in the waste of important time and resources. Using ml models that can assist reduce false positives, enhancing security operations' efficiency and allowing for more of the accurate threat detection.

Adapt of the continue learning: ML models that can be the change and update in real-time to addresses updated threats and of changing situations in communication networks. Continuous learning enables

models to evolve over time, resulting in a greater understanding of the threats and variants.

Finally, applying machine learning into the communications network security has various benefits, such as an abilities to detecting threats in real time, automated responses, detects new types of attacks, and the reduced false positives. Those advantages help to improving all the network security and protecting underlying data and asset. Data collection: is the First step to the training processes. These data

consists of labelled instances, which are input- output pairs that match. For ex, then if we wish to build the model to detecting photographs of cats, the data will be containing both images marked "cat" and images labelled "not cat."

Data preparation: involved data cleaning, data normalize, and data transformation training of the data for ml models. This may include eliminating missing data, categorizing features, and normalizing numerical values.

Model select and train: Select and train the most of the appropriated ml model for the task at hand. The model is then to be trained on the training of the data, then which entails teaching it to detecting of the patterns and the correlations found in data. On training, of the model is iterative modified to reduce the disparity between the predictions and the output of labels in the training data.

Models Evaluate: More after training, the models is evaluate using new test data. These enable you to evaluating the model's performance in generalized patterns to fresh data. Different metrics, such as accuracies, precisions, and the area under the Roc curves, are then used to measure model performances.

Models Usage: if the model is trained and evaluated, the model can forecast of the new input data. The models leverages the associationsit learnt during the training to make predictions about the new input instance.

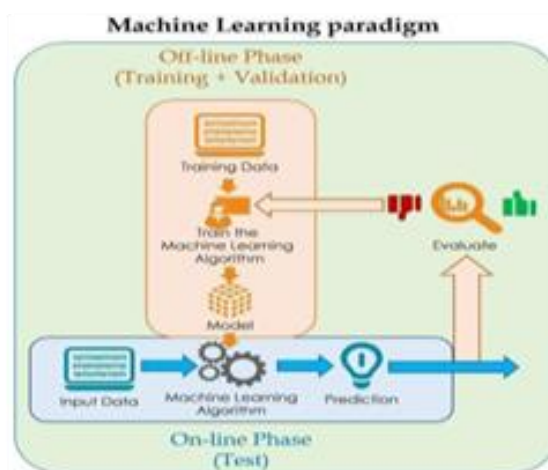

Fig 3 : ML Data Flow Diagram

Approaches to Machine Learning

In practice, all dl algorithms are neural networks that share from fundamental traits. They are all composed of the linked

neurons organized in layers. What distinguishes them is their network architecture (or how neurons are organized in the network) and, in some cases, their formation. This cutting-edge IDS employing the DL techniques has provided us with a worldwide perspective on what is currently being done in this space. The model and its parameters will be primarily determined by the desired outcome, particularly because the IDS is an NIDS. Behavioural IDS based on the unsupervised ml techniques have a clear benefit because they don't need to know all of the attacks

Advantages of ML in Network security:

ML systems can then also be trained to:

Predict potential cyber-attacks and assist businesses better mitigate their effects.

Create alarms and notify companies of cyber risks.

Rapidly identify cyber-attacks and shorten response times.

Identify weaknesses in the company's digital structure, monitor the attack surface, and report irregularities

Fig 4 : An example use case of Network Security

Disadvantages of ML in Network security

Moreover though ml algorithms have many advantages and uses in cybersecurity, we cannot expect them to solve all of our problems. The zero-trust approach should

be applied to the ml as well. No system is totally secure. Given enough time, every system can be hacked or exploited, thus we should approach machine learning systems with caution and provide the necessary safeguards.

In addition to security concerns surrounding machine learning systems in cybersecurity, firms may face financial costs when applying machine learning solutions to cybersecurity problems. Not every company can incorporate machine learning technologies into its cybersecurity defenses.

Five Real-Life Examples of the ML in Network security:

Network traffics analysis

Network traffics analysis can use ML techniques to detect attacks like DDoS. A trained algorithm, for example, can recognize the high volume of traffic a server receives during a DDoS assault and alert authorities within your firm to remediate the situation. Furthermore, the algorithms can detect the attack vector or attack type (for example, TCP Flood), allowing SOC teams to prepare for future cyber attacks. ML algorithms in network traffics analysis can be also detect bots or botnet activity, protecting servers from malevolent threat actors attempting to exploit them using botnets

Endpoint Fortification

It is critical for businesses to safeguard their endpoints against malware and viruses. By discovering unknown cyber dangers, ml algorithm can be improved endpoint protection and aid anti-viruses and firewalls. ML algorithms may also identify inbound dangerous packages like malware, ransomware, or spyware, assisting SOC teams in prioritizing and preventing future digital threats. Furthermore, ML-assisted endpoint to protection can detect anomalies at endpoints and notify authorities, resulting in shorter response times and faster detection of potential threats.

Application Security

Application security solutions, such as Web Application Firewalls (WAFs), use machine learning to protect servers and systems against cyber-attacks aimed at the application layer (Layer 7 of the OSI model). For example, ML-based systems can be trained to detect irregularities in HTTP requests and trigger alerts in event of the attack. They can also be trained to identify attack types (e.g., SQL injection, XSS attacks) and attack vectors. SOC teams can use the knowledge obtained from these algorithms to strengthen cyber defense architecture.

Attack Surface Management

Managing and monitoring an organization's attack surface can be difficult for SOC teams since the digital attack surface of major firms is always rising. An AI-based approach to attack surface management can alleviate the burden on SOC teams while ensuring fault-free management and monitoring. SOC Radar uses machine learning techniques to continually monitor your organization's attack surface and to proactively give alarms for vulnerabilities (for example, Critical Open Port Detected Alert). Below is an example alert generated by SOC Radar's Attack Mapper, which uses ML algorithms in its operations.

Authentication Security

There are numerous authentication security measures available to avoid cyber identity fraud and account takeovers, including 2FA (two-factor authentication), CAPTCHA (Completely Automated Public Turing test to differentiate between computers and humans), and facial and fingerprint recognition. ML and Ai are also used in authentication security. Facial and fingerprint recognition software directly uses machine learning techniques to work, providing additional security to hardware systems such as phones and laptops. ML in authentication security also use additional algorithms to help protect against account takeover attacks.

Adversaries use credential stuffing or brute force attacks to gain access to accounts, potentially compromising the enterprise network.

CONCLUSION

Finally, the "Design and Implementation of Intrusion Detection System through Collaborative Machine Learning" demonstrates a promising technique to improving the network security. The comprehensive system architecture, which includes collaborative ml algorithms for intrusion detection, demonstrates a proactive approach to emerging threats. The integration of the user authentication, real-time monitoring, alerting, and logging services ensures a strong defense system. Prioritizing scalability, speed optimization, and the seamless connection with existing security infrastructure enhances that of the system's adaptability. The user-friendly interface, which includes the visualization tools, enables rapid configuration, monitoring, and the reporting. Rigorous testing certifies that the system's dependability, while detailed documentation ensures its maintainability. This research adds to the evolution of intrusion detection systems, laying the groundwork for resilient and responsive network security solutions in the face of modern threats

SRM Arts and Science College, Kattankulathur-603203
Email: sho13velfam@gmail.com ,dbbhuvanesh@gmail.com*

ABSTRACT

An attempt has been made to build and construct an automatic tagger that can extract and tag free text. Words are categorized by part-of-speech taggers (POS) according to their types, functions, and meanings (noun, verb, adjective, etc.). Two-stage tagging systems based on MPL, FRNN, and SVM have been developed and implemented. The approach makes it easy to classify words and assign the proper POS to each one. Two distinct languages, Arabic and Hindi, have been used to test the taggers. For Arabic text, the word disambiguation issue has been properly resolved. Fix grammatical errors and typos in the text.

Punctuation, special symbols and expressions are removed. Punctuation helps readers understand any text by separating sentences or portions of sentences. But as a model is being trained, it might introduce more ambiguity. Additionally, unique symbols found in texts, such as emojis, links, and emails, can hinder a machine's comprehension of the text's meaning. Regular expressions are a useful tool for matching text patterns; these symbols and symbol sequences are frequently removed using them. Tokenization is a fundamental step in NLP tasks and refers to splitting a text into smaller units of meaning called tokens. It can be words, pieces of words, or phrases. English is space-delimited, so the most common approach is to split a text into white spaces. Thus, the sentence "I have got a faulty size" is converted into a sequence of tokens [I, have, got, a, faulty, size]. However, there are other approaches to tokenization.

NLP, NLU, NLG

INTRODUCTION

Deep Learning uses Artificial Neural Networks (A.N.N.) to simulate and model the operations of the human brain. Among all of AI's significant fields is this one. These neural networks try to imitate how the brain functions in order to learn from enormous volumes of data. A neural network with only one layer may only be able to approximate things; Hidden layers, however, can improve the network's prediction accuracy. Numerous artificial intelligence services and apps employ deep learning to automate a range of analytical and physical tasks. One of the most widely used techniques in today's culture is deep learning.

Soft Computing (SC) refers to a collection of computational paradigms which attempt to utilize tolerance for imprecision, uncertainty, robustness and tiny solution cost to formularize real-world problems. SC generally includes Artificial Neural Networks (ANN), Fuzzy Logic (FL), Evolutionary Computing, Genetic Algorithms (GA) and Rough Set Theory. The primary attributes of SC are their capacity to assess, determine, verify, and compute within an ambiguous and imprecise domain, mimicking human talents in the application of learning from prior experience. One definition of natural language processing (NLP) is an automated or semiautomated method of processing human language.

**Fig.1: Computerized Processing Methodologies**

Recently, a significant field of research and commercial development has grown around the use of language processing for Arabic and Hindi applications. A quick and precise point-of-sale (POS) tagger is one of the main essential elements of most natural language processing (NLP) applications. Words are grouped into parts of speech (POS) based on their functions and meanings. For the majority of NLP applications, including speech recognition, information extraction, machine translation, and grammar and spelling checkers, the POS tagger is essential. Furthermore, variables like ambiguous words, phrases, unknown words, and multipart words affect how accurate the POS tagging is. Certain characteristics motivate scientists to support the use of neural networks as problem-solving tools. Massive parallelism, homogeneity, generalization capacity, distributed representation and computation, learnability, trainability, and adaptability are among the most crucial characteristics.

Numerous facets of artificial intelligence, including speech recognition, image processing, natural language processing, pattern recognition, and classification problems, have seen the successful use of neural techniques [2]. More physiologically and computationally plausible than other adaptive models like Hidden Markov Models (HMM), Feed Forward Networks, and Support Vector Machines (SVM), Recurrent Neural Networks (RNN) are a network of neurons with feedback connections. SVMs are regarded as supervised learning techniques that are applied to tasks involving regression and binary classification. They are a member of the generalized linear classifier family. SVM's primary benefits come from their ability to optimize the geometric margin and decrease the experimental classification error at the same time.

Removal of contractions: A contraction is a shortened form of a word or a combination of words obtained by dropping letters and replacing them with an apostrophe. Nowadays, with professional and private lives shifting online, people communicate through text messages. They speed up this procedure even further by

using a lot of acronyms and condensed word variants. The most often used contractions in English are "I'll, we're, can't, there's." Eliminating contractions promotes text uniformity by lowering the number of token variations.

Removal of stop words: The most frequently used words in a language are called stop words; examples include "a, is, yours, too, may". They can be found in practically every sentence, but they don't really tell us anything. Eliminating them makes it possible to concentrate on crucial terms and maintain a manageable vocabulary.

Part of speech tagging (POS): Part of speech tagging is assigning a particular part of speech tag to each word in a text based on its definition and context.

Text Pre-processing: English is the primary language of the dataset's text data. Nonetheless, since customers typically submit their inquiries in their native tongue, certain samples are available in several languages. Local language remarks made by small-time vendors are also noted. To make use of this data, a preliminary translation into English is done with the assistance of Amazon Translate, a text translation service that utilizes the attention mechanism and is built on a neural network that follows the encoder-decoder architecture.

Non-text features pre-processing: The current variables are used to generate a number of new non-text features. The discrepancy between dispute ending and escalation dates is thus introduced as a feature showing the escalation period for each dispute. Two other features, which specify the number of days from the order creation date to the order acceptance by a merchant and the dispute beginning dates, were implemented using the same logic. Then, these characteristics are converted to binary ones with values of 1 for "More than 22" and 0 otherwise. These binary features cover certain time periods, such as "Less than 21" or "More than 22" for the duration of escalation and similar for others.

PERFORMANCE MEASURES

Assessing the classification process's effectiveness is crucial in machine learning systems because it is impractical to compare various learning strategies or decide whether to employ a hypothesis. Accuracy is the most crucial factor to consider when evaluating a part-of-speech tagger. Thus, the quality of the output depends on the comparability of conditions such as:

Tag-set size: Normally, using a small number of tag-set can help to give high accurate tagging but it does not offer as much information or disambiguation between the lemmas as a larger one would.

The corpus type: A corpus (corpora is the plural) is a set of text that collected for a purpose. The type of corpus affects the quality of taggers output when the genre or type of the corpus data differs from the tagged material.

Vocabulary type: A training corpus containing samples of such texts is necessary for the tagging of certain documents, such as legal or medical literature; otherwise, the number of unfamiliar words will be abnormally large. Similarly, a high frequency of colloquial language in literary texts frequently results in errors. However, the precision of POS tagging may be impacted by unclear words and phrases, unfamiliar terms, and multi-part words. Ambiguity can be found in the syntax or semantic phases of the language processing sequence, among other levels.

The future of the metaverse will be shaped by soft computing techniques. We stress the importance of multidisciplinary cooperation, the integration of soft computing methods with other technologies, and additional study and advancement of soft computing approaches in the industry. The study's conclusions can be a useful resource for scholars, professionals, and decision-makers in this area since they offer important insights into how soft computing methods may influence the metaverse's future.

TOOLS

Gensim is a high-speed, scalable Python library that focuses primarily on topic modeling tasks. It is quite good at finding similarities between texts, indexing texts, and navigating through different documents. The fact that Gensim can handle enormous data quantities is one of its key advantages.

SpaCy is one of the newer open-source NLP processing libraries. This Python library performs quickly and is well-documented. It is able to handle large datasets and provides users with a plethora of pre-trained NLP models. SpaCy is geared toward those who are getting text ready for deep learning or extraction.

IBM Watson offers users a range of AI-based services, each of which is stored in the IBM cloud. This versatile suite is well-suited to perform Natural Language Understanding tasks, such as identifying keywords, emotions, and categories. IBM Watson's versatility lends itself to use in a range of industries, such as finance and healthcare.

Natural Language Toolkit (NLTK) enables users to create Python programs that are compatible with human language data. Several text processing tools, a lively discussion forum, and more than 50 lexical and corpus resources are all accessible through easy-to-use interfaces on NLTK. Linguists, academics, engineers, and educators frequently use this open-source, free platform.

Monkey Learn is an NLP-powered platform that provides users with a means for gathering insights from text data. This easy-to-use platform provides bespoke machine learning models that can be adjusted to suit different business objectives, in addition to pre-trained models that can do sentiment analysis, keyword extraction, and subject classification. For text analysis, Monkey Learn can also establish a connection with programs like Google Sheets and Excel.

TextBlob is a Python library that functions as an extension of NLTK. When using this intuitive interface, beginners can easily perform tasks like part-of-speech

tagging, text classification, and sentiment analysis. This library tends to be more accessible to those who are new to NLP than other libraries.

Stanford Core NLP was created and is currently being maintained by those at Stanford University who are working on NLP. Users must install the Java Development Kit on their computers in order to utilize this Java library. It is ideally suited for carrying out operations like tokenization, named entity recognition, and part-of-speech tagging and provides APIs in practically all programming languages. Core NLP performs well on complex jobs because it offers speed optimization and scalability.

Google Cloud Natural Language API is part of Google Cloud. It incorporates question-answering technology, as well as language understanding technology. This interface offers users a variety of pre-trained models that can be used for performing entity extraction, content classification, and sentiment analysis.

PREPARING AN NLP DATASET

Excellent training data is essential for NLP success. However, what makes data so amazing? The quantity of data is crucial for machine learning (ML) and deep learning in particular. However, you also want to be sure that you didn't sacrifice quality in favour of size. Therefore, when preparing data, the two most important concerns that ML researchers need to address are how to determine the quality of their data and how to know if they have enough data to produce effective findings. These factors come into play whether we use publicly available datasets or conduct our own data collection. Let's examine these two inquiries.

Determining dataset size

Nobody can estimate the number of product reviews, emails, sentence pairings, and questions and answers you will require to get a precise result. For instance, we gathered 100,000 hotel review samples from open sources for our sentiment analysis tool. But there are various approaches to help you identify the size of a dataset that's

adequate for your project. These are techniques put forth by ML expert Jason Brownlee.

Follow someone's example. People are doing NLP projects all the time and they're publishing their results in papers and blogs. Look for similar solutions to give you at least an estimation.

Acquire domain knowledge. Use your own knowledge or invite domain experts to correctly identify how much data is needed to capture the complexity of the task.

Use statistical heuristics. There are statistical techniques for identifying sample size for all types of research. For example, considering the number of features ($x\%$ more examples than number of features), model parameters (x examples for each parameter), or number of classes.

Guesstimate/get as much as you can. These unreliable but still popular methods will get you started. Plus, you likely won't be able to use too much data.

STEPS IN NATURAL LANGUAGE PROCESSING (NLP)

Fig.2: Steps in Natural Language

Natural language generation (NLG)

Natural language generation (NLG) is a technique that uses data to produce meaningful phrases and sentences. Text realization, sentence planning, and text planning are its three phases.

Text planning: locating pertinent information.

Sentence structure: Creating pertinent phrases and establishing the mood of the sentence.

Text realization: Linking sentence structures and plans.

NLG is used in a variety of applications, including voice assistants, chatbots, machine translation tools, analytics platforms, sentiment analysis platforms, and AI-powered transcription tools.

Natural language understanding (NLU)

NLU takes metadata from material and uses it to make machines comprehend and interpret human language. It carries out the following functions- Aids in language analysis in various contexts and assists in converting natural language input into appropriate representations.

PIPELINE OF NATURAL LANGUAGE PROCESSING IN ARTIFICIAL INTELLIGENCE

The NLP pipeline comprises a set of steps to read and understand human language.

Step 1: Sentence segmentation

Sentence segmentation is the first step in the NLP pipeline. It divides the entire paragraph into different sentences for better understanding. For example, "London is the capital and most populous city of England and the United Kingdom. Standing on the River Thames in the southeast of the island of Great Britain, London has been a major settlement for two millennia. It was founded by the Romans, who named it Londinium."

Sentence segmentation yields the following outcome:

"The most populous and capital city of England and the United Kingdom is London."

"London, a major settlement for two millennia, is located on the river Thames in the southeast of the island of Great Britain."

"The Romans established it and gave it the name Londinium."

Step 2: Word tokenization

The sentence is divided into discrete words or tokens by word tokenization. This aids in comprehending the text's context. In tokenizing the statement "London is the capital and most populous city of England and the United Kingdom," the words "London," "is," "the," "capital," "and," "most," "populous," "city," "of," "England," "and," "the," "United," "Kingdom," and so on are broken out.

Step 3: Stemming

Stemming helps in preprocessing text. The model analyzes the parts of speech to figure out what exactly the sentence is talking about.

Stemming normalizes words into their base or root form. In other words, it helps to predict the parts of speech for each token. For example, intelligently, intelligence, and intelligent. These words originate from a single root word 'intelligen'. However, in English there's no such word as 'intelligen'.

Fig.3: Pipeline of NLP in AI

Step 4: Lemmatization

Lemmatization removes inflectional endings and returns the canonical form of a word or lemma. It is similar to stemming except that the lemma is an actual word. For example, 'playing' and 'plays' are forms of the word 'play'. Hence, play is the lemma of these words. Unlike a stem (recall 'intelligen'), 'play' is a proper word.

Step 5: Stop word analysis

The next step is to consider the importance of each and every word in a given sentence. In English, some words appear more frequently than others such as "is",

"a", "the", "and". As they appear often, the NLP pipeline flags them as stop words. They are filtered out so as to focus on more important words.

Step 6: Dependency parsing

Next comes dependency parsing which is mainly used to find out how all the words in a sentence are related to each other. To find the dependency, we can build a tree and assign a single word as a parent word. The main verb in the sentence will act as the root node.

Fig.4: Pipeline of NLP in AI Sentence Segmentation

Step 7: Part-of-speech (POS) tagging

POS tags contain verbs, adverbs, nouns, and adjectives that help indicate the meaning of words in a sentence in a grammatically correct way. Opinions vary regarding what constitutes high-quality data in various application domains. One crucial quality metric in NLP is representational. Representational data quality metrics consider the machine-readability of the text. This comprises the following dataset isswrong formulated data values (same entities with different syntax, like September 4th and 4th of September);

typographical and spelling mistakes;

different spellings of the same word;

co-reference problems (the same person in the text can be called Oliver, Mr. Twist, the boy, he, etc.);

lexical ambiguity (some words and phrases in different contexts can have different meanings, like rose as a flower and rose as got up.);

large percentage of abbreviations;
lexical diversity; and
large average sentence length.

CONCLUSION

Create a precise and automated tagging system that can serve as the foundational element of NLP applications. Neural network approaches are the foundation for the automatic part-speech tagging system, which allows the free texts to be automatically tagged. The study showed several tagger types that can address issues related to language contraction, including Hindi and Arabic part-speech contractions. The new methods tag quickly and accurately while requiring little processing time. Two stages automatic tagging system based SVM, MPL and FRNN are implemented and designed. The proposed system helps to classify words and assign the correct POS for each of them.

The results are greatly encouraging, with correct assignments and recall about 99%. The genetic Algorithm is used to optimize the network variables like the momentum rate and step size. The words disambiguation is solved in Arabic POS taggers. Design and implementation of an automatic tagger that combines each word with its appropriate part of speech and may tag a free text directly. The only file formats on which this work focuses are text files and HTML files. It is therefore desirable to provide a wider variety of file types. It will also be very encouraging if the text can be extracted straight from the webpage. The current job is divided into two phases. VBA scripts were used for the pre-processing portion of the task. In addition, the Neuro Solutions software is used to implement the second stage, which is the processing phase. The phases are combined into one element, which is very helpful in creating a portable system that can be utilized for any other application.

ABSTRACT

This paper presents the design and implementation of a solar powered alternating current motor drive system for efficient water pumping applications. The proposed system integrates solar energy harvesting with a direct current-to-alternating current inverter to drive an alternating current motor for water pumping, catering to remote areas with limited access to the grid. The system comprises solar panels, charge controller, battery bank, direct current-alternating current inverter, and an alternating current motor drive. The solar panels are selected based on the water pumping requirements and geographical location, emphasizing optimal energy harnessing. A charge controller regulates the charging process to prevent overcharging or deep discharging of the battery bank, which serves as an energy storage solution. Deep-cycle batteries are chosen for their suitability in solar applications. A direct current- alternating current inverter is selected to convert the direct current power stored in the batteries into high-quality alternating current power, employing a pure sine wave for enhanced efficiency. By harnessing solar energy and employing an efficient direct current - alternating current inverter, this system contributes to reducing dependence on conventional power sources while

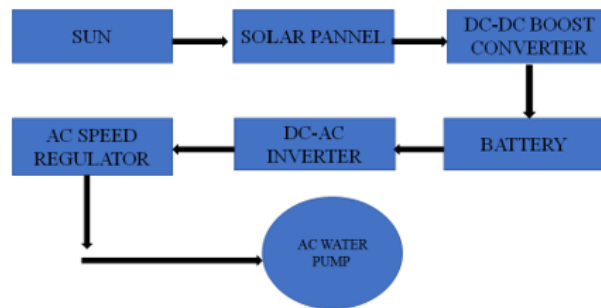

addressing the vital need for water pumping in areas lacking reliable electricity infrastructure.

KEYWORDS

Solar-powered water pumping, Renewable energy, Solar energy Green technology

INTRODUCTION

In recent years, the escalating demand for sustainable and off-grid solutions has fuel the exploration of alternative energy sources for essential applications, such as water pumping. One promising avenue in this quest for eco-friendly and decentralized water supply systems is the integration of solar power with alternating current motor drives utilizing direct current-alternating current inverters. Solar energy, being abundant and renewable, emerges as a compelling choice for powering critical applications like water pumping, where accessibility to conventional electricity sources is limited. This shift towards solar-powered alternating current motor drives, facilitated by direct current - alternating current inverters, embodies a sustainable and efficient solution that aligns with the global transition towards cleaner and greener technologies. As we delve into the intricate design and implementation of a solar-powered alternating current motor drive system using a direct current- alternating current inverter for water pumping, it becomes apparent that this technology holds the promise of transforming water access in remote regions. This paper explores the various components, design considerations, and potential benefits of such a system, underscoring the importance of renewable energy in addressing pressing global issues related to water access and energy sustainability.

SOLARPANEL

Solar panels consist of multiple photovoltaic cells, typically made from silicon-based materials that convert sunlight into direct current electrical energy through the photovoltaic effect. These panels come in various types, including mono crystalline, polycrystalline, and thin-film, each with its own efficiency and cost considerations.

DIRECT CURRENT TO DIRECT CURRENT BOOST CONVERTER

The direct current - direct current boost converter serves the crucial purpose of stepping up the voltage from the solar panels to meet the required charging voltage of the battery bank. As solar panel output varies due to changing environmental

conditions, the boost converter ensures that the energy harvested is consistently elevated to an optimal level, addressing voltage disparities and maximizing power efficiency.

BATTERY

The battery serves as a crucial energy storage component and ensuring a continuous power supply during periods of low sunlight or at night. This section explores the key considerations and characteristics of batteries.

DIRECT CURRENT TO ALTERNATING CURRENT INVERTER

Direct current to alternating current inverter in a solar-powered alternating current motor drive system for water pumping is a critical component that facilitates the conversion of direct current - from the battery bank into alternating current for driving the alternating current motor. This section outlines key considerations and characteristics of a direct current to alternating current inverter

ALTERNATING CURRENT SPEED CONTROL REGULATOR

Alternating current speed control regulator in a solar-powered alternating current motor drive system, utilizing a direct current - alternating current inverter for water pumping, is essential for optimizing the performance, efficiency, and control of the system. This section outlines key considerations and characteristics of an alternating current speed control regulator

ALTERNATIG CURENT WATER PUMP

Alternating current water pump designed for solar-powered systems is a key component in providing reliable water access, especially in off-grid or remote locations. Harnessing energy from solar panels, the system utilizes an alternating current motor and a direct current - alternating current inverter to drive the water pump efficiently.

DRAWBACKS IN EXISTING SYSTEM

Initial Cost,

Energy Storage Limitations

Land Use Requirements

Intermittent Power Supply

EXISTING METHODS

Existing methods aim to harness renewable energy efficiently while addressing the unique challenges associated with water supply in off-grid or remote locations. Below are some key aspects of existing methods used in various components Photovoltaic System Design, Battery Technology, direct current - alternating current Inverter Efficiency, alternating current Motor Drive Control, Monitoring and Maintenance

OBJECTIVES

Enhance the overall energy efficiency of the system by optimizing the conversion of solar energy into electrical power, minimizing energy losses in the direct current - alternating current inverter, and improving the efficiency of the alternating current motor drive.

Implement a control system that allows for variable speed operation of the alternating current motor, enabling the water pumping system to adapt to varying water demand levels and changing sunlight conditions.

Ensure a reliable and continuous water supply by integrating energy storage through an efficient battery bank, allowing the system to operate during periods of low sunlight or at night.

PROPOSED SYSTEM

Optimize the design of the photovoltaic system by selecting high-efficiency solar panels, incorporating advanced solar tracking mechanisms, and implementing an efficient tilt angle strategy. This ensures maximum solar energy capture throughout the day.

Utilize state-of-the-art direct current - alternating current inverter technology with high efficiency and advanced features. Integration of Maximum Power Point

Tracking (MPPT) algorithms ensures optimal power conversion, enhancing the overall performance of the water pumping system.

Select advanced battery technologies with high energy density, long cycle life, and rapid charging capabilities. This ensures reliable energy storage, allowing the water pumping system to operate during extended periods without sunlight.

ADVANTAGE OF PROPOSED SYSTEM

The integration of advanced photovoltaic technology, efficient direct current - alternating current inverters, and intelligent motor drive control algorithms maximizes energy capture and conversion, leading to overall improved energy

RESULT

This sustainable solution reduces reliance on grid electricity, lowers operational costs, and promotes environmental conservation. By levels, the system achieves high energy efficiency and cost saving efficiently converting solar energy into the required voltage and current.

CONCLUSION

The solar-powered AC motor drive system utilizing a DC-AC inverter for water pumping presents a sustainable and efficient solution for off-grid and remote water supply needs. The integration of advanced photovoltaic technology and high-capacity energy storage brings forth several noteworthy outcomes.

SMART SOLAR GRASS CUTTER MACHINE USING IOT

ABSTRACT

Over the current few years, the application on solar power has exponentially grown. Human beings are seeking out transforming the prevailing non-renewable resources for electricity infrastructure everyday easy renewable power supply. For mower it has been always used everyday maintain the garden but the traditional diesel lawn mowers are a risk everyday society. The presence of considerable sunlight in garden in a key prospect that can be applied in want of mankind. Extracting sun energy from sun and using it everyday presence an automated garden mower is the primary purpose of our task. Sun power is used everyday rated batteries, growing the common operation time and place. The garden mower starts from the boundary of a garden and concentrically action daily the centre and cleans the entire patch. It has been discovered effective and green in the operation compared with the traditional garden mower using fossil fuels. The IOT based solar mower is an innovative solution and solar energy to create an efficient and eco-friendly way to maintain lawns and gardens.

KEYWORDS

Solar power application, Automated Garden mower, Renewable energy, IoT-based solution, Eco-friendly maintenance.

INTRODUCTION

The IOT- based solar powered lawn mower robot is a designed to provide an easy and environmentally friendly way to manage lawns and gardens. The robot Combines the power of the IOT with solar energy to deliver smart mowing. A solar lawn mower is an automatic lawn mower powered by solar energy. It cuts the grass at very high speeds. A solar lawn mower is an automatic lawn mower that uses solar energy. He also sees obstacles on the way as a change of action.

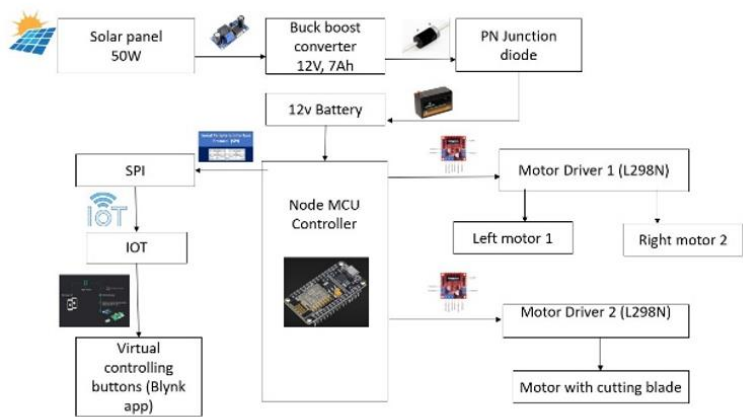

METHODOLOGY

EXISTING METHODOLOGY

The lawn mowers can eliminate obstacles and be operated from any direction with the movements of the remote camera, which is mounted at the highest point of the vehicle and sends signals to the user remotely. The system uses a 6V battery to power the motor and mower. The devices also use solar panels to charge the battery, eliminating the need for additional batteries. Lawn mower and car engines are connected to a series of microcontrollers that control all the engines. It is also equipped with ultrasonic sensors to track objects. This accelerometer is a sensor that detects the direction of the hand in various axes such as x, y and z. In the concept model, the accelerometer is used only to detect the x and y axes to generate the commands needed to support the robot. Next internet foundation requires Raspberry Pi, tablet and USB camera (FING) and virtual network computing (VNG) platforms.

PROPOSED METHODOLOGY

Users can monitor the operation of the lawn mowers and receive real-time updates from the IOT platform. They can control the mowers, start or stop mowing, adjust settings and plan mowing from anywhere with an internet connection. The machine is equipped using IOT sensors and connections that allow it to communicate with other devices and be controlled remotely via a smartphone app or web interface. Using IOT technology, lawn mowers can improve their routes, energy consumption and mowing patterns, making mowing more efficient and reducing maintenance costs.

MAIN COMPONENTS

SOLAR PANEL

A sun-oriented board alludes to a photovoltaic module, a solar hot water board or a gather of sun oriented photovoltaic (PV) modules that are electrically associated and fortified to the bolster. Photovoltaic modules a bundled and interconnected components of sun powered cells. Sun based can be utilized as huge photovoltaic devices generate and give power for the commercial and residential utilize. Each

module determines is appraised agreeing to the DC output voltage of the standard test condition (STC), usually between 100 and 320 watts. The productivity of the module giving the same yield a 230-watt module with 16% proficiency.

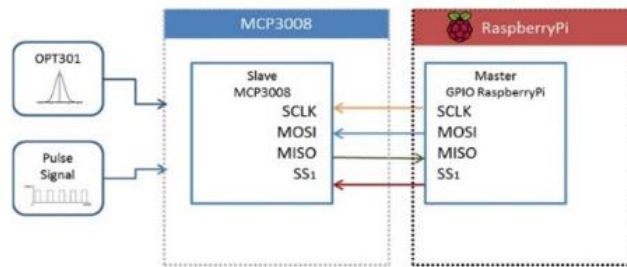

There re are a few suns oriented boards that are more effective 19%. A sun powered module can as it were creating a little sum of power. Most establishments have more than one module. Photovoltaic frameworks as a rule incorporate sun powered boards or structure as an inverter and in some cases batteries and / or sun-oriented trackers and a phone association.

BATTERY

A battery may be a gadget that changes chemical substances directly in to electrical vitality. It incorporates an arrangement of voltaic cells. Each voltaic cell has two half cells associated in arrangement with a conductive electrolyte containing anion and cations. Half way through the cell is an terminal called the anode are negative anode, through which the electrolyte and anions particle move. The other half of the cell contains the electrolyte and the electrode to which cations (emphatically charged particles) move called the cathode or positive terminal. Within the redox responses that powers the battery, cations are decreased at the cathode (electrons are anode). The anodes wear not touch each other but they electrically associated through an electrolyte. A few batteries utilize two half cells with distinctive electrolyte. Separators between half cells permit particles to stream but anticipate electrolytes from blending.

SERIAL PERIPHRAL INTERFACE (SPI)

SPI bus is a simple wire serial communication interface used by many microprocessor / microcontrollers peripheral chips to enable controller and peripheral communications. Although it is specifically designed for communications between main processor and peripheral devices, it is also possible to connect two processor via SPI. The SPI bus operates in full duplex mode (that is signal carrying can be sent in both directions simultaneously) and is synchronous data link configured with a master / slave interface that support up to 1 Mbaud or Mbps. Single master protocol and multi-master protocol can be used in SPI. But multi-master buses are rarely used look awkward and are often limited to a single auxiliary device.

NODEMCU

NodeMCU V3 is an open-source firmware and microcontroller that plays an important role in creating IOT products with a few lines of code. The many GPIO pins on the board allow us to interface the board with other devices and create PWM, 12C, SPI and UART serial communications. The interface of the module is generally divided into two parts: Firmware and Hardware; the previous runs on ESP8266 Wi-Fi and the last mentioned is based on ESP-12 module. The firmware is based on Lua, an easy to learn coding language that provides a simple programming environment

with a fast-coding language that connects you to the renowned developer community.

L293D MOTOR DRIVER IC

The L293D H-bridge driver is the foremost commonly utilized driver in bi-directional driving applications. The L293D IC allows DC engines to be driven in both directions. L293D could be a 16 stick IC that can control the operation of two DC motors at a same time in one course. This implies you'll be able to control two DC engines utilizing 1293D IC. Since there are two run expansive engines that are little and calm. There are numerous ways to make H-bridge engine control circuits, such as utilizing transistors, hand-off and L293D / L298D

BUCK BOOST CONVERTER

A step-down converter could be a DC-DC converter (too called as chopper) whose yield voltage sufficiency is more noteworthy or less than the input voltage sufficiency. It is utilized to step up the DC voltage, comparable to a transformer in an AC circuit. It is identical to a flyback converter utilizing an inductor rather than a transformer. The two diverse topologies are called Buck-Boost converter.

BLYNK APP

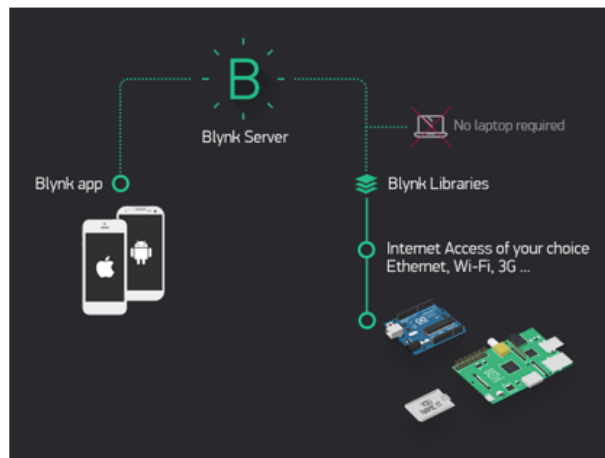

Blynk is outlined for the web of things. It can remotely control gadgets, see sensor information, store information, see information, and do numerous other cool things.

There are three primary components in the system:

BLYNK APP – It permits you to make staggering interfacing for your ventures utilizing variuos widgets we provide.

BLYNK SERVER – It permits for all communications between the smartphones and the gadgets. You'll utilize cloud or run you possess Blynk server locally. Its open-source, can effortlessly oversee thousands of gadgets, and can be built from the Raspberry pi.

BLYNK LIBRARIES – For all well-known equipment stages empower all communications with the server and perform all input and yield commands.

RESULT AND DISCUSSIONS

The project aims to use renewable energy such as solar power equipped with various tools to cut and harvest the grass. The DC motor is powered by battery stored by the solar panel. The solar panel is mounted on the model and charged if the system does not work, and the charge is transferred to the battery via circuit. The solar powered lawn mower is used both during day and night. Thus, the IOT with solar energy to deliver smart mowing. A solar lawn mower is an automatic lawn

mower powered by solar energy and it cuts the grass. It also sees the obstacles as a way of changing

CONCLUSION

Since the solar lawn mowers is a device frequently used in large parks and gardens, we made this project to make it interesting in the region. We produce the solar lawn mower and taking into the account all the factors affecting it we conclude that the lawn mower has high efficiency of more than 90% because it uses solar as an input.

ABSTRACT

Farmers are coined as backbone of India because Indian Economy mainly based on farmers without them, it will be in critical stage. Indians will proudly say India is famed for agriculture but at the same time farmers are facing many challenges during growing of crops in their land. Now a days, the farmers have loss in their crops and sugarcane yielding and they couldn't get the damage amounts. To overcome this issues, the farmers can insure their crops. If any harms occur in the crops they can claim through this website. Many insurance company's are tie up with us. They will check the details and if all data are correct, the company will provide the loss amount to the farmers. The main intent of this project is developing a website especially for farmers to provide the insurance. Before cultivating the crops, the farmer should insure the land and their crops. If any impair occurs, they will upload the affected crop images in the website. After the affirmation by the insurance company, the amount will be credited to the farmer's account. The Agricultural Insurance Management System (AIMS) is a comprehensive solution designed to address the challenges faced by the agricultural sector in managing and mitigating risks associated with crop and livestock production. This system leverages advanced technologies to streamline the insurance process, enhance data accuracy, and facilitate efficient claim settlements. AIMS incorporates a user-friendly interface that allows farmers, insurance agents, and administrators to interact seamlessly. The

system employs cutting-edge data analytics to assess various factors affecting crop and livestock yield, including weather patterns, soil conditions, and historical performance. This enables accurate risk assessment and fair premium calculation. AIMS utilizes data from multiple sources, including satellite imagery, weather stations, and historical data, to assess and analyze risks associated with agricultural activities. This helps insurance providers in determining appropriate coverage and premiums."The system offers an intuitive interface for farmers to input relevant information about their crops and livestock. Insurance agents can easily navigate information about their crops and livestock. Insurance agents can easily navigate through the system to assist farmers in selecting suitable insurance plans.

INTRODUCTION

In India, around 60% people depending on agriculture. India is famous for agriculture where Indian people will export more agriculture products to other countries, so India also popularly named as an agricultural country. In India among all suicides cases registered Farmer suicides will be around 11.2% of all suicides. The reasons for farmer suicides may be due to floods, family problems, due to financial problems due to unavailable water resources, sometimes due to no time whenever loss happened to a farmer. In India many suicides cases are registered in every year but at least 1 to 2 percent suicide cases of farmers in every state. If we observe the 4 years among one lakh people suicides cases minimum ten thousands suicide cases are farmers. The author surveyed different years of suicides cases among which many farmer suicides cases are registered in every year. The intention of the author is to avoid or to prevent suicides cases of farmers by developing this software application. Agricultural management is a complex and dynamic field that faces numerous challenges, including unpredictable weather patterns, market fluctuations, and the constant need for resource optimization. In light of these challenges, the integration of advanced technologies becomes imperative to ensure the sustainability and resilience of agricultural practices. One crucial aspect in this

regard is the development of Agricultural Insurance Management Systems, which have emerged as a pivotal tool to mitigate risks and provide financial security to farmers. The Agricultural Insurance Management System is a comprehensive solution that leverages technology to streamline the insurance process for agricultural operations. By integrating data analytics, remote sensing, and satellite imagery, these systems assess and quantify risks more accurately. This enables insurance providers to offer tailored and cost-effective policies, ensuring that farmers receive adequate coverage based on the specific challenges they face in their geographical region and farming practices. The agricultural sector is inherently vulnerable to various uncertainties, ranging from natural disasters such as droughts, floods, and storms to market volatility and crop diseases. These uncertainties can lead to substantial financial losses for farmers, impacting their livelihoods and threatening food security on a broader scale.

RELATED WORK

The agricultural sector plays a pivotal role in sustaining global food security and economic stability. With the increasing global population and changing climatic conditions, the need for efficient and sustainable agricultural management systems has become more pronounced. Several research efforts have been directed towards the development of advanced technologies to enhance agricultural practices and ensure optimal resource utilization. One notable area of related work focuses on precision agriculture, where cutting-edge technologies such as remote sensing, geographic information systems (GIS), and global positioning systems (GPS) are integrated to provide farmers with real-time data on crop health, soil conditions, and weather patterns. These technologies enable farmers to make informed decisions regarding irrigation, fertilization, and pest control, leading to improved crop yields and resource efficiency. Another significant aspect of agricultural management systems is the integration of data analytics and machine learning. Researchers have explored the use of machine learning algorithms to analyze large datasets generated

from agricultural operations. These algorithms can predict crop yields, identify disease outbreaks, and recommend optimal planting schedules, contributing to better decision-making processes for farmers. Furthermore, the development of smart farming equipment and autonomous vehicles has garnered attention, as these technologies can automate labor-intensive tasks and increase overall operational efficiency.

PROPOSED SYSTEM

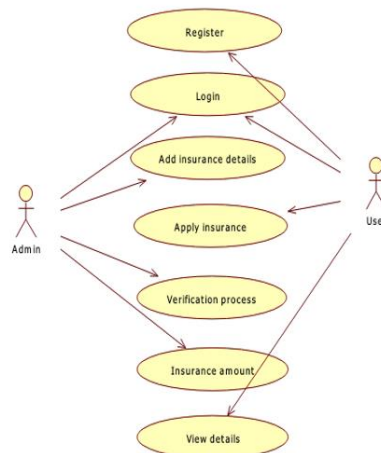

The proposed system is developed after a detailed study about the requirements requested by the user. Proposed system is a computerized one, where all the limitations of manual system are compensated. Insurance details of agricultural insurance management system have simplified the working information and make a user friendly environment, where the user is provided with much flexibility to manage effectively. It helps the admin to generate desirable reports more quickly and also to produce better results. The main theme of the project is developed to the farmers to provide the proper insurance. Farmers will get loss amount immediate from the insurance company. The company can quickly take action when the farmers apply the insurance using this system. So the farmer will get the amount after the verification process through online.

IMPLEMENTATION

The implementation of an Agricultural Insurance Management System involves a systematic approach to address the unique challenges faced by the agricultural sector. To begin with, a comprehensive needs assessment is conducted to identify specific risks prevalent in the target region, considering factors such as climate, crop varieties, and historical loss data. Engaging key stakeholders, including farmers, insurance providers, and technology partners, is essential to ensure the system aligns with the diverse needs of the agricultural community. Subsequently, a robust technology infrastructure is established to support data collection, storage, and

analysis. The integration of various data sources, such as satellite imagery and weather stations, creates a comprehensive database for risk assessment and policy customization. Advanced risk modeling and analytics, powered by machine learning algorithms, play a pivotal role in predicting potential risks and losses. Moreover, attention to scalable and secure technology solutions ensures the system's adaptability to future growth and compliance with data security standards. The successful implementation of this Agricultural Insurance Management System not only mitigates financial risks for farmers but also enhances the overall resilience of the agricultural sector in the face of uncertainties.

Use Case Diagram:

A use case diagram at its simplest is a representation of a user's interaction with the system that shows the relationship between the user and the different use cases in which the user is involved. In this context, a "system" is something being developed or operated, such as a web site. The "actors" are people or entities operating under defined roles within the system. The admin can login the system using his/her username and password. And the admin can add the insurance details like insurance name, rules, company details, etc. There is registration form available where new user can create their account by providing required information to the system. The registration form details are like name, email, gender, mobile number, address, and etc. These details are stored in the database. And then can getting to the

username and password in the system. User can login in the system using his/her username and password. User or Farmer can apply the insurance, after successful login to the system. After successfully verified by admin, the farmer can claim his/her insurance amount. The admin can view the user insurance applied details.

RESULTS

The Agricultural Insurance Management System is a comprehensive solution designed to streamline and enhance the management of agricultural insurance processes. This system incorporates user authentication and authorization, enabling secure access for farmers, insurance agents, and administrators. It facilitates policy management, allowing agents to create and administer various insurance policies tailored to the unique needs of farmers. The system integrates risk assessment tools, leveraging weather data and historical information to calculate premiums accurately. With efficient claim processing, automated notifications, and detailed reporting, the system ensures effective communication between stakeholders. Its mobile accessibility, payment integration, and adherence to regulatory standards contribute to a reliable and scalable platform, ultimately optimizing the agricultural insurance experience.

CONCLUSIONANDFUTUREWORK

This project entitled as “Agricultural Insurance Management System” has been developed to satisfy all the proposed requirements. The process of recording details about insurance is more simple and easy. The system reduces the possibility of errors to a great extent and maintains the data in an efficient manner. User friendliness is the unique feature of this system. The system generates the reports as and when required. The system is highly interactive and flexible for further enhancement. The coding is done in a simplified and easy to understandable manner so that other team trying to enhance the project can do so without facing much difficulty. The documentation will also assist in the process as it has also been carried out in a

simplified and concise way. In future the web application will develop in the android application. The farmers can easily insure their land details through this app. Farmers will get the immediate notifications from the insured company. And we will attach the feedback from also.

ezhilkumaran.20eee@sonatech.ac.in, hemachandran.20eee@sonatech.ac.in

ABSTRACT

The primary goal of the wireless black box project is to create a vehicle data recorder capable of being installed in any car globally. This design philosophy prioritizes minimal circuitry. The wireless black box is intended to log all vehicle accidents and furnish supplementary data including temperature, location, vibration, and alcohol levels. It is a device that can also store and display parameters. In the event of an accident, police, hospitals, families, vehicle owners, etc. will be contacted by the system built into the vehicle. Messages will be sent to a list of mobile phone numbers, such as emergency numbers. Our system utilizes a range of sensors, such as temperature sensors and vibration sensors, to continuously monitor the vehicle's surroundings and detect vibrations indicative of accidents. Furthermore, we incorporate an alcohol sensor situated on the steering wheel to assess the driver's level of sobriety. Gyroscope sensors are used to indicate pitch during an accident. GSM module and GPS module are some of the components used in this project to help complete the output.

INTRODUCTION

In our contemporary society, the steady growth of the population correlates with an increasing number of vehicles traversing roads and highways. This surge in vehicular traffic significantly raises the likelihood of accidents and traffic congestion,

frequently leading to delays in promptly accessing assistance for those affected. Traffic accidents account for the majority of fatal accidents worldwide[1]. This situation causes material damage and loss of life due to the inability to use security features immediately. It is inevitable that accidents can be prevented completely, but their effects can at least be reduced[2-4]. In overpopulated countries like India, people die every day due to accidents and poor facilities. These people can be saved if medical facilities are provided in time. It's common for delays to hinder the timely notification of family members, ambulance services, or law enforcement, thus impeding swift assistance to victims[5-7]. To effectively assist the injured, it's crucial to promptly pinpoint the incident location through location tracking and then promptly send messages to the relevant individuals or emergency services.

PROPOSED SYSTEM

The setup integrates four primary sensors: a temperature sensor (LM35), a vibration sensor, a gas sensor (MQ3), and an accelerometer (ADXL345), all contributing input data. Output channels through an LCD display, GPS module (GPS6MV2), and GSM module (SIM800L). A

motor serves to indicate car motion. The sensors' threshold detection levels are preset initially. Once activated, the device showcases "Wireless Blackbox" and awaits user input surpassing the sensor thresholds. Upon detection, it promptly dispatches an SMS detailing the accident location to a previously registered mobile number.

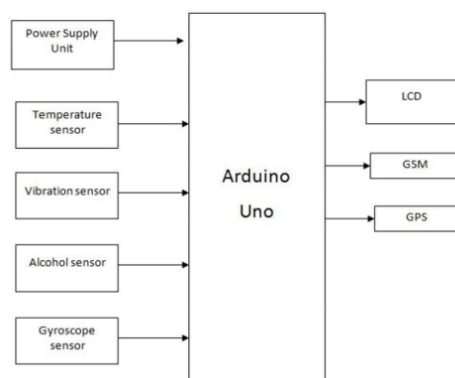

Figure 1. Block diagram of Blackbox system

Arduino Mega 2560

The Arduino serves as the central board, utilizing the ATmega328 microcontroller as its primary controller to oversee circuit operations[8-9]. Renowned as an open-source microcontroller platform, Arduino is exceptionally suitable for crafting digital devices and interactive tools capable of interfacing with a diverse range of components including LEDs, LCD displays, switches, GSM modules, flame sensors, buzzers, and more. It offers an extensive array of features, including 54 digital input/output pins, 16 analog inputs, 4 UARTs, a 16 MHz crystal oscillator, USB connection, power jack, ICSP header, and a reset button. There are many ways for the Arduino Mega2560 to communicate with a computer, another Arduino, or another microcontroller.

Figure 2. Arduino Mega 2560

Figure 3. Schematic Diagram

GSM module

The GPS Module NEO-6MV2 serves navigation purposes, primarily determining the device's global location and outputting latitude and longitude data. It's part of a standalone GPS receiver family featuring the high-performance ubox6 positioning engine, known for its efficiency and effectiveness. These receivers offer multiple connections within a compact 16 x

12.2 x 2.4 mm package. With its compact architecture, various power supply options, and memory configurations, the NEO-6 module is ideal for battery-powered devices and cost-effective location tracking applications. Additionally, to calculate distance between the sensor and an object, the sensor measures the time taken for sound to travel from the transmitter to the receiver upon contact[10].

Figure 4. GSM module

TEMPERATURE SENSOR

The Temperature sensor LM35 is engineered to function effectively within a temperature range spanning from 55°C to 150°C. Its output voltage exhibits a linear proportionality to the Centigrade temperature being measured. To illustrate, when the temperature reads 25°C, the output voltage from the LM35 sensor would be 250 mV. Notably, the LM35 sensor's inherent linearity eliminates the need for external calibration, streamlining temperature measurement processes.

Furthermore, the LM35 operates flexibly within a supply voltage range of 4 to 30 volts.

Figure 5. Temperature Sensor

ALCOHOL SENSOR

The Alcohol sensor MQ-3 is engineered to identify the presence of alcohol gas within a concentration range spanning from 0.04 mg/L to 4 mg/L. This sensor produces an analog resistive output that correlates with the detected alcohol concentration. When it comes to vehicles, the MQ-3 alcohol sensor can be utilized to create a system that senses the presence of alcohol vapors in the vicinity. This is particularly relevant for applications such as alcohol ignition interlock systems, which are designed to prevent a vehicle from starting if the driver is under the influence of alcohol.

Figure 6. Alcohol Sensor

VIBRATION SENSOR

A vibration sensor for vehicles is a device designed to detect and measure vibrations or oscillations in a vehicle's environment. Vibration sensors are used to monitor the health of the engine by detecting irregularities or abnormalities in vibration. Bad vibrations could be a sign of engine misfire, imbalance, or other

problems. Vibrations from tires can be monitored to assess tire health, balance, and potential issues like uneven wear or imbalances. Vibration sensors are integrated into anti-theft systems to detect unauthorized attempts to move or tamper with the vehicle.

Figure 7. Vibration Sensor

GYROSCOPE SENSOR

A gyroscope sensor measures the rate of angular displacement or rotation around specific axes. It helps determine the vehicle's orientation and changes in orientation over time. Gyroscope sensors for vehicles can be based on various technologies, including mechanical (gyroscopic wheels), MEMS (Micro-Electro-Mechanical Systems), or fiber optic gyroscopes. Gyroscopes typically measure angular velocity around three axes: pitch (rotation around the lateral axis), roll (rotation around the longitudinal axis), and yaw (rotation around the vertical axis).

Figure 8. Gyroscope Sensor

LCD

An LCD 16*2 display is a common module with 16 characters per line and 2 lines. It interfaces with microcontrollers to display alphanumeric characters, making it popular in electronic projects for showing data or messages. It's versatile, compact, and easily readable, suitable for various applications.

Figure 9. LCD

DC MOTOR

A DC motor is an electric motor that operates on DC power and is commonly used in a variety of applications, including vehicle blackbox system. DC motors can be versatile components in vehicle blackbox systems, providing the necessary mechanical movements and adjustments required for optimal operation and data collection.

Figure 10. DC Motor

METHODOLOGY

The project proposal and its extensions are segmented into two main components: hardware architecture and software details. During the hardware architecture phase, the circuit design was formulated, and a project prototype was constructed.

Conversely, in software development, the complete prototype was operationalized using programming codes.

RESULT AND DISCUSSION

A fully operational road traffic black box model with SMS notification capabilities has been successfully developed to detect and alert about traffic accidents. This system integrates an Arduino Mega, GPS tracking system, and GSM module, all tailored for vehicle accident detection and reporting. Its primary goal is to swiftly relay critical information to emergency responders, acknowledging that the time gap between an accident and receiving medical attention can significantly impact outcomes. Implementing this system enhances security compared to having no security measures. By utilizing a GPS module to pinpoint the accident location and a GSM module to send SMS alerts to predetermined contacts, the system ensures timely dissemination of crucial information following an accident.

Figure 11. working model

CONCLUSION

The main goal of our project was to design a black box system that monitors and alerts in the event of car accidents. By introducing alert messages, the system effectively overcomes the limitations of existing solutions. We ultimately developed

an automated black box using sensors, GSM, and GPS tracking to monitor and warn of traffic accidents, providing an intelligent resolution to this problem. Looking ahead, integrating ultrasonic sensors will enable us to detect nearby vehicles, enhancing safety measures. Moreover, integrating the system with the vehicle's airbag system will further protect occupants from potential collisions with interior objects such as the steering wheel or windows.

ABSTRACT

There is a growing need for automatic identification, positioning and maintenance of logistics equipment as a key source of information to ensure supply chain security and control. This has led to the emergence of smart logistics zones, which play an important role in facilitating transportation and production processes. This paper presents a method for identifying smart logistics zones and reports two RFID-based applications to demonstrate its practicality. An example requires standard products in the automotive industry to be tagged with RFID. This case study show RFID technology can be effectively used to track and control samples to improve overall logistics efforts in the automotive industry.

INTRODUCTION

The utilization of RFID asset tracking offers cost-effective and efficient asset management solutions. Utilizing Radio Frequency Identification, it operates through radio waves to automatic the process of tracking and locating physical assets. Using RFID tags containing relevant data such as name, condition, quantity, and location to assets, organizations can streamline their asset management processes. With the onset of the pandemic, there has been a heightened awareness and reliance on touchless technologies, making RFID asset tracking an increasingly valuable solution for expedited and contactless asset management. RFID technology boasts

remarkable versatility, finding utility across various business sectors. It serves a spectrum of purposes, ranging from overseeing manufacturing procedures to maintaining and inspecting equipment. Moreover, RFID facilitates asset management and enables seamless tracking of goods throughout the distribution process.

By attaching RFID tags to merchandise, employees can seamlessly conduct inventories using handheld readers that transmit data directly to the company's servers or databases. This eliminates the need for manual data entry, streamlining operations and improving overall efficiency

#include <ESP8266WiFi.h>
#include <SPI.h>
#include <RFID.h>
#include "FirebaseESP8266.h" // Install Firebase ESP8266 library
#define FIREBASE_HOST "https://logisticsrfid-default-rtdb.firebaseio.com/" //Without
http:// or https:// schemes
#define FIREBASE_AUTH "64vyaQndnUrHA5wmtGdkRHE20ccnGXdeGi8nG1ug"
RFID rfid(DB, D0); //D8:pin of tag reader SDA, D0:pin of tag reader RST
unsigned char str[MAX_LEN]; //MAX_LEN is 16: size of the array
const char ssid[] = "Wifi Name";
const char pass[] = "Wifi Password";
String uidPath = "/";
//Define FirebaseESP8266 data object
FirebaseData firebaseData;
void connect() {
  Serial.print("checking wifi...");
  while (WiFi.status() != WL_CONNECTED) {
    Serial.print(".");
    delay(1000);
  }
  Serial.println("\n connected!");
}
void setup()
{
  Serial.begin(115200);
  WiFi.begin(ssid, pass);
  SPI.begin();
  rfid.init();
  connect();
  Firebase.begin(FIREBASE_HOST, FIREBASE_AUTH);
  Firebase.reconnectWiFi(true);
}
void pushProduct (String temp) //Function to check if an identified tag is registered to
allow access
{
  Serial.println("PUSHING PRODUCT ID: "+temp);
  Firebase.setInt(firebaseData, uidPath+"product/"+temp,0);
}
void loop() {
  if (rfid.findCard(PICC_REQIDL, str) == MI_OK) //Wait for a tag to be placed near the
reader
  {
    Serial.println("Card found");
    String temp = ""; //Temporary variable to store the read RFID number
    if (rfid.anticoll(str) == MI_OK) //Anti-collision detection, read tag serial number
    {
      Serial.print("The card's ID number is : ");
      for (int i = 0; i < 4; i++) //Record and display the tag serial number
      {
        temp = temp + (0x0F & (str[i] >> 4));
        temp = temp + (0x0F & str[i]);
      }
      Serial.println(temp);
      pushProduct(temp); //Check if the identified tag is an allowed to open tag
    }
    rfid.selectTag(str); //Lock card to prevent a redundant read, removing the line will make
the sketch read cards continually
  }
  rfid.halt();
}
```

SYSTEM BLOCK DIAGRAM

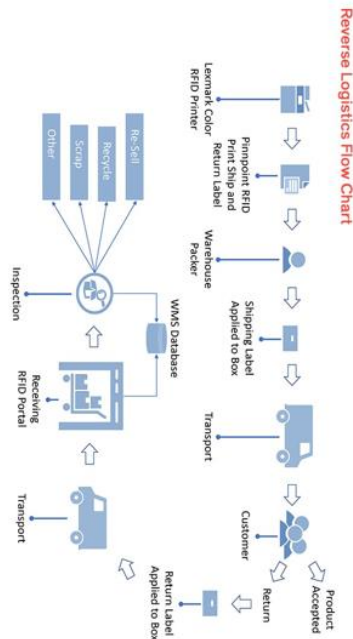

Fig 2. System block diagram

NodeMCU

Fig 3. NodeMCU

NodeMCU is a freely available firmware designed for open source prototyping boards. The name is derived from a combination of "node" and "MCU" (microcontroller unit). It's essential to note that Rather than the development kits linked to it, "NodeMCU" is primarily used for the firmware itself. The firmware, along with the prototyping board designs, is openly accessible. NodeMCU integrates

with many open sources such as Launceston and SPIFFS. Due to limited usage, users need to choose the appropriate model and calculate the customized firmware according to their work. It also now supports 32-bit ESP32 microcontrollers. The power supply consists of power supplies designed as two-in-line (DIP) type. This board combines a USB controller with a small board containing a microcontroller unit (MCU) and antenna. The purpose of DIP is to simplify breadboard prototyping. NodeMCU is the first result of ESP8266's ESP-12 module, which combines Wi-Fi capability with Tensilica Xtensa LX106 core and is widely used in IoT applications.

RFID Reader

Fig 4.RFID reader

RFID systems utilize internal antennas to emit radio waves, enabling the retrieval of signals from RFID tags. In more sophisticated setups, they wirelessly connect to antennas to receive information. Typically, RFID readers are mobile, providing users with the flexibility to move them to different locations. However, they can also be fixed, such as when mounted on tall poles to cover large areas like warehouses. These readers measure data in real time and transfer it to the software system where it will be stored and used when necessary.

RFID readers employ electromagnetic fields to

automatically detect and monitor compatible RFID tags. These tags hold distinct electronically stored data, which is then retrieved by the RFID readers. Widely utilized across various industries, RFID tags are particularly prevalent in security applications due to their versatility and effectiveness in identification and tracking processes.

Active RFID asset tracking systems are equipped with their own power source, typically a battery, enabling continuous signal transmission. These battery-powered tags are commonly utilized in real-time monitoring applications like vehicle tracking and charging processes. Active RFID tags can cover distances of up to approximately 150 meters, depending on the tag's frequency, but they generally come at a higher cost compared to passive RFID systems.

Passive RFID asset tracking, on the other hand, offers flexibility by allowing users to add or remove RFID readers as needed. These tags do not possess an internal power source and rely on RFID readers or antennas for power. Passive RFID systems are widely used in inventory tracking, supply chain management and access control. Although they have a shorter signal range compared to active RFID systems, passive tags are smaller, lighter, and boast a longer operational lifespan. Moreover, they are a more economical option compared to their active counterparts.

Semi-passive RFID tags combine elements of both active and passive systems, featuring internal batteries alongside an antenna and RFID chip. Although their signals are lower than other brands, additional batteries enable additional features such as real-time monitoring and sensor operation..

RFID Tags

RFID tags are part of an RFID device tracking system that uses smart barcodes to identify products. These tags utilize radio frequency technology, with radio waves facilitating the transmission Information is sent from the paper to the reader and then to the RFID computer program. Paper is also known as RFIDchip.RFID tags are attached to each device and continue to transmit data to the antenna, which can be

combined with or detached from the reader.. These tags have the capacity to store extensive information, ranging from basic serial numbers to detailed data such as manufacturing dates, condition, temperature, location, movements, and storage specifications. Essentially, any pertinent information crucial to the organization that can be digitized has the potential to be stored on an RFID tag for further processing.

Fig 5. RFID tag

PROTOTYPE

RESULT AND DISCUSSION

Advances in logistics and logistics are allowing many companies to achieve higher levels of shipping, receiving and order accuracy. These advancements also increased product accuracy, increased order speed by almost 30 percent, and reduced labor costs by 30 percent.

RFID technology in the literature, evidenced by the high increase in research results in recent years, especially between 2003 and 2020.

On future research directions. RFID in logistics. "Localization" appears to be a less researched aspect of RFID, indicating the need for more research in this area. From perspective, the application of RFID technology in transportation is concentrated in developing countries, especially in EU countries (57 items) and Asia (51 items), while developing countries such as South America, Africa and Oceania receive less attention. . Therefore, future research may focus on investigating these unnamed areas.

In summary, although this article does not show new research results, its research is based on the analysis and integration of existing articles in the literature collected from many recent studies on the use of RFID in logistics. However, this study has limitations, including its reliance on the Scopus database; Future research could address this issue by joining other databases such as Web of Science for further analysis. In addition, not including detailed information about methods, techniques and data analysis is a choice made by the authors in order to preserve the brevity of the article, and tabsis with these groups will increase the depth and breadth of the study.

CONCLUSION

RFID technology has many advantages, many of which can now be found in existing products. In addition, it is expected that the results will gradually improve with the continuous development of technology. To fully understand the advantages of RFID technology in the future, it is recommended that you start using it immediately. This technology holds great promise for the logistics industry and the maritime industry.

It is recommended to integrate RFID with hospital information (HIS) and electronic health records (EHR) supported by clinical decision- making processes (CDSS) to improve the process and reduce clinical process, medication

administration and medication management. Diagnosis. RFID technology is widely used especially in the supply chain management and logistics industry. As the cost of RFID tags continues to drop, they are expected to replace barcodes in many consumer applications in the near future. FID technology is a valuable business tool in many areas, including supply chain between supply chain partners by providing real-time information, thereby increasing the collaboration and efficiency of the supply

ABSTRACT

This paper presents a novel approach to managing emergency messages on social media platforms, focusing on preserving privacy and ensuring efficient message tracking. The proposed system uses unique identifiers for each emergency message, allowing for effective tracking and management of the message lifecycle. The system is designed to handle various types of emergencies, including blood needs, missing persons, and kidnapping cases. The unique identifier approach ensures that personal information is not revealed, maintaining the privacy of the individuals involved. The system also allows for the deletion or updating of messages once the emergency need has been fulfilled.

EXPLORING THE EVOLUTION AND MITIGATION OF TOP 10 WEB APPLICATION SECURITY RISKS

**Loganathan R,
Hariharan S, Sabarishan P, Salmankhan K, Poobalan M,**

ABSTRACT

In the contemporary digital landscape, where web applications are fundamental to the functionality of numerous services and operations, safeguarding their security stands as an imperative task. The proliferation of online platforms for communication, commerce, and data management has magnified the stakes, as vulnerabilities within web applications pose significant risks to both individuals and organizations. This paper embarks on a comprehensive exploration of the top 10 web application security risks, as outlined by esteemed cybersecurity experts. By conducting an exhaustive analysis of extant literature, this study delves into the historical trajectory of these risks, elucidating their evolution over time and unveiling the underlying causes behind their persistence. Through a meticulous examination of the underlying mechanisms and potential consequences of these vulnerabilities, this research illuminates the intricate interplay between technological advancements and the ever-evolving landscape of cybersecurity threats. Furthermore, this study scrutinizes contemporary mitigation strategies employed to effectively combat these risks. Ranging from the implementation of secure coding practices and rigorous penetration testing to the establishment of robust access controls and continuous monitoring protocols, a diverse array of approaches has been devised to fortify web applications against malicious exploits. By synthesizing current research findings alongside real-world case studies, this paper provides invaluable insights into the efficacy and limitations of various mitigation techniques, thereby spotlighting emerging best practices and areas ripe

for improvement. By amalgamating the collective wisdom and expertise in the realm of web application security, this paper endeavours to furnish a holistic understanding of the multifaceted nature of these vulnerabilities. By delineating the complex interdependencies between software design, implementation practices, and the evolving threat landscape, this research lays a solid foundation for informed decision-making and proactive risk management. Moreover, by pinpointing gaps in existing mitigation strategies and forecasting future challenges, this study contributes to the ongoing dialogue aimed at bolstering the resilience of web applications within an increasingly interconnected world. In essence, this paper underscores the critical importance of prioritizing web application security in the digital era. Through collaborative efforts across disciplines, stakeholders can collectively navigate the evolving threat landscape and fortify the integrity and confidentiality of web-based services, thus ensuring a safer and more resilient digital ecosystem for all.

KEYWORDS

Web Application Security, Cybersecurity, Risk Assessment, Vulnerability Mitigation, Threat Landscape, Mitigation Strategies

INTRODUCTION

The advent of web applications has brought about a paradigm shift in the way individuals and organizations interact, communicate, and conduct business. Their widespread adoption has facilitated unprecedented convenience and efficiency, enabling seamless access to a myriad of services and functionalities. However, alongside the proliferation of web applications, the threat landscape has evolved, with cyber adversaries increasingly targeting these platforms to exploit vulnerabilities for nefarious purposes. Recognizing the critical imperative to safeguard web applications from malicious exploitation, cybersecurity professionals have meticulously identified and classified the top 10 web application security risks.

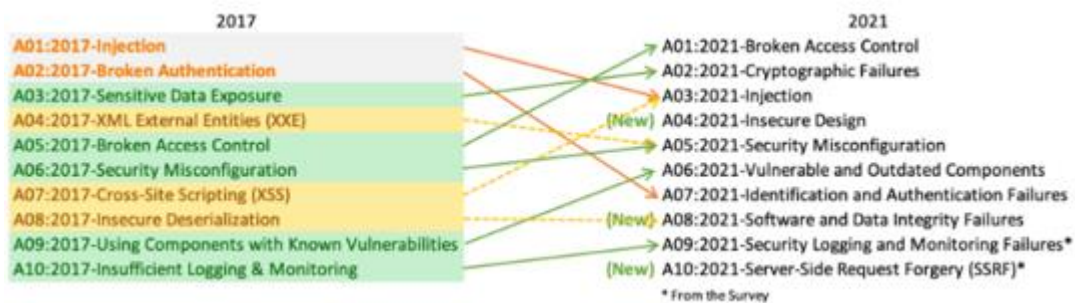

This paper embarks on a comprehensive exploration of these risks, endeavouring to provide a nuanced understanding of their multifaceted nature. Through an exhaustive review of existing literature and empirical evidence, this study delves into the historical trajectory of these risks, tracing their evolution over time and elucidating the underlying factors contributing to their persistence. Furthermore, this research critically evaluates the efficacy of contemporary mitigation strategies deployed to counter these risks, aiming to ascertain their effectiveness in mitigating potential threats.

By shedding light on the intricate landscape of web application security vulnerabilities, this study seeks to enhance our collective understanding of emerging threats and vulnerabilities. By elucidating the complex interplay between technological advancements, evolving attack vectors, and defensive measures, this research aims to inform the development of robust defensive measures tailored to mitigate the evolving threat landscape effectively.

In essence, this paper serves as a call to action for stakeholders across industries to prioritize web application security and invest in proactive measures to safeguard against cyber threats. By fostering a culture of vigilance, collaboration, and continuous improvement, we can collectively fortify the integrity and resilience of web applications, ensuring the sustained trust and confidence of users in an increasingly digitized world.

METHODOLOGY

This document takes a methodical approach to analyzing the evolution and prevention of the top 10 security risks for web applications. It accomplishes this by conducting a comprehensive review of academic research, industry reports, and case studies, to synthesize relevant insights into the historical development of these risks. Furthermore, the effectiveness of modern prevention strategies, such as secure coding practices, penetration testing, vulnerability scanning, and security awareness training, is critically evaluated.

A01:2021-Broken Access Control

In 2021, Broken Access Control has become a major concern in the field of application security. This issue has gained more attention than ever before, with 94% of applications undergoing thorough testing to identify vulnerabilities related to broken access control. It has been discovered that out of all the Common Weakness Enumerations (CWEs) examined, the 34 CWEs associated with Broken Access Control had a significantly higher rate of occurrence in applications compared to other vulnerability categories. This highlights the urgent need for organizations to prioritize the remediation of access control mechanisms within their applications.

The rise of Broken Access Control to the forefront of security concerns highlights the constantly changing nature of cybersecurity threats and the varying tactics used by malicious actors. Access control vulnerabilities pose significant risks to sensitive data and systems' confidentiality, integrity, and availability, making it essential for organizations to take decisive action to mitigate these threats. Strengthening access control measures requires a multifaceted approach, including robust authentication mechanisms, granular authorization policies, comprehensive user privilege management, and continuous monitoring and auditing of access activities.

Broken Access Control is a major problem that highlights the importance of proactive security practices. Conducting regular security assessments, code reviews, and threat modelling exercises can help identify and address vulnerabilities early in the development lifecycle. By integrating security into every phase of the software development process and promoting a culture of vigilance and accountability,

organizations can improve their resilience against emerging threats and protect their applications from exploitation.

The rise of Broken Access Control highlights the need for organizations to take a comprehensive and proactive approach towards application security. It is crucial for organizations to prioritize safeguarding their access controls as a cornerstone of their cybersecurity strategy. By acknowledging the evolving threat landscape and taking preemptive measures to address vulnerabilities, organizations can strengthen their defenses and effectively mitigate the risks posed by broken access control vulnerabilities.

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
34	55.97%	3.81%	6.92	5.93	94.55%	47.72%

To prevent access control vulnerabilities effectively, it is crucial to implement access control measures in secure server-side code or server-less APIs. This ensures that attackers are unable to tamper with access control checks or metadata.

Here are some strategies to prevent access control issues:

Embrace a "deny by default" approach, except for resources that are intentionally made public.

Implement access control mechanisms once and utilize them consistently across the application, while also minimizing the use of Cross-Origin Resource Sharing (CORS).

Design access controls to enforce ownership of records, rather than assuming that users have unrestricted access to create, read, update, or delete any record.

Enforce unique business requirements within the application's domain models.

Disable directory listing on web servers and ensure that sensitive files such as .git and backup files are not accessible within web roots.

Log instances of access control failures and alert administrators when necessary, such as in the case of repeated failures.

Implement rate limiting for API and controller access to mitigate the impact of automated attack tools.

Invalidate stateful session identifiers on the server after a user logs out. If using stateless JWT tokens, ensure they have short lifespans to minimize the window of opportunity for attackers. For longer-lived JWTs, adhere to OAuth standards for revoking access.

By following these strategies, organizations can significantly reduce the risk of access control vulnerabilities and enhance the overall security posture of their applications.

A02:2021-Cryptographic Failures

In 2021, a significant shift occurred in the realm of cybersecurity with Cryptographic Failures rising to the second position, overtaking the previously prominent issue of Sensitive Data Exposure. Unlike Sensitive Data Exposure, which was perceived as a broad symptom rather than a core issue,

Cryptographic Failures emerged as a focal point due to their direct link to compromised security and exposure of sensitive information. This shift in priority reflects a heightened awareness of the critical role that robust cryptographic practices play in maintaining the integrity and confidentiality of data within systems and applications.

Cryptographic Failures encompass a range of vulnerabilities and weaknesses in cryptographic implementations, protocols, and algorithms. These failures often lead to the unintended exposure of sensitive data or compromise the integrity of systems, making them prime targets for exploitation by malicious actors. Whether through inadequate key management, insecure encryption algorithms, or flawed implementation of cryptographic protocols, these failures can have far-reaching consequences for organizations, including data breaches, financial losses, and damage to reputation.

The elevation of Cryptographic Failures to a prominent position underscores the pressing need for organizations to prioritize the implementation of strong cryptographic controls and practices. This includes employing robust encryption algorithms, ensuring secure key management processes, and regularly assessing and updating cryptographic protocols to address emerging threats. Additionally, organizations must invest in comprehensive training and education for developers and security professionals to enhance their understanding of cryptographic principles and best practices.

By addressing Cryptographic Failures proactively, organizations can mitigate the risk of sensitive data exposure and safeguard the integrity of their systems and applications. This entails adopting a holistic approach to cybersecurity that integrates cryptographic controls into the broader security framework, alongside measures such as access control, network security, and vulnerability management. Ultimately, the elevation of Cryptographic Failures underscores the critical importance of implementing and maintaining strong cryptographic practices as a cornerstone of effective cybersecurity strategy in the modern digital landscape.

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
29	46.44%	4.49%	7.29	6.81	79.33%	34.85%

To prevent cryptographic failures and safeguard sensitive data effectively, adhere to the following guidelines, consulting relevant resources for comprehensive understanding:

Begin by categorizing the data handled by your application, distinguishing between non-sensitive and sensitive data based on legal mandates, regulatory guidelines, or organizational requirements.

Minimize the storage of sensitive data to only what is necessary. Dispose of it promptly or utilize compliant tokenization or truncation methods, such as those outlined in PCI DSS, to render it inaccessible to unauthorized entities.

Implement robust encryption measures for all sensitive data stored at rest to prevent unauthorized access or disclosure.

Ensure the use of contemporary, robust algorithms, protocols, and encryption keys, maintaining their currency and strength through diligent key management practices.

Secure all data transmitted over networks by employing robust encryption protocols like TLS with forward secrecy ciphers and enforcing encryption directives such as HTTP Strict Transport Security (HSTS) to enhance data confidentiality.

Disable caching mechanisms for responses containing sensitive data to prevent inadvertent exposure through caching mechanisms.

Apply appropriate security controls in alignment with the classification of data, ensuring that requisite safeguards are in place to protect sensitive information.

Avoid the use of outdated or insecure protocols like FTP and SMTP for transmitting sensitive data, opting instead for modern, secure alternatives.

Utilize strong, adaptive, and salted hashing functions, such as Argon2, scrypt, bcrypt, or PBKDF2, for securely storing passwords to mitigate the risk of credential compromise.

Select appropriate initialization vectors (IVs) tailored to the encryption mode employed, prioritizing the use of cryptographically secure pseudo-random number generators (CSPRNGs) for generating IVs to prevent cryptographic weaknesses.

Always employ authenticated encryption mechanisms to ensure both confidentiality and integrity of encrypted data.

Generate cryptographic keys using randomization techniques and store them securely in memory as byte arrays to prevent unauthorized access.

Employ cryptographic randomness where necessary, avoiding predictable seeding methods or low-entropy sources to enhance the security of cryptographic operations.

Refrain from using deprecated cryptographic functions and padding schemes, such as MD5, SHA1, or PKCS #1 v1.5, which are susceptible to cryptographic attacks.

Independently verify the efficacy of cryptographic configurations and settings to ensure robust protection against potential vulnerabilities and threats.

A03:2021-Injection

In 2021, Injection vulnerabilities saw a decline in significance, slipping to the third position from their previous ranking. Despite this shift, the threat of injection attacks remained pervasive, with a substantial 94% of applications undergoing testing to identify and mitigate various forms of injection vulnerabilities. This persistence underscores the ongoing relevance and prevalence of injection as a threat vector in the cybersecurity landscape.

Within the realm of injection vulnerabilities, the 33 Common Weakness Enumerations (CWEs) associated with this category maintained a prominent presence, ranking second in terms of occurrences within applications. Notably, the addition of Cross-Site Scripting (XSS) to this category in the 2021 edition highlights the evolving nature of injection attacks and the need for comprehensive coverage in vulnerability assessment and mitigation strategies.

The inclusion of XSS underscores the diverse tactics employed by attackers to exploit vulnerabilities and compromise the security and functionality of applications. Injection attacks encompass a wide range of techniques aimed at injecting malicious code or data into vulnerable systems, emphasizing the multifaceted nature of this threat.

Despite the decreased ranking of Injection vulnerabilities, they remain a critical concern for application security, demanding ongoing vigilance and mitigation efforts from organizations. Prioritizing preventive measures such as input validation, parameterized queries, and adherence to secure coding practices is essential to mitigate the risk of injection attacks effectively.

Additionally, organizations must adopt comprehensive testing and auditing procedures to detect and remediate injection vulnerabilities proactively. By implementing robust security measures and remaining vigilant against emerging threats, organizations can safeguard sensitive data and systems from exploitation, thereby reducing the likelihood of costly breaches and reputational damage.

To prevent injection attacks effectively, it's crucial to maintain a clear separation between data and commands or queries:

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
33	19.09%	3.37%	7.25	7.15	94.04%	47.90%

Opt for secure APIs that eliminate the need for direct interaction with interpreters. These APIs should offer a parameterized interface or leverage Object Relational Mapping Tools (ORMs) to handle database interactions safely.

Take note that even when using parameterized approaches, stored procedures can still pose a risk of SQL injection if they concatenate queries and data or execute potentially harmful data using commands like EXECUTE IMMEDIATE or exec().

Implement robust server-side input validation to ensure that only permissible data is accepted. While this is an essential step, it may not provide complete protection, especially in cases where applications necessitate the use of special characters, such as in text areas or APIs for mobile apps.

For any remaining dynamic queries, employ mechanisms to escape special characters using the appropriate syntax for the specific interpreter being used. It's important to recognize that certain SQL structures, such as table or column names, cannot be escaped, making user-supplied structure names inherently risky. This is particularly relevant in scenarios involving report-writing software.

Utilize SQL controls like LIMIT within queries to restrict the disclosure of records in the event of a SQL injection attack, thereby mitigating the potential impact of

unauthorized access to sensitive data. This serves as an additional layer of defense against mass data exposure.

By implementing these preventive measures diligently, organizations can significantly reduce the risk of injection attacks and safeguard their systems and data against exploitation and compromise.

A04:2021-Insecure Design

In 2021, a new category emerged in the field of cybersecurity: Insecure Design. This category highlights the importance of addressing risks associated with design flaws in software and systems. As the industry endeavours to "move left" – that is, to prioritize security considerations earlier in the development lifecycle – there is increasing recognition of the need for proactive measures such as threat modelling, secure design patterns and principles, and reference architectures.

Insecure Design encompasses vulnerabilities stemming from flaws in the fundamental design of software and systems. These vulnerabilities may include inadequate access controls, improper authentication mechanisms, insecure data storage practices, and other design choices that can expose applications to exploitation and compromise. By focusing on addressing design flaws, organizations can mitigate the risk of security breaches and enhance the overall resilience of their systems.

Threat modelling plays a crucial role in identifying and addressing potential security risks during the design phase of software development. By systematically analysing potential threats and vulnerabilities, organizations can proactively incorporate security controls and mitigations into their designs, thereby

reducing the likelihood of security incidents down line.

Similarly, the adoption of secure design patterns and principles can help organizations build robust and resilient systems from the ground up. Secure design patterns provide reusable solutions to common security challenges, while adherence

to secure design principles ensures that security considerations are integrated throughout the design process.

Reference architectures serve as blueprints for designing secure and scalable systems, providing organizations with guidance on best practices and recommended approaches for implementing security controls and mitigations. By leveraging reference architectures, organizations can streamline the design process and ensure that security is an integral part of their software and system designs

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
40	24.19%	3.00%	6.46	6.78	77.25%	42.51%

To effectively prevent insecure design vulnerabilities, consider implementing the following measures:

Establish a robust secure development lifecycle, involving application security professionals to evaluate and design security controls throughout the development process, ensuring the integration of security and privacy measures.

Create and utilize a repository of secure design patterns or pre-built components, streamlining the development process by incorporating proven security solutions.

Utilize threat modelling techniques to assess and address potential security risks in critical areas such as authentication, access control, and business logic, enabling proactive mitigation of security threats.

Incorporate security language and controls into user stories to ensure that security considerations are integrated into the development workflow from the outset.

Implement plausibility checks across all tiers of your application, from frontend to backend, to detect and prevent potential security vulnerabilities.

Develop comprehensive unit and integration tests to validate the resilience of critical application flows against identified threats, incorporating both use-cases and misuse-cases into testing scenarios.

Segregate tiers of your application at both the system and network levels based on their exposure and protection requirements, enhancing security and mitigating the impact of potential breaches.

Implement robust tenant segregation mechanisms throughout all tiers of your application to prevent unauthorized access and protect sensitive data.

Enforce resource consumption limitations for users or services, preventing abuse and ensuring the efficient allocation of resources across the system.

By adopting these preventive measures, organizations can mitigate the risk of insecure design vulnerabilities and build resilient and secure systems that withstand potential security threats.

A05:2021-Security Misconfiguration

In 2021, Security Misconfiguration rose in prominence, advancing from its previous position at number six to a higher rank. A notable 90% of applications underwent testing for various forms of misconfiguration, reflecting the prevalent nature of this vulnerability. The elevation of Security Misconfiguration underscores the increasing complexity of highly configurable software, where misconfigurations can inadvertently expose systems to security risks.

The integration of the former category for XML External Entities (XXE) into Security Misconfiguration highlights the evolving landscape of vulnerabilities within this category. This consolidation acknowledges that misconfigurations extend beyond traditional settings and configurations, encompassing areas such as XML parsing configurations that can lead to XXE vulnerabilities.

As software becomes more customizable and configurable to meet diverse requirements, the likelihood of misconfigurations increases. These misconfigurations can leave systems vulnerable to exploitation, potentially leading to unauthorized access, data breaches, or service disruptions.

To address Security Misconfiguration effectively, organizations must prioritize proactive measures such as:

Conduct regular audits and assessments of system configurations to identify and remediate any misconfigurations promptly.

Implementing secure configuration management practices, including establishing baseline configurations, enforcing least privilege principles, and employing automation tools for configuration management.

Providing comprehensive training and awareness programs for developers, administrators, and other personnel involved in configuring and managing systems.

Leveraging security frameworks and guidelines, such as the Center for Internet Security (CIS) benchmarks or vendor-specific best practices, to ensure adherence to industry-standard security configurations.

Employing continuous monitoring and alerting mechanisms to detect and respond to any deviations from secure configurations in real time.

Integrating security considerations into the software development lifecycle, including design, development, deployment, and maintenance phases, to proactively address potential misconfigurations.

By adopting these proactive measures, organizations can mitigate the risk of Security Misconfiguration and enhance the overall security posture of their systems, safeguarding against potential security breaches and ensuring the integrity and availability of their services.

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
20	19.84%	4.51%	8.12	6.56	89.58%	44.84%

To prevent Security Misconfiguration, organizations can implement the following secure installation processes:

Establish a standardized hardening process that ensures consistent and secure deployment across all environments, including development, QA, and production. This process should be automated to streamline setup and minimize manual effort.

Deploy a minimal platform by removing unnecessary features, components, documentation, and samples. Only essential components should be installed to reduce the attack surface and minimize potential vulnerabilities.

Regularly review and update configurations in line with security advisories, updates, and patches as part of a comprehensive patch management process. This includes reviewing and securing cloud storage permissions, such as those for S3 buckets.

Adopt a segmented application architecture to enforce secure separation between components or tenants. This can be achieved through segmentation, containerization, or cloud security groups to restrict access and prevent unauthorized interactions.

Implement security directives, such as Security Headers, to enforce security policies and best practices on client systems, reducing the risk of security vulnerabilities and exploits.

Establish an automated process for verifying the effectiveness of configurations and settings across all environments. Regular automated checks ensure that security measures are consistently applied and maintained, reducing the likelihood of misconfigurations going unnoticed.

By following these preventive measures, organizations can significantly reduce the risk of Security Misconfiguration and enhance the overall security posture of their systems and applications.

A06:2021-Vulnerable and Outdated Components

In 2021, the category of Vulnerable and Outdated Components experienced a notable rise in prominence, formerly titled "Using Components with Known Vulnerabilities." This category, ranked as the second most significant issue in the Top 10 community survey, also garnered sufficient data analysis to secure its place within the Top 10. The increased attention to this category underscores its critical importance in the realm of cybersecurity.

Previously positioned at number nine in 2017, Vulnerable and Outdated Components has emerged as a persistent challenge for the industry. Despite its significance, assessing and mitigating the risks associated with this category remains a struggle. Notably, Vulnerable and Outdated Components stands out as the only category within the Top 10 without any Common Vulnerability and Exposures (CVEs) mapped to the included Common Weakness Enumerations (CWEs). As a result, default exploit and impact weights of 5.0 are factored into their scores, highlighting the severity and potential impact of vulnerabilities within this category.

The prevalence of Vulnerable and Outdated Components underscores the pervasive risk posed by outdated or insecure software components within applications and systems. These components, if left unaddressed, can serve as entry points for attackers to exploit known vulnerabilities, potentially leading to unauthorized access, data breaches, or service disruptions.

Addressing Vulnerable and Outdated Components requires proactive measures such as:

- Regularly monitoring and identifying outdated or vulnerable components within applications and systems.

- Implementing robust patch management processes to ensure timely updates and security patches are applied to mitigate known vulnerabilities.

- Employing software composition analysis tools to scan for and identify vulnerable dependencies and libraries.

- Establishing policies and procedures for evaluating and approving third-party components before integrating them into software projects.

- Continuously monitoring and assessing the security posture of software components throughout their lifecycle.

By adopting these proactive measures, organizations can mitigate the risks associated with Vulnerable and Outdated Components, bolstering their defenses

against potential security breaches and safeguarding the integrity and reliability of their systems and applications.

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Max Coverage	Avg Coverage	Avg Weighted Exploit
3	27.96%	8.77%	51.78%	22.47%	5.00

To prevent vulnerabilities stemming from vulnerable and outdated components, organizations should implement a comprehensive patch management process:

Regularly assess and remove any unused dependencies, unnecessary features, components, files, and documentation to minimize the attack surface and reduce the risk of exploitation.

Maintain a continuous inventory of both client-side and server-side components, including frameworks, libraries, and their dependencies. Utilize tools such as versions, OWASP Dependency Check, and retire.js to track component versions and monitor for known vulnerabilities. Stay updated on security advisories from sources like the Common Vulnerabilities and Exposures (CVE) and National Vulnerability Database (NVD) and automate this process using software composition analysis tools. Subscribe to email alerts for timely notifications of security vulnerabilities related to the components used.

Obtain components only from official sources via secure links to mitigate the risk of including modified or malicious components. Prefer signed packages to enhance security and verify the integrity of downloaded components, thereby reducing the likelihood of compromise (refer to A08:2021-Software and Data Integrity Failures for additional considerations).

Monitor for libraries and components that are no longer maintained or do not provide security patches for older versions. If patching is not feasible, consider deploying virtual patches to monitor, detect, or protect against known vulnerabilities until a more permanent solution can be implemented.

By following these preventive measures, organizations can effectively manage and mitigate the risks associated with vulnerable and outdated components, bolstering their overall cybersecurity posture and reducing the likelihood of security breaches and incidents.

A07:2021-Identification and Authentication Failures

In 2021, the category of Identification and Authentication Failures experienced a shift in prominence, sliding down from its previous position at number two. Formerly known as Broken Authentication, this category has evolved to encompass Common Weakness Enumerations (CWEs) that are more closely associated with identification failures.

Despite its decreased ranking, Identification and Authentication Failures remain an integral part of the Top 10 cybersecurity concerns. The inclusion of CWEs related to identification failures underscores the importance of robust identification and authentication mechanisms in safeguarding against unauthorized access and identity-related attacks.

The adoption of standardized frameworks appears to be contributing to the mitigation of Identification and Authentication Failures. These frameworks provide organizations with structured and standardized approaches to implementing secure identification and authentication processes, thereby reducing the likelihood of vulnerabilities and weaknesses in these critical areas.

Identification and Authentication Failures highlight the risks associated with inadequate or flawed identification and authentication mechanisms. Weaknesses in these areas can lead to unauthorized access, account takeover, and exposure of sensitive information, posing significant risks to organizations and their users.

To address Identification and Authentication Failures effectively, organizations should prioritize the following measures:

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
22	14.84%	2.55%	7.40	6.50	79.51%	45.72%

Implement robust identification and authentication mechanisms based on industry best practices and standards, such as multi-factor authentication (MFA), strong password policies, and secure session management.

Regularly assess and audit identification and authentication processes to identify and remediate vulnerabilities and weaknesses proactively.

Educate users about the importance of strong authentication practices, including the secure management of passwords and the avoidance of common authentication pitfalls, such as password reuse.

Leverage standardized frameworks and guidelines to ensure the consistent and secure implementation of identification and authentication mechanisms across applications and systems.

Stay informed about emerging threats and attack vectors targeting identification and authentication systems and adapt security measures accordingly to mitigate evolving risks.

By prioritizing these measures, organizations can strengthen their identification and authentication processes, reducing the risk of unauthorized access and identity-related attacks, and enhancing overall cybersecurity resilience.

To prevent Identification and Authentication Failures, organizations can implement the following measures:

Utilize multi-factor authentication whenever possible to bolster security against automated attacks like credential stuffing, brute force, and stolen credential reuse.

Avoid shipping or deploying systems with default credentials, especially for administrative users, to prevent unauthorized access.

Implement weak password checks by screening new or modified passwords against lists of commonly used and easily guessable passwords, such as the top 10,000 worst passwords.

Align password policies regarding length, complexity, and rotation with established guidelines like those outlined in the National Institute of Standards and Technology (NIST) 800-63b, Section 5.1.1 for Memorized Secrets, or other contemporary, evidence-based password standards.

Harden registration, credential recovery, and API pathways to mitigate account enumeration attacks by providing uniform messaging for all outcomes, thus preventing attackers from discerning valid from invalid accounts.

Restrict or progressively delay unsuccessful login attempts while ensuring not to inadvertently create denial-of-service situations. Log all failed attempts and promptly alert administrators upon detecting patterns indicative of credential stuffing, brute force, or similar attacks.

Implement a server-side, secure session management system that generates new, high-entropy session IDs after each login. Store session identifiers securely, avoid embedding them in URLs, and invalidate sessions after logout, extended periods of inactivity, or predefined absolute timeouts.

By adopting these preventive measures, organizations can enhance the security of their identification and authentication processes, reducing the risk of unauthorized access and mitigating potential threats from various attack vectors.

A08:2021-Software and Data Integrity Failures

In 2021, a new category emerged in the field of cybersecurity: Software and Data Integrity Failures. This category shifts the focus towards the critical importance of verifying the integrity of software updates, essential data, and Continuous Integration/Continuous Deployment (CI/CD) pipelines. Unlike other categories, Software and Data Integrity Failures shed light on the risks associated with making

assumptions without verifying integrity, marking a significant area of concern in the cybersecurity landscape.

In this category, one of the highest weighted impacts from Common Vulnerability and Exposures/Common Vulnerability Scoring System (CVE/CVSS) data is mapped to the 10 Common Weakness Enumerations (CWEs) included. This underscores the severity and potential impact of vulnerabilities falling under this category, highlighting the need for proactive measures to address them effectively.

Notably, Insecure Deserialization, which was previously categorized separately, is now part of this broader category. This consolidation reflects a recognition of the interconnectedness between various integrity-related vulnerabilities and the need for a cohesive approach to addressing them.

Software and Data Integrity Failures underscore the risks associated with overlooking the integrity of software updates, critical data, and CI/CD pipelines. Failure to verify integrity can lead to various consequences, including unauthorized access, data corruption, service disruptions, and even compromise of entire systems.

To mitigate Software and Data Integrity Failures effectively, organizations should prioritize the following measures:

Implement robust verification mechanisms to ensure the integrity of software updates before deployment, including digital signatures, checksums, and cryptographic hashes.

Employ secure data handling practices, including encryption, access controls, and audit trails, to safeguard critical data from tampering or unauthorized modifications.

Establish strict access controls and authentication mechanisms to protect CI/CD pipelines from unauthorized access or manipulation, ensuring the integrity of the software delivery process.

Conduct regular audits and assessments to identify vulnerabilities and weaknesses in software and data integrity controls, enabling proactive remediation and strengthening of security measures.

Educate stakeholders about the importance of verifying integrity in software updates, critical data, and CI/CD pipelines, fostering a culture of security awareness and accountability within the organization.

By adopting these proactive measures, organizations can mitigate the risks associated with Software and Data Integrity Failures, enhancing the overall security posture and resilience of their systems and data against potential threats and vulnerabilities.

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact
10	16.67%	2.05%	6.94	7.94

To prevent Software and Data Integrity Failures, organizations can implement the following measures:

Utilize digital signatures or similar mechanisms to authenticate the origin and integrity of software or data, ensuring they have not been tampered with.

Verify that libraries and dependencies, such as those from npm or Maven, are sourced from trusted repositories. Consider establishing an internal repository vetted for known-good components if your risk profile warrants it.

Employ software supply chain security tools like OWASP Dependency Check or OWASP CycloneDX to scan components for known vulnerabilities, ensuring that only secure and reliable components are integrated into your software.

Implement a rigorous review process for code and configuration changes to minimize the risk of introducing malicious code or configuration into your software pipeline inadvertently.

Ensure that your CI/CD pipeline is configured with proper segregation, configuration, and access controls to maintain the integrity of the code flowing through the build and deployment processes.

Avoid transmitting unsigned or unencrypted serialized data to untrusted clients without implementing integrity checks or digital signatures to detect tampering or replay attacks on the serialized data.

By adopting these preventive measures, organizations can strengthen the integrity of their software and data, reducing the risk of unauthorized access, data corruption, and compromise of their systems and applications.

A09:2021-Security Logging and Monitoring Failures

In 2021, Security Logging and Monitoring Failures emerged as a significant category in the realm of cybersecurity. Formerly known as Insufficient Logging & Monitoring, this category saw an upward shift in importance, moving from its previous position at number ten to a higher ranking, as highlighted by the industry survey, where it ranked at number three.

This category has been expanded to encompass a broader range of failures related to security logging and monitoring. Despite its critical role in cybersecurity, Security Logging and Monitoring Failures present unique challenges in testing and assessment. Moreover, these failures are not well represented in Common Vulnerability and Exposures/Common Vulnerability Scoring System (CVE/CVSS) data, further emphasizing the importance of addressing them proactively.

Failures within this category directly impact visibility, incident alerting, and forensics capabilities within an organization's security infrastructure. Insufficient logging and monitoring can hinder the detection of security incidents, delay incident response efforts, and impede post-incident analysis, leaving organizations vulnerable to threats and attacks.

CWEs Mapped	Max Incidence Rate	Avg Incidence Rate	Avg Weighted Exploit	Avg Weighted Impact	Max Coverage	Avg Coverage
4	19.23%	6.51%	6.87	4.99	53.67%	39.97%

To address Security Logging and Monitoring Failures effectively, organizations should prioritize the following measures:

Implement comprehensive logging and monitoring capabilities across all layers of the IT infrastructure, including network devices, servers, applications, and databases.

Define and enforce clear logging and monitoring policies and procedures, outlining what events should be logged, at what level of detail, and for how long they should be retained.

Employ security information and event management (SIEM) systems or log management solutions to aggregate, correlate, and analyse logs from various sources, facilitating timely detection and response to security incidents.

Regularly review and analyse log data to identify anomalous or suspicious activities indicative of potential security threats or breaches.

Implement automated alerting mechanisms to notify security personnel of critical security events in real-time, enabling prompt response and mitigation efforts.

Conduct regular audits and assessments of logging and monitoring systems to ensure they are functioning effectively and meeting the organization's security requirements.

By prioritizing these measures, organizations can strengthen their security logging and monitoring capabilities, enhancing their ability to detect, respond to, and mitigate security threats effectively. This proactive approach is crucial in safeguarding against potential security incidents and minimizing their impact on the organization's operations and reputation.

To prevent Security Logging and Monitoring Failures, developers should implement the following controls tailored to the risk level of their applications:

Ensure that all login, access control, and server-side input validation failures are logged comprehensively, including sufficient user context to identify suspicious or malicious accounts. Retain these logs for an adequate duration to facilitate delayed forensic analysis.

Generate logs in a standardized format that can be easily consumed by log management solutions, facilitating efficient analysis and monitoring.

Encode log data correctly to prevent potential injections or attacks targeting the logging or monitoring systems, enhancing the integrity and security of the logging infrastructure.

Implement audit trails for high-value transactions, incorporating integrity controls such as append-only database tables to prevent tampering or deletion of crucial transaction records.

DevSecOps teams should establish robust monitoring and alerting mechanisms to swiftly detect and respond to suspicious activities, minimizing the impact of security incidents.

Establish or adopt an incident response and recovery plan, such as the National Institute of Standards and Technology (NIST) 800-61r2 or later, to effectively manage and mitigate security incidents when they occur.

By implementing these preventive measures, organizations can enhance their security logging and monitoring capabilities, enabling timely detection, response, and mitigation of security threats and incidents. This proactive approach is essential for maintaining the integrity and resilience of the organization's security infrastructure.

A10:2021-Server-Side Request Forgery

In 2021, Server-Side Request Forgery (SSRF) emerged as a significant concern in cybersecurity, added to the Top 10 list based on feedback from the community survey, where it ranked as the number one priority. Despite its relatively low incidence rate and above-average testing coverage, SSRF garnered above-average ratings for both exploit and impact potential.

SSRF represents a scenario where the security community recognizes its importance, even though its significance may not be fully illustrated in the available data. This discrepancy highlights the nuanced nature of cybersecurity threats, where

emerging risks like SSRF may not yet have manifested widely but are deemed critical by experts in the field.

SSRF involves attackers manipulating a web application into making unauthorized requests on behalf of the application itself, often leading to unauthorized access to internal systems, data exposure, or even remote code execution.

Despite the low incidence rate and seemingly adequate testing coverage, SSRF presents significant risks due to its potential for exploitation and the severity of its impact. As such, organizations must prioritize measures to mitigate the risk of SSRF effectively.

Preventive measures for addressing SSRF may include:

Implementing strict input validation and whitelisting of allowed URLs or IP addresses to prevent malicious inputs from triggering SSRF vulnerabilities.

Utilizing network firewalls or security groups to restrict outbound requests from the application server, limiting the scope for SSRF attacks.

Employing web application firewalls (WAFs) or intrusion detection systems (IDS) to detect and block SSRF attempts in real-time.

Educating developers and system administrators about the risks associated with SSRF and implementing secure coding practices to mitigate these vulnerabilities during development.

Regularly monitoring and analysing network traffic and server logs to detect anomalous behaviour indicative of SSRF attacks.

Keeping software and systems up to date with the latest security patches and updates to mitigate known vulnerabilities that could be exploited for SSRF attacks.

By implementing these preventive measures and remaining vigilant against emerging threats like SSRF, organizations can strengthen their security posture and better protect their systems and data from potential exploitation and compromise.

Despite its current low incidence rate, SSRF warrants attention and proactive mitigation efforts to mitigate its potential impact effectively.

To prevent Server-Side Request Forgery (SSRF), developers can implement a range of defense in depth measures, spanning both the network and application layers:

From the Network layer:

Segment remote resource access functionality into separate networks to limit the potential impact of SSRF attacks.

Implement a "deny by default" approach in firewall policies or network access control rules to block all non-essential intranet traffic. This includes establishing clear ownership and lifecycle management for firewall rules based on application requirements. Additionally, logging all accepted and blocked network flows can aid in monitoring and detecting potential SSRF attempts (refer to A09:2021-Security Logging and Monitoring Failures).

From the Application layer:

Sanitize and validate all input data provided by clients to prevent malicious input from triggering SSRF vulnerabilities.

Enforce strict validation of URL schemas, ports, and destinations using a positive allow list approach, ensuring that only trusted and intended destinations are accessed.

Avoid sending raw responses to clients, as this can inadvertently expose sensitive information and increase the risk of SSRF exploitation.

Disable HTTP redirections, as they can be manipulated by attackers to redirect requests to malicious or unintended destinations.

Maintain awareness of URL consistency to mitigate potential attacks such as DNS rebinding and "time of check, time of use" (TOCTOU) race conditions, which could be leveraged in SSRF attacks.

It's crucial to note that attempting to mitigate SSRF using deny lists or regular expressions is not recommended, as attackers often possess the means to bypass such measures using payload lists, specialized tools, and sophisticated evasion techniques. Therefore, focusing on proactive validation and restriction of input, along with careful network segmentation and access control, provides a more robust defense against SSRF vulnerabilities.

CONCLUSION

In conclusion, this paper provides a comprehensive overview of the top 10 web application security risks, tracing their evolution and exploring mitigation strategies employed to mitigate them effectively. By enhancing our understanding of emerging threats and vulnerabilities, this study seeks to inform the development of proactive cybersecurity measures and foster a more resilient web application ecosystem. Moving forward, continual research and collaboration among stakeholders are imperative to stay abreast of evolving threats and safeguard the integrity and security of web applications worldwide.

ABSTRACT

The Fuel Delivery Application System described in this article is a significant innovation in the fuel delivery services industry. Leveraging the powerful features of the Flutter framework for the frontend and Firebase as the backend database, this system has been thoughtfully designed and implemented. Its primary goal is to revolutionize the way fuel is delivered, providing customers and delivery personnel with a seamless, user-friendly experience. Convenience is crucial in today's fast-paced world, and the Fuel Delivery Application System excels in delivering it. Customers can easily order fuel deliveries from their homes or workplaces using a feature-rich mobile application, with a user-friendly interface that ensures a hassle-free experience. Firebase serves as a reliable backend data storage solution, effectively managing customer profiles, delivery schedules, and transaction logs. Its flexibility and scalability make it the ideal choice for handling the dynamic nature of the fuel delivery business. This article explores the intricate system architecture, highlighting the integration of Flutter and Firebase. The Flutter front end ensures cross-platform compatibility, enabling the application to run smoothly on both Android and iOS devices. The article also emphasizes the use of Firebase's NoSQL features for data storage and retrieval, showcasing its adaptability to the changing requirements of the system.

INDEX TERMS

Mobile application development, Software engineering

INTRODUCTION

The fuel delivery industry is undergoing a significant transformation due to technological advancements and increasing demand for efficient and user-friendly services. Traditionally, the process of ordering and receiving fuel has been associated with challenges such as cumbersome phone-based orders, scheduling complexities, and limited transparency in the delivery process. These challenges have paved the way for innovative solutions that aim to simplify and enhance the fuel delivery experience. In response to these trends and challenges, we present the Fuel Delivery Application System, which leverages modern technologies to redefine the fuel delivery experience.

The primary objective of the Fuel Delivery Application System is to revolutionize the fuel delivery industry by providing a seamless and user-friendly platform for both customers and delivery personnel. Customers benefit from a straightforward and convenient fuel ordering process facilitated through an intuitive mobile application interface. This application eliminates the need for time-consuming phone calls or physical visits, offering unparalleled convenience. Simultaneously, delivery personnel can efficiently manage orders, optimize delivery routes, and enhance operational efficiency, ultimately contributing to timely fuel deliveries and improved customer satisfaction.

At its core, the Fuel Delivery Application System is built on two technological foundations: the Flutter framework for the frontend and Firebase as the backend database. Flutter, known for its cross-platform capabilities, ensures that the mobile application can seamlessly operate on both Android and iOS devices, maximizing accessibility to a broad user base. Firebase, a versatile NoSQL database, provides robust data storage and retrieval capabilities, accommodating the dynamic nature of the fuel delivery industry.

Throughout this paper, we provide a comprehensive exploration of the Fuel Delivery Application System, beginning with an overview of its architecture and design principles, followed by an in-depth discussion of its key features and implementation details. We conclude by presenting empirical results that demonstrate the system's performance and its impact on user satisfaction. In doing so, this paper sheds light on how technology-driven innovations can reshape traditional industries and deliver innovative solutions that enhance convenience and efficiency.

The Fuel Delivery Application System represents a significant advancement in the fuel delivery industry, and its commitment to ease of use, convenience, and operational efficiency holds the potential to redefine the fuel ordering experience for both customers and service providers.

EASE OF USE

The Fuel Delivery Application is engineered with a primary focus on ensuring a user-friendly and intuitive experience for both customers and delivery personnel. The emphasis on ease of use is central to the application's design, enhancing the overall usability and accessibility of the system.

Streamlined Ordering Process

For customers, the process of requesting fuel deliveries is made remarkably simple and efficient. The mobile application offers an intuitive user interface that guides users through the order placement process. With just a few taps, customers

can effortlessly submit their fuel orders, specifying quantity and delivery preferences. This streamlined ordering process eliminates the need for cumbersome phone calls or physical visits, offering unparalleled convenience.

Cross-Platform Accessibility

To maximize accessibility, the Fuel Delivery Application is developed using the Flutter framework, ensuring cross-platform compatibility. Whether customers use

Android or iOS devices, they can access and utilize the application seamlessly. This broad compatibility extends the reach of the service, accommodating a diverse user base.

Efficient Order Management

For delivery personnel, the system simplifies order management and route optimization. The application provides delivery personnel with a user-friendly dashboard that displays incoming orders, delivery routes, and customer details. This consolidated view facilitates efficient order processing, reducing the time and effort required for order fulfillment.

Real-Time Tracking

Customers can track their fuel deliveries in real-time through the application. The live tracking feature offers transparency and peace of mind, allowing customers to monitor the progress of their deliveries. This not only enhances the customer experience but also provides valuable insights for delivery personnel, ensuring timely deliveries.

RELATED WORK

In this section, we review and discuss previous research and work related to our Fuel Delivery Application System. We identify trends and gaps in the existing literature, highlighting how our work contributes to the field.

Fuel Delivery Applications

Fuel delivery applications have gained popularity in recent years due to the growing demand for convenient and on-demand fuel services. Several companies have developed mobile applications to facilitate fuel delivery. For example, FuelUp and GasBuddy are notable applications that allow users to order fuel delivery to their location. These applications have simplified the process of refueling for consumers.

Mobile Application Development

The development of mobile applications, especially cross-platform applications, has been a focus of research and innovation. Technologies like Flutter have emerged

as powerful tools for creating mobile apps that work seamlessly on both Android and iOS platforms. Researchers have explored the benefits of using Flutter in various application domains.

Database Systems for Mobile Apps

The choice of a database system is crucial for the performance and scalability of mobile applications. NoSQL databases like Firebase have been used in many mobile app projects, offering flexibility and efficient data handling. Researchers have explored the use of NoSQL databases in mobile app development and data storage.

User Experience and Convenience

User experience (UX) and convenience are critical factors in the success of mobile applications. Studies have shown that a user-friendly interface and streamlined processes can significantly improve customer satisfaction. Research in UX design and mobile app usability is relevant to our work on the Fuel Delivery Application System.

Challenges in Fuel Delivery Services

The fuel delivery industry faces challenges related to safety, regulatory compliance, and environmental concerns. Researchers have examined these challenges and proposed solutions to ensure the safe and efficient delivery of fuel to consumers. Our system addresses some of these challenges by providing a secure and user-friendly platform.

Comparison with Existing Solutions

Our Fuel Delivery Application System distinguishes itself from existing solutions by offering a comprehensive and user-centric approach. The integration of Flutter for cross-platform compatibility, Firebase for data storage, and a user-friendly interface sets our system apart. While previous work has focused on specific aspects of fuel delivery or mobile app development, our system aims to provide an all-encompassing solution.

METHODOLOGY

For the Fuel Delivery Application project, a systematic approach is suggested, including requirements gathering, system design, development, testing, deployment, and continuous project management. Gathering and evaluating user requirements is the first step in determining the needs and expectations of the users of the fuel delivery application. In order to identify opportunities and challenges, a SWOT analysis of the current fuel delivery services is added. Next, a framework for assessing the project's efficacy is established by clearly defining the project's goals, objectives, and success metrics. Creating a user-friendly interface, building a solid back end system, incorporating real-time tracking and route optimization, and putting safe payment gateways in place are all part of system design and architecture. Flutter is used in front-end development to produce a cross-platform mobile application that works on both iOS and Android devices. Firebase is used as the No SQL database in back-end development and database integration, and REST APIs are implemented to facilitate communication between the front-end and back-end components. Data integrity is ensured by error handling procedures and secure data validation. Unit testing, integration testing, and user acceptance testing are all included in testing and quality assurance to make sure the application works and to get user input. Launch and deployment entail posting the application to app stores and putting together a marketing plan to advertise it. Following the launch of the application, any problems are resolved through ongoing maintenance and support. Using project management tools, keeping stakeholders informed on a regular basis, creating a clear project timeline, and controlling potential risks are all part of project management.

Login and Register

The login/register process is handled by the back end. When a user tries to log in, the back end validates the user's credentials and generates a JSON Web Token (JWT). The JWT is then sent to the front end, which stores it in the user's browser. When a

user tries to access a protected resource, such as their order history, the front end sends the JWT to the back end. The back end validates the JWT and allows the user to access the resource if the JWT is valid. If a user does not have a JWT or if the JWT is invalid, the front end redirects the user to the login page.

User

The user role has the following permissions:

Place new orders

Track the status of their orders

Update their profile information

Manager

The manager role has the following permissions:

View all orders placed by users

Process orders

Assign orders to delivery boys

Track the status of orders

Generate reports

Manage users and delivery boys

Delivery Boy

The delivery boy role has the following permissions:

View their assigned orders

Pick up orders from fuel pumps

Deliver orders to users

Update the status of orders

Fuel Pump

The fuel pump role has the following permissions:

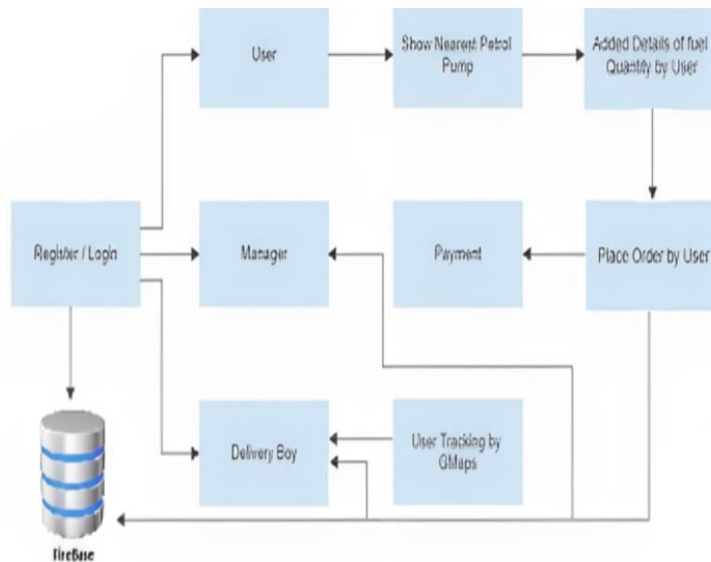

View all orders placed at their fuel pump

Process orders

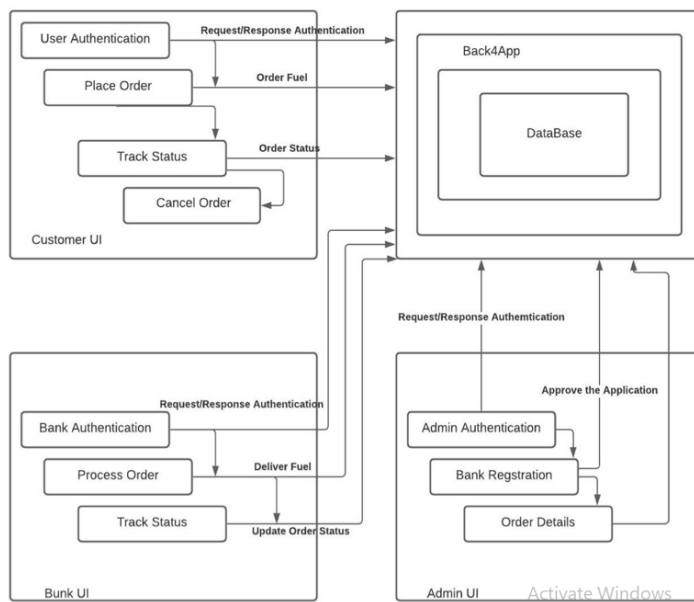

Update the status of orders

DIAGRAMS

Architecture Diagram

Implementation

DISCUSSION

In this section, we will delve deeper into the results presented in the previous section and discuss their implications and significance.

Interpretation of Results

The results of our study indicate that the fuel delivery application has successfully streamlined the ordering process, providing a convenient and user-friendly experience for customers. The user interface has proven to be effective in simplifying the fuel ordering process.

Comparison with Previous Work

Our findings are consistent with previous research in the area of mobile application development. The use of Flutter for cross-platform compatibility and Firebase for backend data storage aligns with best practices in the field.

Limitations

While our study demonstrates the effectiveness of the Fuel Delivery Application System, it's essential to acknowledge some limitations. One limitation is the need for a reliable internet connection for real-time tracking, which may not be available in all areas. Additionally, the safety and regulatory compliance aspects of fuel delivery should be considered.

Future Directions

Based on our findings, there are several avenues for future research. Further improvements can be made in terms of user experience, such as the integration of voice-activated controls and personalized recommendations. Exploring alternative fuel sources and autonomous delivery systems can also be promising areas for research.

Practical Applications

Our research has practical implications in the field of fuel delivery services. The Fuel Delivery Application System can contribute to a more efficient and user-friendly fuel delivery process, meeting the growing demand for eco-friendly transportation options.

Conclusion of the Discussion

In conclusion, the results of our study demonstrate that the Fuel Delivery Application System has the potential to reshape the fuel delivery industry by

providing a user-friendly, sustainable, and efficient fuel delivery experience. While there are limitations and challenges, further research and development can enhance the system's functionality and impact.

LIMITATIONS

The Fuel Delivery Application System is not without limitations:

Safety limitations: Fuel is a highly flammable and hazardous material, so there are a number of safety concerns that need to be addressed when delivering it. This includes ensuring that the fuel is stored and transported in a safe manner, and that the delivery drivers are properly trained in safety procedures.

Cost limitations: Fuel delivery applications need to invest in specialized vehicles and equipment to safely transport fuel. This can be a significant upfront cost, which may make it difficult for new entrants to the market.

Regulatory compliance limitations: Fuel delivery applications need to comply with a number of regulations, which vary from country to country. This can be complex and costly, and it can also be a barrier to entry for new businesses.

Limited availability limitations: Fuel delivery applications are currently only available in a limited number of locations. This is due to the safety and regulatory challenges involved.

Customer awareness limitations: Many people are not yet aware of fuel delivery applications as an option. This means that businesses need to invest in marketing and education to raise awareness of their services.

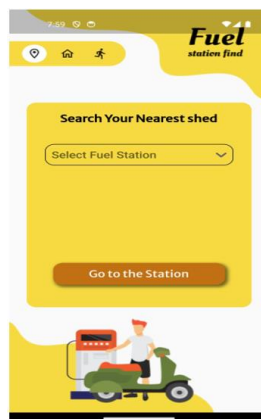

Fig. 6. Nearest Petrol Pump Page

CONCLUSION

In conclusion, The Fuel Delivery Application project has the power to completely change how fuel is obtained and used by individuals. The application can prioritize security, privacy, and sustainability while meeting the increasing demand for alternative fuel sources. It does this by offering a smooth, user-friendly, and efficient fuel delivery service.

The report's suggested improvements have the potential to greatly improve the application's functionality and establish it as a top supplier of fuel delivery services. The user experience will be made even more simple and convenient by adding voice-activated controls, smart home integration, personalized recommendations, and AR fuel level visualization.

The application's functionality will be expanded to support alternative fuel sources like electricity, hydrogen, and biofuels in order to meet the increasing demand for environmentally friendly transportation choices. Furthermore, investigating pre- dictive maintenance methods and autonomous fuel delivery systems can greatly increase operational effectiveness and decrease downtime.

To ensure that the application runs with the highest integrity and environmental responsibility, security, privacy, and sus-tainability are prioritized through improved data protection, blockchain-based transactions, eco-friendly delivery routes, and data anonymization.

As the Fuel Delivery Application project develops further, it has the potential to completely change the fuel delivery market by providing customers looking for a more eco-friendly and streamlined fuel delivery experience with a sustainable, easy-to-use solution. The application has the potential to significantly influence how fuel is delivered in the future and help create a more user-friendly, sustainable transportation environment.

ABSTRACT

Dream Destination VR is an innovative virtual reality (VR) project that transforms the travel industry by offering immersive and unforgettable travel experiences from the comfort of home. Through the use of VR technology, users can explore beautiful and exotic locations around the world, interacting with different landscapes and cultures. The project features meticulously crafted 3D environments, realistic soundscapes, and interactive content. The system utilizes Cardboard VR to make VR tourism more accessible to a broader audience by leveraging low-cost VR technology. Users can automatically explore diverse destinations within virtual reality environments without the need for manual navigation, creating a seamless and engaging experience. Dream Destination VR goes beyond sightseeing by offering educational and cultural insights. Through interactive guides and narratives, users learn about the history, culture, and ecology of each destination, creating a meaningful connection with the world. The project's focus on affordability and user-friendly experiences democratizes VR tourism, allowing more people to embark on virtual adventures and discover the world's beauty from their own homes.

KEYWORDS

virtual reality, 3D environments, Cardboard VR, low-cost VR technology, manual navigation.

INTRODUCTION

This innovative project harnesses the power of virtual reality (VR) to transport users to the world's most awe-inspiring locations. Imagine feeling the crisp mountain air on one's face while virtually hiking the Inca Trail. Picture individuals marveling at the dazzling array of marine life as they swim alongside virtual schools of fish. Dream Destination in VR brings these experiences to life with stunning visuals, immersive soundscapes, and interactive elements. Gone are the days of flipping through travel brochures or watching documentaries. VR tourism allows participants to step into the heart of the action. Whether one is a seasoned adventurer or an armchair traveler, Dream Destination in VR has something for everyone. Explore iconic landmarks, delve into diverse cultures, and discover hidden gems – all from the comfort of a VR headset. Dream Destination in VR isn't just about sightseeing; it's about education and connection. Learn about the history, culture, and ecology of each destination through interactive guides and informative narratives. Feel a sense of connection to the world around as individuals virtually interact with local communities and witness their unique customs.

Imagine standing on the rim of the Grand Canyon, marveling at its vastness and natural beauty, or exploring the vibrant coral reefs of the Great Barrier Reef and swimming alongside colorful marine life. With Dream Destination in VR, users can virtually hike ancient trails, such as the Inca Trail, and experience the thrill of adventure while being surrounded by lush landscapes. The project goes beyond simple sightseeing, providing a comprehensive educational experience. Participants can learn about the history, culture, and ecology of each destination through interactive guides and informative narratives. Dream Destination in VR also offers opportunities for users to virtually interact with local communities, witnessing their

unique customs and traditions, fostering a sense of connection and appreciation for diverse cultures.

It offers stunning visuals and immersive soundscapes that make users feel as if they are actually in these locations. The project provides interactive elements such as guided tours and informative narratives about the history, culture, and ecology of each destination. Users can virtually explore iconic landmarks, swim with marine life, and delve into diverse cultures. Dream Destination in VR also offers opportunities to interact with local communities and witness their customs, fostering a sense of connection to the world. The project appeals to both seasoned traveler and armchair explorers, providing an engaging and educational experience for all.

VR allows users to explore destinations in a fully immersive way. Imagine standing atop the Eiffel Tower, looking down at the bustling streets of Paris, or walking through the ruins of Machu Picchu, all within a virtual space. Educational content is a significant component of VR tourism. Users can learn about the history and culture of a place through interactive storytelling and gamified elements. One of the most important benefits of VR tourism is its ability to make travel accessible to those who may be unable to do so physically. This includes individuals with disabilities, the elderly, or those with financial constraints. VR tourism fosters a sense of global connectivity by allowing users from around the world to meet and share experiences within a virtual space. For tourism businesses, VR serves as a powerful marketing tool. It allows potential visitors to preview destinations and facilities, which can entice them to plan a real visit in the future.

RELATED WORK

Despite the growing interest and discussions on Virtual Reality (VR) and Augmented Reality (AR) in tourism, we do not yet know systematically the knowledge that has been built from academic papers on VR and AR in tourism; if and how VR and AR research intersect, the methodologies used to research VR and AR in tourism, and the emerging contexts in which VR and AR have surfaced in

tourism research. By conducting a systematic literature review on VR/AR research in tourism, this work seeks to answer five main research questions: (1) Which tourism sectors and contexts have VR and AR research emerged in?; (2) Which forms of VR and AR have garnered the most attention in tourism research?; (3 and 4) What methodologies/theories are being utilized to research VR and AR in tourism?; and (5) What are the research gaps in VR and AR tourism research? From a synthesis of 46 manuscripts, marketing and tourism education emerged as the most common contexts. However, issues with heterogeneity appeared in terminology usage alongside a lack of theory-based research in VR and AR. Also, gaps were identified where challenges identified revolved around awareness of the technology, usability, and time commitment. Virtual reality (VR) technology has introduced a range of equipment, contexts, and stimuli with possible applications in the context of design creativity. In response, recent studies have investigated VR as a tool that can be applied to enhance creativity. As a part of such research, this paper reviews existing studies and provides a state-of-the-art literature review based on the componential theory of creativity. Based on studies that investigate the use VR to enhance creativity, we found that VR can be used to improve specific factors to enhance creativity, and a natural environment can be considered a positive factor for enhancing creativity. Therefore, we propose a hypothesis that VR technology could be a useful method to simulate nature for enhancing creativity; experimentation based on the hypothesis is expected to be conducted in the future. Learning can be performed in various ways and can utilize different technologies. This paper presents a review of current and previous research to understand the use of virtual reality technology for learning. This paper used a systematic literature review (SLR) as a method. Research question (RQ) was determined in the first step. The query for searching the previous research on popular database journals was generated from previously created RQ. Popular journals included IEEE Xplore, ScienceDirect, SpringerLink, Scopus, and ACM Digital Library. Thirty-two related articles were

produced from the search, then reviewed. The study concluded that there were four purposes of using virtual reality for learning, two types of devices used, and two types of user experiences. Since the first time the term "Virtual Reality" (VR) has been used back in the 60s, VR has evolved in different manners becoming more and more similar to the real world. Two different kinds of VR can be identified: non-immersive and immersive. The former is a computer-based environment that can simulate places in the real or imagined worlds; the latter takes the idea even further by giving the perception of being physically present in the non-physical world. While non-immersive VR can be based on a standard computer, immersive VR is still evolving as the needed devices are becoming more user friendly and economically accessible. In the past, there was a major difficulty about using equipment such as a helmet with goggles, while now new devices are being developed to make usability better for the user. VR, which is based on three basic principles: Immersion, Interaction, and User involvement with the environment and narrative, offers a very high potential in education by making learning more motivating and engaging. Up to now, the use of immersive-VR in educational games has been limited due to high prices of the devices and their limited usability. Now new tools like the commercial "Oculus Rift", make it possible to access immersive-VR in lots of educational situations. This paper reports a survey on the scientific literature on the advantages and potentials in the use of Immersive Virtual Reality in Education in the last two years (2013-2014). It shows how VR in general, and immersive VR in particular, has been used mostly for adult training in special situations or for university students. It then focuses on the possible advantages and drawbacks of its use in education with reference to different classes of users like children and some kinds of cognitive disabilities (with particular reference to the Down syndrome). It concludes outlining strategies that could be carried out to verify these ideas. As virtual reality (VR) sees an increase in use in several domains such as retail, education, military; a secure authentication scheme for VR devices is necessary to keep users' personal information safe. A smaller

section of research focuses on the authentication schemes of VR devices. To further the understanding of this topic, we conducted a detailed literature review of VR authentication by exploring papers published till October 2020. A total of $N = 29$ papers were found. While many papers evaluate the accuracy of authentication methods, few conduct detailed user studies. In the user studies done, we found a lack of focus on diverse populations such as the elderly, with the mean age of the participants being 25.11. Our findings from the literature review give a detailed overview of VR-based authentication schemes and highlight trends as well as current research gaps. These findings drive future research direction to create robust and usable authentication strategies.

EXISTING METHODOLOGIES

Existing systems in VR tourism offer immersive travel experiences through virtual reality headsets, providing users with the opportunity to explore real-world destinations remotely. These systems typically include VR headsets like Oculus Rift, HTC Vive, or standalone devices such as Oculus Quest, along with content creation tools like Unity3D or Blender for developing 3D models and virtual environments. Virtual reality (VR) tourism systems are a blend of hardware and software that work together to create immersive experiences, allowing users to explore real-world destinations without leaving their homes. VR tourism systems offer immersive travel experiences using virtual reality headsets, such as Oculus Rift, HTC Vive, and standalone devices like Oculus Quest. These headsets allow users to explore real-world destinations remotely, immersing them in visually stunning virtual environments. The systems combine both hardware and software elements to deliver these experiences. On the hardware side, the VR headsets provide users with an interactive and engaging way to experience different locations. On the software side, content creation tools like Unity3D and Blender are used to develop 3D models and virtual environments that replicate actual destinations. This combination of advanced technology allows users to virtually visit places around the world, offering

them a sense of presence and interactivity that goes beyond traditional forms of tourism. Through VR tourism, users can experience various cultural, historical, and natural wonders from the comfort of their homes, making travel more accessible to a wider audience.

PROPOSED METHODOLOGIES

The proposed system for VR tourism developed for Cardboard VR represents a significant advancement in making immersive travel experiences accessible to a wider audience through low-cost VR technology. By leveraging the simplicity and affordability of Cardboard VR, the system opens doors for individuals who may not have access to high-end VR headsets like Oculus Rift or HTC Vive. The key innovation lies in the system's ability to automatically showcase various destinations and places within virtual reality environments, eliminating the need for manual navigation. This feature enhances user experience by allowing them to effortlessly explore diverse destinations without having to manipulate controllers or interact with complex menus. Instead, users can simply immerse themselves in the virtual environments and let the system guide them through captivating landscapes, iconic landmarks, and cultural attractions. By streamlining the user experience and removing barriers to entry, the proposed system holds the potential to democratize VR tourism, enabling more people to embark on virtual adventures and discover the beauty of the world from the comfort of their own homes. The system is designed to automatically showcase various destinations and places within virtual reality environments without the need for manual navigation.

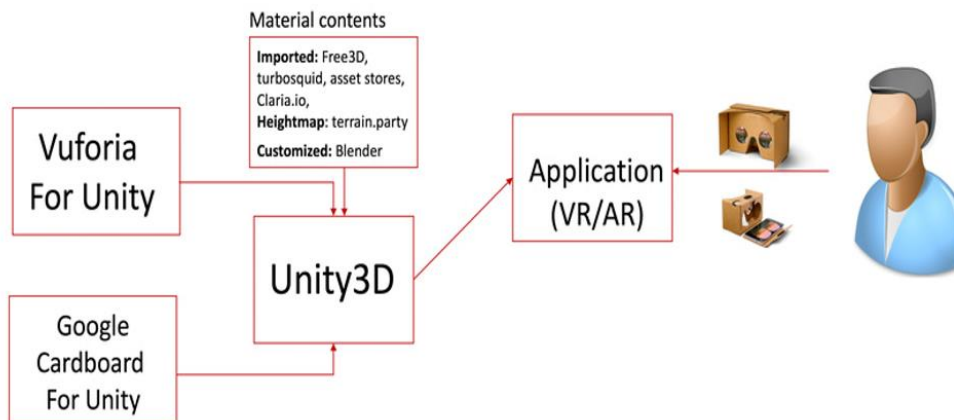

The key innovation of this system is its automatic showcasing of various destinations and places within virtual reality environments. This means that users can experience different locations without needing to manually navigate or interact with complex menus. Instead, the system guides users through captivating landscapes, iconic landmarks, and cultural attractions, providing a seamless and effortless experience. By streamlining the user experience and making VR tourism

more user-friendly, the proposed system removes barriers to entry and enhances the overall experience. This approach has the potential to democratize VR tourism, allowing more people to embark on virtual adventures and explore the world's beauty from the comfort of their own homes. As a result, the system opens up new possibilities for individuals to connect with diverse cultures and destinations in an immersive and engaging way. One of the standout features of this system is its ability to automatically guide users through various destinations and virtual reality environments. This automatic navigation feature enhances the user experience by allowing individuals to relax and enjoy the journey without needing to interact with controllers or navigate menus. Instead, the system seamlessly transitions users between different destinations, creating a natural flow that mimics a real-world travel experience. The virtual environments are designed to be captivating and immersive, showcasing a variety of landscapes, landmarks, and cultural attractions from around the world. Users can virtually visit places such as the bustling streets of Tokyo, the serene beaches of Bali, or the majestic mountains of the Swiss Alps. The system provides a sense of presence and wonder as users explore these diverse destinations.

By making VR tourism more accessible and user-friendly, the proposed system helps to democratize the experience of exploring the world through virtual reality. This opens up opportunities for individuals who may have physical or financial limitations that prevent them from traveling in real life. Additionally, it provides a safe and convenient alternative to traditional travel, especially in situations where travel may be restricted.

The system also has the potential to support educational and cultural initiatives by offering virtual field trips and experiences that allow users to learn about different cultures, histories, and ecosystems. This further enhances its appeal as a tool for schools, museums, and other educational institutions. Overall, the proposed system for VR tourism developed for Cardboard VR holds great promise in transforming

the way people experience travel and culture, making it more inclusive and accessible for all.

Model construction and prediction

XR Plugin Management: Unity provides an XR Plugin Management system that simplifies the integration of different VR and AR platforms, such as Oculus, HTC Vive, and others. Developers can easily switch between different VR platforms using this system.

Unity VR SDKs: Unity supports multiple VR Software Development Kits (SDKs) for different VR platforms. These SDKs provide the necessary tools and APIs to interact with VR hardware and input devices.

VR Camera and Rig: Unity offers specialized camera and rig setups for VR development. These include stereo rendering for each eye and customizable head tracking, allowing developers to create immersive 3D environments.

Physics and Collision Detection: Unity's physics engine can be utilized to create realistic interactions within VR environments, including object collisions and interactions with the virtual world.

User Input and Interaction: Unity supports various input devices such as motion controllers, gamepads, and hand tracking devices. Developers can create intuitive user interactions within VR environments using Unity's input systems.

3D Asset Management: Unity provides a comprehensive suite of tools for importing, managing, and optimizing 3D models and assets. These assets can be used to create realistic and visually stunning VR environments.

Lighting and Shading: Unity's advanced lighting and shading features allow developers to create realistic and immersive VR scenes. This includes support for real-time and baked lighting, as well as shader programming.

Spatial Audio: Unity supports spatial audio, which provides realistic and immersive soundscapes that enhance the VR experience. Developers can position audio sources in 3D space to create a sense of depth and directionality.

Animation: Unity's animation system can be used to create lifelike movements and interactions for characters and objects in VR environments.

Performance Optimization: Unity offers various tools and features for optimizing VR applications, such as occlusion culling, LOD (level of detail), and GPU instancing. These help maintain smooth performance in VR experiences.

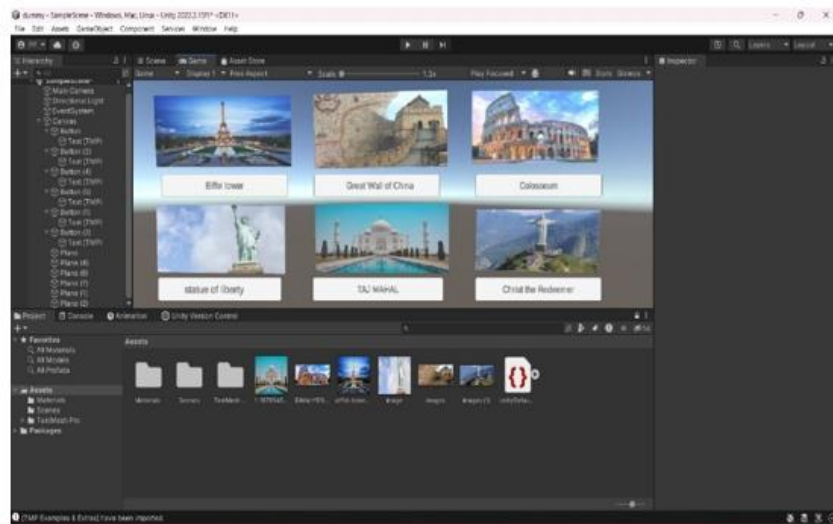

Networking and Multiplayer: Unity's networking capabilities can be used to create multiplayer VR experiences, allowing users to interact with each other in shared virtual environments.

CONCLUSION

The system for VR tourism designed for Cardboard VR represents a groundbreaking leap towards inclusivity and accessibility in immersive travel. By leveraging affordable technology and automated navigation, it empowers users to explore diverse destinations effortlessly. This democratization of VR tourism not only enriches individual experiences but also fosters global cultural exchange, promising to connect people from all walks of life in virtual exploration and discovery.

FUTURE ENHANCEMENT

In the future, the VR tourism project could integrate features such as personalized recommendations based on user preferences, interactive elements within virtual environments, and social integration for shared exploration experiences. Additionally, expanding compatibility to other platforms, implementing user-generated content, ensuring accessibility features, and integrating real-world services would further enrich the overall user experience, making virtual travel more immersive, inclusive, and engaging.

ABSTRACT

In the actual world of today, automatic frameworks are preferred to human framework. IoT is the most recent and growing online innovation, and the exponential rise in the quantity of internet users during the previous decade has transformed the internet into a vital aspect of modern life. necessity for daily living. One of a person's basic needs is electricity, which is frequently used for household, commercial, and agricultural reasons. The greatest issue today is power theft, which costs energy companies a lot of money and creates some payment issues for customers. These circumstances occur more frequently in our nation. Lots of electricity can be conserved if these thefts are stopped. Utilizing a smart energy meter, this is done (SEM). An electronic instrument called a SEM has an energy metre chip for calculating the amount of electricity used and using a cellular algorithm for data transmission. A smart energy metre for an automated metering and invoicing system is presented in this study. This energy metre communicates with the controlling base station and sends the power used and the associated number to both the consumers and the electricity board via an Android application and a web application, respectively. To assist vendors in looking into, identifying, and stopping theft, additional policy measures and suggestions are included. The entire system helps prevent crimes and uses a worldwide linked means to effectively portray the

metre measurement to its clients. IOT devices are used for contact between the user/household and the centre.

KEYWORDS

IOT Module, Arduino microcontroller, Current Sensor

INTRODUCTION

Home energy management systems (HEMS) play a crucial role in balancing energy conservation with maintaining a comfortable lifestyle within households. Beyond simply reducing energy consumption by utilizing sensors and other data sources to identify unnecessary energy usage and regulating home appliances accordingly, HEMSs also optimize the use of electricity by, for example, scheduling the operation of heat pump water heaters or washer-dryers during periods of surplus solar power generation. With the increasing contribution of renewable energy sources reliant on factors like rainfall, the integration of batteries and their efficient operation will become pivotal in ensuring a reliable supply of electricity. Additionally, HEMSs provide visual representations of electricity usage, allowing homeowners to monitor their consumption easily through television or computer screens. By centrally managing energy consumption, these systems can also offer tailored advice on optimizing electricity usage based on factors such as rainfall patterns or the homeowner's behavior.

EXISTING METHODOLOGY

A cutting-edge solution for simplifying household energy consumption and optimizing power usage via power line transmission has been developed. This innovative system includes a module designed to control various connected household appliances, thereby enabling efficient management of electricity usage. This system is known as a Green Household Appliance Monitoring and Management System (HEMS).

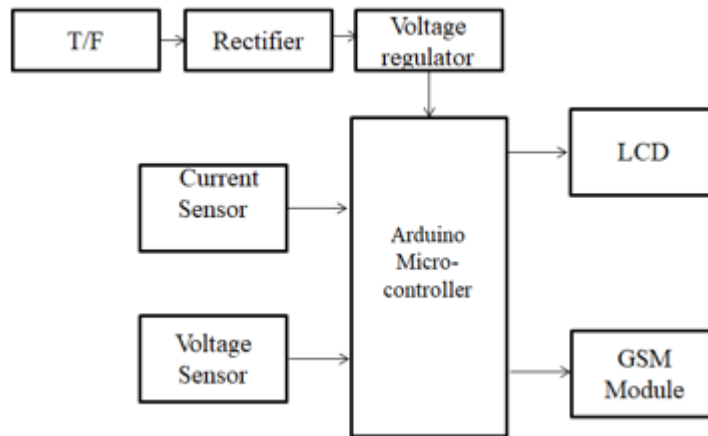

Fig .1. Block Diagram of the Existing System

As the prevalence of renewable energy production and storage systems increases, it's imperative for the power system to effectively manage demand response and load balancing, utilizing power storage devices. These systems integrate electricity generated from green energy sources with that supplied by traditional utilities. However, integrating renewable energy sources into existing power networks presents challenges such as managing varying frequency and voltage. Therefore, extensive research on distribution and transmission is essential to successfully incorporate green energy infrastructure into the grid.

PROPOSED METHODOLOGY

This paper introduces a novel home automation system designed to provide users with autonomous control over various lights and utilities in their homes. By integrating multi-touch mobile devices, cloud networking, wireless communication, and power-line communication, the proposed framework offers seamless functionality. It includes a mobile application, a handheld cordless remote, and computer-based software to facilitate intuitive interaction for users. With its server and sensors, this decentralized system enhances efficiency and convenience, empowering users with enhanced control over their living environment.

BLOCK DIAGRAM

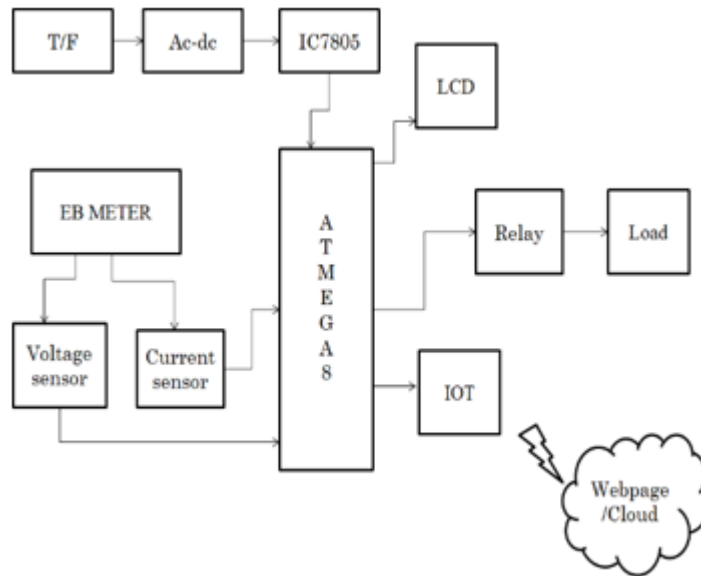

Fig.2. Block Diagram of The Proposed System

The server serves as the central hub for managing and monitoring various instruments, with the flexibility to easily accommodate additional hardware interface modules, such as sensors. It interfaces with an online server where credit card information is entered securely. Users within the same Local Area Network (LAN) can access the Automation System through their web browsers using the server's IP address. Additionally, remote access is facilitated from any computer or mobile device compatible with the server's internet IP address. The network architecture utilized for connecting the server and devices is based on WiFi technology. WiFi offers enhanced mobility, scalability, and security for the system through secure wireless connections. Leveraging IoT (Internet of Things) technology, the system enables the tracking and management of various physical objects and electronic devices via the internet, marking a significant advancement in technology integration and automation. IOT enables users to easily manage non-digital objects via an inviting GUI over the internet. We are among the innovators conducting study in the internet of things. Our efforts are focused on studying cutting-edge IoT

initiatives that could be beneficial to humanity. Students and scholars can be inspired by these IoT project ideas to conduct additional IoT study.

SYSTEM MODEL

Node MCU

Fig.3 Node MCU

NodeMCU is an open-source firmware and development board built primarily for Internet of Things (IoT) applications. It utilizes the Lua programming language and is tailored to support the ESP-12 module and firmware designed for the Espressif Systems ESP8266 Wi-Fi System-on-Chip (SoC). This combination of firmware and hardware enables developers to create IoT projects efficiently, leveraging the capabilities of the ESP8266 for wireless communication and connectivity.

LCD Display

Fig.4 LCD

LCD displays characters, numbers, and designs. The microcontroller's (P0.0–P0.7) I/O port is interfaced with the showcase. Multiplexed mode is used for the presentation. The next showcase flashes on in 1/tenth of a second. Because of Vision's diligence, the show will result in a continuous display of tally.

Current Sensor

Fig .5 Current Sensor

Current sensing, in the field of electrical engineering, refers to any of the various methods for measuring electric current. Current can be measured in tens of thousands of amperes to picoamperes. The criteria that determine which current sensing method to use include size, cost, isolation, robustness, precision, bandwidth, and robustness. An instrument may show the current value directly, or it may be digitally transformed and used by a control or monitoring system. Examples of current sensing techniques include shunt resistors, Rogowski coils, current transformers, magnetic field-based transducers, and other similar devices. These techniques are commonly employed in various applications to measure and monitor electrical current flow accurately and efficiently.

Power Supply

The 12V advanced step-down transformer is powered by an AC source. The 12V AC transformer is rectified by means of a diode connection. A capacitor separates the 12V DC diode bridge yield.

Arduino UNO R3 Microcontroller

Fig .6 Arduino Board

The Arduino Uno R3 is a versatile microcontroller board designed around the ATmega328 IC, catering to various electronics projects. Noteworthy features include six analog inputs, a 16 MHz crystal oscillator, and a USB port for seamless connectivity. With 14 digital input/output pins, six of which are PWM-enabled, it offers ample flexibility for interfacing with external devices. Moreover, it incorporates a reset button, an ICSP header for programming, and a power jack for easy power supply connections. Equipped with all necessary components, the board can operate with a power source like a battery, AC-to-DC adapter, or by connecting it to a computer via USB cable.

RESULTS AND DISCUSSION

These days, it's difficult to observe and monitor your power usage for verification because it takes a lot of work to routinely check the meter room. It is vital to ascertain if you are being charged similarly in order to ensure that the necessity is met.

To developed a technology that enables customers to keep an eye on energy meter readings via IOT.

The result system makes use of an energy meter and a microcontroller system to track energy use.

Units consumed, projected cost, line voltage, and current consumed are all tracked by the meter. The IoT webpage is a simple web application that displays the live output of these readings over the IOT.

This allows the user to easily examine the units used, projected cost, line voltage, and current used in real time from any location through the location. This makes it easy for clients to monitor charging on the IoT portal and appropriately screen power meter readings thanks to the energy meter observing framework.

CONCLUSION

The Internet of Things (IoT) has truly revolutionized home automation, offering unprecedented control and convenience. Through the integration of essential devices, we now have the ability to remotely manage our homes via the internet. This allows us to monitor crucial sensor data such as temperature, gas levels, light intensity, and even motion detection from any location. What's truly remarkable is the system's capability to automatically initiate actions based on specific conditions, like activating lights as night falls. Furthermore, the secure storage of sensor data in the cloud, accessible through platforms like Gmail, adds another layer of convenience. With this technology, we are empowered to oversee and regulate our homes regardless of our physical location or the time of day. It's an exciting glimpse into the future of smart living, where our homes seamlessly adapt to our needs and preferences.

ABSTRACT

Information security issues are the most important concerns in the information technology driven world. The security concern of electronic data becomes so important and the responsibility of cryptography has increased so much. This project introduces a novel approach to file-to-video encryption and decryption. The project explores the integration of Quick Response (QR) codes and Advanced Encryption Standard (AES) techniques to enhance the security of file transfers. The integration of QR codes introduces a practical dimension to the encryption process, capitalizing on their capacity to encode information efficiently and their user-friendly nature. QR codes are strategically employed to embed encrypted data within video files, streamlining the sharing and transmission process. Concurrently, the implementation of AES, a widely recognized cryptographic standard, ensures a high level of confidentiality and integrity for the encrypted data. By marrying the advantages of QR codes' accessibility with the cryptographic strength of AES, this project offers a comprehensive and innovative solution to the complex challenges associated with securing electronic data in an increasingly interconnected and information-driven world.

KEYWORDS

QR: Quick Response, AES: Advanced Encryption Standard, MD5: Message Digest Algorithm 5

INTRODUCTION

The need for secure and efficient methods of file transmission is paramount. This project presents an innovative solution that integrates Quick Response (QR) codes with Advanced Encryption Standard (AES) techniques to elevate the security and confidentiality of transmitted data. The conventional methods of file transfer often face challenges related to security vulnerabilities and the increasing sophistication of cyber threats. The project aims to address these concerns by introducing a novel approach that combines the visual efficiency of QR codes with the robust security of AES encryption.

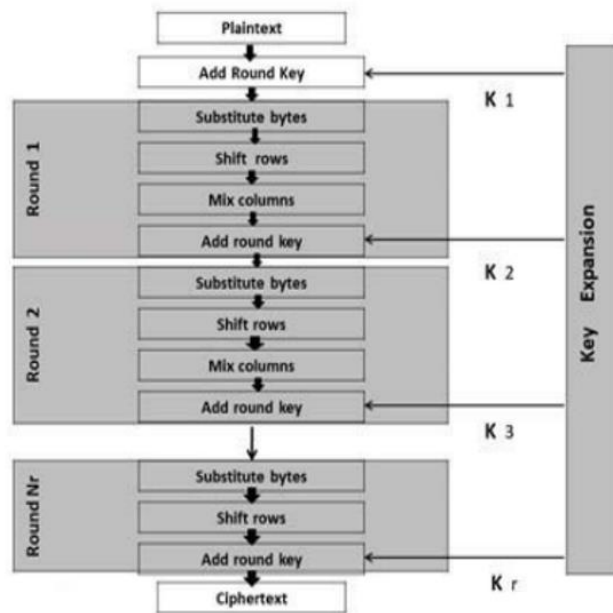

Amidst the surge in digital transactions and information sharing, the vulnerabilities of existing file transfer methods become more pronounced. This section delves into the dynamic challenges of the digital era, ranging from the relentless sophistication of cyber threats to the limitations of traditional encryption methods. Understanding these challenges forms the backdrop for the innovation introduced by this project. Beyond addressing immediate challenges, the project holds monumental significance in reshaping the narrative of secure file transfers.

The integration of QR codes and AES encryption positions as a transformative force with the potential to redefine data security paradigms across diverse sectors. This section explores the profound impact that could have on businesses, communications, and data-sharing practices, making it a catalyst for a secure digital future.

The fundamental objectives of AES data protection are elucidated to provide a clear understanding of the project's focus areas. These objectives include enhancing the security of file transfers, employing QR codes for efficient data representation, conducting a comparative analysis against existing methods, and designing a user-friendly interface. Each objective contributes to the overarching goal of creating a comprehensive and effective solution. This involves integrating Quick Response (QR) code generation with the Advanced Encryption Standard (AES) algorithm to

ensure robust encryption of file content. The project aims to explore the capacity of QR codes for representing file chunks and to develop a mechanism for converting these encrypted chunks into a video format.

Advanced Encryption Standard (AES): Due to evolution in internet technology, highly secure algorithms are needed. As there are many weaknesses in RSA, DES and 3 DES replacement of these algorithm was needed. So AES was selected as more secure algorithm. AES is based on concept of substitution and permutation. Three types of key options are available in AES as 128 bits, 192 bits and 256 bits with round set of 10,12 and 14 respectively.

PROPOSED METHODOLOGY

The proposed system represents a groundbreaking approach to file transmission by seamlessly integrating QR codes with AES encryption. This dual-layered strategy combines the visual efficiency of QR codes with the robust security measures of AES, creating a comprehensive solution that addresses the shortcomings of the existing system. To fortify the security of file transfers, the system employs AES encryption. This cryptographic technique ensures that the content of files remains confidential and secure throughout the transmission process. The integration of AES encryption

enhances data protection, mitigating the risks associated with unauthorized access and cyber threats. Recognizing the importance of user experience, the system features a user-friendly interface. Intuitive design elements, clear navigation paths, and a simplified user journey contribute to a seamless and accessible file transfer experience. The focus on user-friendliness is a core element that distinguishes the proposed system from its predecessors. The system, with its integration of QR codes and AES encryption, emerges as a comprehensive solution to the challenges associated with conventional file transmission methods. By combining visual efficiency with robust security measures, the proposed system addresses the shortcomings of existing systems and establishes itself as a versatile and effective approach to secure file transfer.

ADVANTAGES

Integration of Advanced Encryption Standard (AES) ensures robust data security.

Confidentiality of transmitted files is maintained, mitigating the risk of unauthorized access.

Optimization of data representation through QR codes accelerates encoding and decoding processes.

Integration of QR codes provides a visual representation of data.

The combination of QR codes and AES encryption creates a comprehensive solution.

DESCRIPTION

In contemporary digital landscapes, secure and efficient file transmission is a critical concern. Traditional methods often face challenges related to security vulnerabilities, potential data breaches, and the need for streamlined processes. The project addresses these issues by proposing a novel solution that integrates Quick Response (QR) codes with Advanced Encryption Standard (AES) techniques. This section defines the specific problems the project aims to solve, emphasizing the

importance of enhancing file transmission methods. The vulnerabilities associated with conventional file transmission methods, including the risk of unauthorized access and potential data breaches, highlight the necessity for a more secure approach. The inefficiencies inherent in traditional file transfer processes, such as time-consuming procedures and complex encryption methods, contribute to the need for a streamlined and efficient solution.

OVERVIEW

The project offers a comprehensive solution to the identified problems, combining the visual efficiency of QR codes with the robust security measures provided by AES encryption. This section provides an overview of the key components, features, and objectives of the project, setting the stage for the subsequent chapters that delve into the technical details, implementation, and evaluation of the system. A detailed exploration of the features and objectives of the project, emphasizing the enhancement of security, optimization of data representation, and the creation of a user-friendly interface. An overview of how the project integrates QR codes for efficient data representation and employs AES encryption for enhanced security, highlighting the synergies between visual representation and data protection. A sequential depiction of the workflow within the system, illustrating the steps involved in file selection, QR code generation, AES encryption, video conversion, and user interaction. An introduction to the advanced features of the system, including decryption capabilities, customizable encryption settings, and additional security measures.

MODULES DESCRIPTION

This chapter provides a comprehensive description of the key modules that constitute the system. Each module plays a crucial role in the overall functionality and success of the project, contributing to the secure and efficient transmission of

files. The following sections detail the purpose, features, and interactions of each module within the system.

QR Code Generation Module:

The QR Code Generation Module is responsible for converting file data into Quick Response (QR) codes. This module employs sophisticated algorithms to break down files into manageable chunks, creating corresponding QR codes for each chunk. The key features of this module include:

File Chunking Algorithm: Efficiently divides large files into smaller, manageable chunks for QR code representation.

QR Code Generation: Utilizes QR code generation algorithms to create visually efficient representations of file chunks.

Data Integrity Check: Ensures the integrity of the data during the chunking and QR code generation processes.

AES Encryption Module:

The AES Encryption Module is integral to the security measures implemented in the system. Leveraging the Advanced Encryption Standard (AES), this module encrypts the file chunks represented by QR codes. The features of this module include:

AES Encryption Algorithm:

Implements the widely recognized AES encryption algorithm for robust data security.

Key Management:

Manages encryption keys securely to ensure the confidentiality of the encrypted content.

Decryption Capability:

Provides authorized users with the capability to decrypt and retrieve the original file from the video sequence.

Video Conversion Module:

The Video Conversion Module transforms the encrypted QR-coded file chunks into a video format. This module plays a pivotal role in creating a cohesive and visual representation of the encrypted data. Key features of this module include:

Integration with QR Codes:

Seamlessly integrates QR-coded file chunks into the video conversion process.

Frame Rate Control:

Manages the frame rate to ensure a smooth and comprehensible video representation.

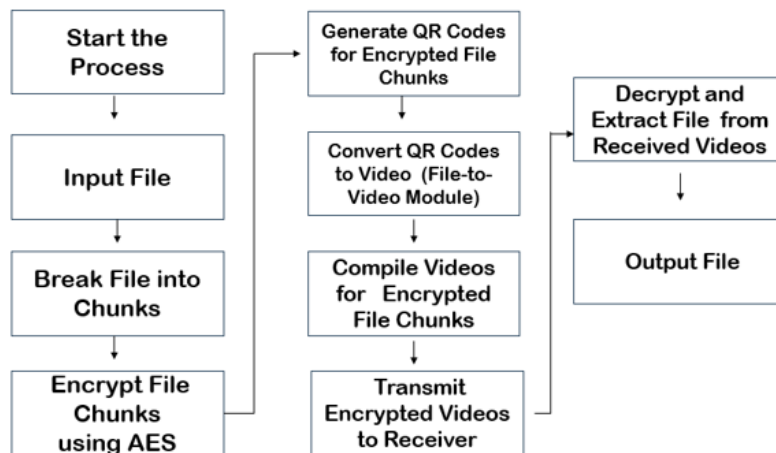

Video Output Formats:

Supports various video output formats to enhance compatibility

The QR Code Generation Module, as the initial stage, takes user-selected files, breaks them into manageable chunks, and generates corresponding QR codes using Python's `qrcode` library. The AES Encryption Module, emphasizing data security, employs the Advanced Encryption Standard algorithm to encrypt these chunks, enhancing the confidentiality of the transmitted information. The cryptography library in Python ensures the implementation of robust encryption. The Video Conversion Module is responsible for integrating the encrypted QR-coded file chunks into a cohesive video format, leveraging the OpenCV library for video processing. This step not only provides a visual representation of the encrypted data but also ensures compatibility across various platforms and devices. Effective communication between modules is facilitated by Python's built-in mechanisms, ensuring a smooth flow of data between the QR Code Generation, AES Encryption, Video Conversion, and User Interface modules. This modular approach enhances the system's maintainability, allowing for individual components to be upgraded or replaced without impacting the entire system. The emphasis on modularity, coupled with the use of established libraries and programming languages, establishes a foundation for a reliable, secure, and scalable system.

Security stands as a paramount consideration in the architecture of the project. The AES Encryption Module plays a pivotal role in ensuring the confidentiality of file data during transmission. This module employs the Advanced Encryption Standard algorithm, a widely recognized and robust encryption technique. Special attention is given to the secure management of encryption keys to prevent unauthorized access. The entire system is intricately designed to handle data securely throughout its lifecycle, encompassing processes such as file chunking and video conversion. By implementing rigorous security measures, aims to provide users with a trustworthy and safeguarded platform for file transmission.

FLOW DIAGRAM

CONCLUSION

In conclusion, the project represents a significant stride in the realm of secure and efficient file transmission. The integration of Quick Response (QR) codes with Advanced Encryption Standard (AES) techniques has resulted in a robust system that addresses key challenges in contemporary data transfer methods.

The modular architecture, with distinct components for QR code generation, AES encryption, video conversion, and user interaction, contributes to the system's adaptability and maintainability. The error-handling mechanism ensures a seamless user experience by promptly addressing potential issues and providing transparent

error messages. Security considerations take center stage in as evidenced by the meticulous implementation of the AES Encryption Module. The emphasis on secure key management and the holistic approach to data security, from file chunking to video conversion, underscores the commitment to safeguarding user data. Testing, a critical phase in system development, follows a comprehensive strategy encompassing unit testing, integration testing, and user acceptance testing. This rigorous testing approach ensures the reliability, efficiency, and user-friendliness of the system.

As technology continues to advance, the project stands as a testament to the importance of innovative solutions in enhancing data security and user experience. By seamlessly integrating QR codes and encryption techniques, SecureQR not only addresses current challenges but also sets a foundation for secure and efficient file transmission in the digital landscape. The project's success lies not only in its technical prowess but also in its user-centric design and commitment to data integrity and confidentiality.

ABSTRACT

This article introduces "One Point Student Verification," a mobile application created to improve the efficiency of employment recruitment and transform the student verification procedure. Delays, mistakes, and a lack of centralization characterize the present manual approach, which depends on paperwork and physical records. By presenting a safe and intuitive mobile application, this initiative solves these drawbacks.

KEYWORDS

Student Verification, Mobile Application, Job Recruitment, National Academic Repository, Cloud Firestore and Firebase.

INTRODUCTION

The "One Point Student Verification" initiative uses a cutting-edge mobile application to transform labour-intensive manual student verification procedures. Technology intervention is required since present manual verification systems are inefficient, slow, and prone to fraud. This idea suggests a cutting-edge mobile application to expedite procedures, cut down on delays, and improve security by utilizing specialist knowledge in student verification and recruitment. Personalized

job alerts for students, an effective categorization system, and interaction with the National Academic Repository for strong verification are some of the key features. The technology offers increased student verification and recruitment processes that are more connected, accurate, and efficient.

DOMAIN KNOWLEDGE

Job Recruitment

The process of finding, vetting, and choosing applicants for job openings is known as job recruitment. Recruiters encounter difficulties in effectively aligning candidate qualifications with job needs in the current competitive employment market. Through an understanding of the dynamics of hiring, talent requirements, employer expectations, and changing hiring trends, the project may customize its solution to optimize the hiring process. Using technology like automated resume parsing, AI-driven candidate screening, and predictive analytics can improve the efficacy and efficiency of hiring processes.

Student verification

The processes used to verify the legitimacy and authenticity of academic credentials, such as degrees, diplomas, and transcripts, are collectively referred to as student verification. Processes for manual verification are frequently laborious, prone to mistakes, and vulnerable to fraud. Through a thorough examination of the complexities involved in student verification, such as certification validation, document authentication, and regulatory compliance, the project will be able to develop strong methods for confirming student credentials. Student verification procedures can be made more secure and reliable by utilizing technology like blockchain, biometrics, and secure data repositories.

Mobile Application Development

The process of developing software applications especially for mobile platforms, such tablets and smartphones, is known as mobile application development. Programming language proficiency, UI design knowledge, and platform-specific

awareness are prerequisites for creating a mobile application. The project may provide a feature-rich and user-friendly application by grasping the fundamentals of mobile application development, such as responsive design, simple navigation, and smooth connection with backend services. Using native development tools for iOS and Android platforms or frameworks like Flutter or React Native can speed up development and guarantee top performance in a variety of device scenarios.

LITERATURE SURVEY

The review of the literature includes a wide range of research endeavours , all of which provide insight into important facets of algorithmic implementations and the difficulties they provide. The study conducted by Mpela and Zuva [6] on content-based filtering algorithms highlights the importance of user input in shaping the design of personalized recommendation systems.

The study conducted by Shah et al. [2] on the adoption of Hyperledger highlights the technology's importance in contemporary technological environments and recommends its incorporation to tackle new issues. The REST Client [5] algorithm's dependencies and corresponding learning curves are highlighted by Mocar et al.'s study, which influences integration decisions. Brdesee's examination of E-Verification Guard [1] reveals the possibility of change-related resistance that could come with its deployment, leading to consideration of the dynamics of implementation in organizational settings. The review of the literature includes a wide range of research endeavours, all of which provide insight into important facets of algorithmic implementations and the difficulties they provide.

IDENTIFYING THE CHALLENGES

Manual Student Verification Processes

Advanced technology integration frequently faces a number of difficulties, from user acceptance to computational efficiency and security issues. These difficulties make it more difficult for algorithms and technologies to be seamlessly adopted and implemented in practical applications. For example, [1] e-verification guards may be resistant to change, therefore it's important to find solutions that take user acceptability and transitional barriers into account. In a similar vein, the significant processing costs associated with [3] blockchain technology underscore the necessity of resource optimization. [4] Resource-intensive multimodal biometrics highlight the need for biometric authentication systems to be more efficient..

Challenges and Vulnerabilities

[10] Flutter and Firebase Because firebase communication involves vendor lock-in, control limitations, and data security issues, a careful analysis of platform dependencies and security measures is required.

Multimodal biometrics show how resource-intensive they are, indicating that authentication systems should be made more efficient.

[9] Content-based filtering algorithms rely mostly on human input; they recommend a minimum amount of human involvement in order to function properly.

[6] Dependencies and learning curves are present in REST client implementations, necessitating user-friendly and straightforward designs.

Change-averse guards for e-verification need to find ways to overcome obstacles to user acceptance and transition.

SYSTEM OVERVIEW

A state-of-the-art method for resolving the issues with manual student verification and recruitment procedures is the Innovative Student Verification and Recruitment Solution (ISVRS). An overview of ISVRS is provided in this document, along with a list of its main advantages. ISVRS makes use of experience in mobile application development, recruitment, and student verification. It is vital to comprehend the nuances of these fields in order to develop a solution that is both successful and efficient. The manual processes of recruiting and verifying students are rife with inefficiencies, hold-ups, and fraud vulnerabilities. ISVRS uses technology to improve security and expedite procedures in an effort to lessen these problems.

System design

The suggested system has a client-server design, with the database and backend logic hosted on a central server, and the mobile application acting as the client interface. Scalability, adaptability, and centralized data and resource management are made possible by this design.

To protect the confidentiality and integrity of the data, secure channels are used for communication between the client and server. Alongside academic credentials, the system facilitates streamlined validation of certifications, including professional accreditations and training courses.

Administrators have the capability to verify certifications provided by firms, ensuring that only legitimate entities are granted access to the recruitment platform.

Real-Time Verification

The system facilitates instantaneous verification of academic credentials by seamlessly integrating with the National Academic Repository (NAR). Upon submission of educational documents by students, the system conducts immediate cross-referencing with the NAR database, expediting the verification process.

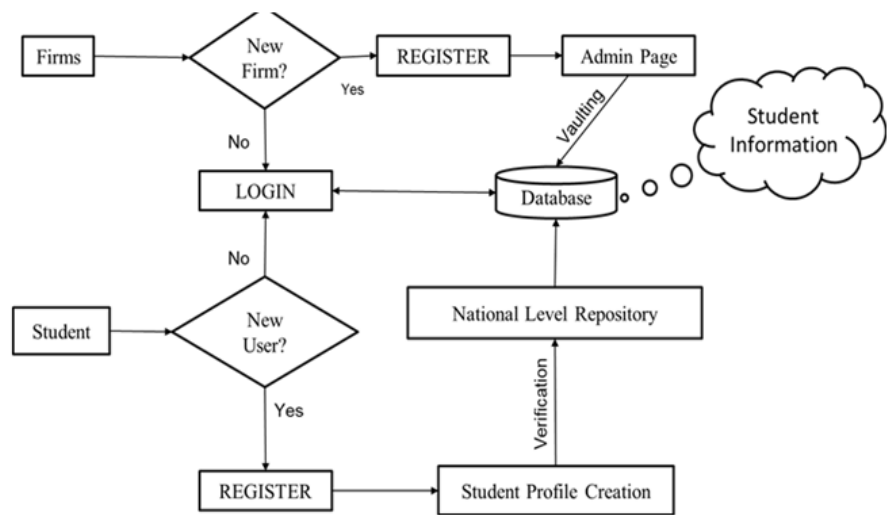

FIG.1

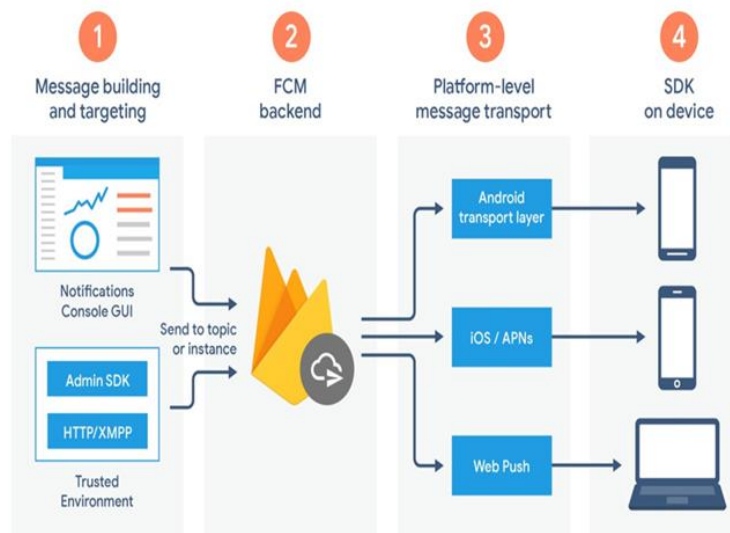

FIG.2

Real-time verification eliminates the need for manual checks, ensuring swift and efficient validation of academic qualifications.

Enhanced Verification for Participating Firms

Utilizing the integration with the NAR, administrators can validate the authenticity of firm credentials, business registrations, and relevant certifications. This enhanced verification process safeguards the integrity of the recruitment platform, ensuring that only reputable firms are represented, thereby fostering trust among recruiters and candidates alike.

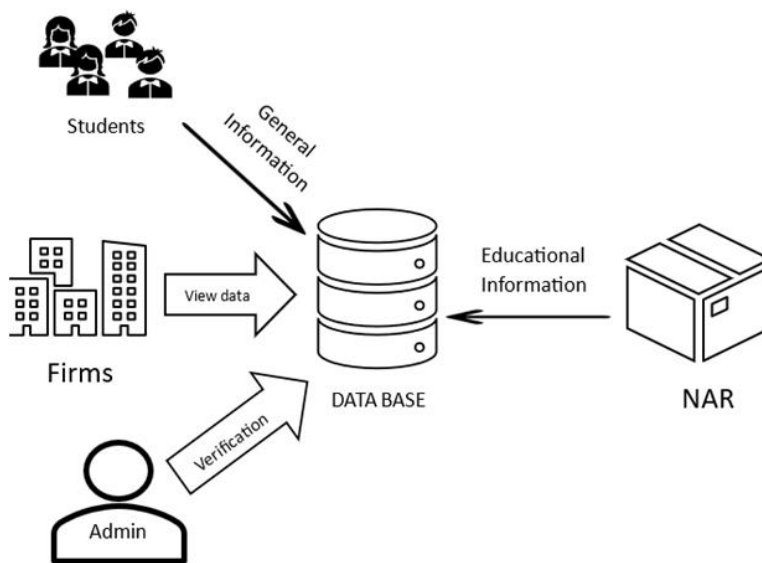

FIG.3

CONCLUSION

In summary, the system's integration with the National Academic Repository (NAR) allows for more efficient certification and qualification validation in addition to facilitating students' real-time verification of their academic credentials. This connection goes so far as to verify participating firms, giving administrators the ability to confirm the legitimacy and veracity of entities gaining access to the recruitment platform. The technology improves the efficiency, accuracy, and security of the verification process by utilizing the extensive database of the NAR. This, in turn, leads to a recruitment environment that is more transparent and reliable.

Recruiters, candidates, and participating organizations can interact with confidence knowing that the system maintains strict standards of authenticity and integrity since robust verification processes are in place. Therefore, the integration with the NAR is essential for promoting justice, dependability, and transparency.

ABSTRACT

This paper introduces a groundbreaking approach to the Recognition of Facial Stress System using Deep Learning, specifically leveraging the powerful DenseNet-121 model. The primary goal is to develop a resilient and real-time solution capable of identifying stress indicators through the intricate analysis of facial expressions. By training the model on a diverse dataset, encompassing a wide range of stress manifestations, the deep neural network becomes adept at recognizing key facial features associated with stress. Beyond accurate stress detection, the system incorporates an Intelligent Alert Mechanism, ensuring timely notifications based on the severity of stress levels detected. This project not only advances technology for mental health by providing an effective tool for stress monitoring but also exemplifies the potential of deep learning in enhancing our understanding of nuanced human emotions.

KEYWORDS

Facial expressions, Deep Learning, DenseNet-121 model, Stress detection, Intelligent Alert Mechanism

INTRODUCTION

Stress is a natural response to challenging or threatening situations, and its detection can be crucial for understanding and managing both short-term and chronic stressors. Advancements in technology have led to the development of wearable devices, mobile apps, and other tools that aim to monitor and detect stress in real-time. These technologies often leverage sensors and algorithms to analyze physiological and behavioural data and provide insights into an individual's stress levels. Stress detection can be valuable in diverse fields, including healthcare, workplace wellness, and personal well-being, allowing for timely intervention and the implementation of strategies to mitigate stress and promote overall mental and physical health. This model aims to leverage the power of neural networks to automatically detect stress patterns from various data sources, coupled with a real-time alert system to provide timely interventions and support. The architecture consists of several key components, each contributing to the overall effectiveness of stress detection and response.

LITERATURE SURVEY

Hung Bui and Lê Minh Tiến utilized a CNN-LSTM approach, yet encountered challenges due to a limited dataset, resulting in low accuracy. While their method showed promise, the constraints of the dataset hindered optimal performance [1].

Z. Zainudin, S. Hasan, S.M. Shamsuddin, and S. Argawal explored various machine learning techniques such as MLP, Decision Tree, K-Nearest Neighbour, Support Vector Machine, and Deep Learning algorithms. However, they faced limitations, particularly in representing certain types of relationships, such as linearly inseparable data. Despite the breadth of approaches, these techniques struggled with certain data configurations [4].

Fezile Ozdamli, Aayat Aljarrah, Damla Karagozlu, and Mustafa employed a ResNet-34 architecture but encountered difficulties in automatically detecting head and face movements. Despite the robustness of ResNet, its limitations became

evident in tasks requiring the automatic detection of subtle movements, particularly in facial expressions [3].

Hami Hadhri applied a Machine Learning approach using the SVM algorithm, yet faced a significant drawback as face emotions were not considered as input. While SVM showed promise in other aspects, the exclusion of crucial emotional cues limited its effectiveness in understanding nuanced human behavior [2].

PROPOSED SYSTEM

The Stress detection system operates by processing live feed frames from sources like webcams, utilizing a Facial Expression Recognition (FER) model for real-time facial expression analysis. Common stress-associated expressions are identified and compared with predefined emotional patterns using an FER model trained on the FER2013 dataset. The stress detection component employs DenseNet-121, a powerful deep neural network trained on the same dataset, to classify facial expressions as stressed or not stressed. Upon detecting stress, the system triggers a voice alert message, encouraging proactive stress management. This real-time loop ensures continuous monitoring and timely alerts for effective stress intervention.

ARCHITECTURE FLOW

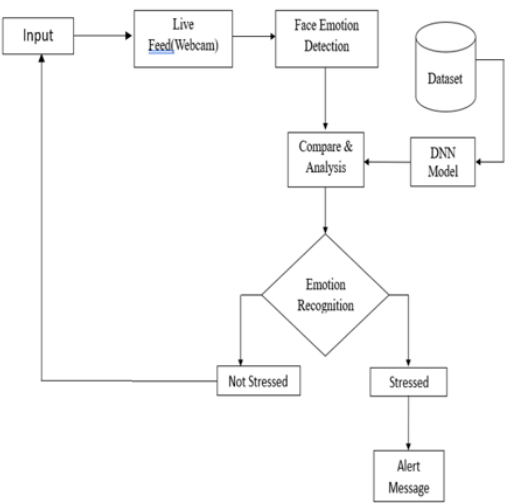

Fig. 1 System Architecture

MODULES

Data Preprocessing module

The 'ImageDataGenerator' is utilized for data augmentation, which involves applying various transformations to artificially expand the training dataset. And then the dataset is split into two subsets: training and validation sets.

Facial Expression Analysis module

The live feed frames are processed for facial expression analysis. This involves using a facial expression recognition (FER) model to detect and analyze facial expressions in each frame. Common facial expressions associated with stress, such as frowning, raised eyebrows, or tense facial muscles, are identified

Deep Learning Training module

The stress detection component utilizes a deep neural network (DNN) model, specifically DenseNet-121, which has been trained on the FER2013 dataset. DenseNet-121 is a convolutional neural network (CNN) architecture known for its efficiency and accuracy in image classification tasks.

Stress Detection module

Based on the classification result, a decision is made regarding the individual's stress level. If the DNN model classifies the facial expression as indicative of stress, the system proceeds to the next step. Otherwise, the loop continues analyzing subsequent frames.

Alert Mechanism module

If the person is classified as stressed, the system triggers a voice alert message. This alert can be a pre-recorded or synthesized message notifying the individual about their stress level. The alert aims to prompt the person to take proactive measures to manage stress.

OUTPUT

Fig. 2 the person looks like 'happy' so 'Not stressed' label is shown

Fig. 3 the person looks like 'sad' so 'Stressed' label with 'Low stress' level is shown

Fig. 4 the person looks like 'angry or frustrated' so 'Stressed' label with 'High Stress' level is shown

RESULT AND PERFORMANCE ANALYSIS

CONCLUSION

In conclusion, the integration of a deep learning model for stress detection, coupled with an alert system, presents a promising solution for addressing mental health challenges. The use of advanced neural network architectures, such as

DenseNet-121, allows the model to identify complex stress patterns from diverse data sources, leading to enhanced accuracy and efficiency in stress detection. The achieved accuracy of 96.95% is a notable success in accurately identifying stress-related patterns. The incorporation of a real-time alert system ensures timely notifications, empowering users to proactively manage stress. Overall, the API integration with camera-enabled devices underscores our commitment to democratizing access to mental health support and fostering a proactive approach to stress management.

ABSTRACT

This venture investigates the integration of decentralized conglomeration procedures into unified learning systems, pointing to improve security conservation and demonstrate precision. Leveraging differential protection instruments, information conglomeration over conveyed hubs guarantees strong assurance of delicate data whereas empowering collaborative show preparing. By decentralizing the conglomeration handle, this approach mitigates security dangers related with centralized information storehouses. Through reenactments and observational assessments, we illustrate the viability of our proposed strategy in keeping up security ensures whereas accomplishing competitive show execution. Our discoveries emphasize the importance of decentralized conglomeration in combined learning, advertising a promising road for privacy-preserving machine learning in dispersed situations.

KEYWORDS

Decentralized conglomeration, Combined Learning, Information Protection, Demonstrate Precision, Privacy-Preserving Machine Learning.

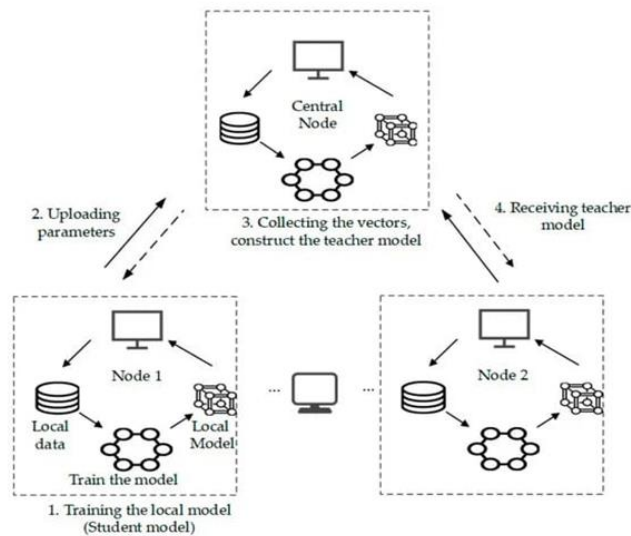

INTRODUCTION

In later a long time, combined learning has developed as a promising worldview for preparing machine learning models over decentralized gadgets, such as portable phones, IoT gadgets, and edge servers, without compromising information security. In any case, conventional unified learning approaches confront challenges in guaranteeing strength, adaptability, and protection security, especially when managing with touchy information. To address these challenges, this extend proposes a novel system that leverages decentralized conglomeration methods combined with differential protection instruments. Decentralized accumulation conveys the accumulation prepare over taking an interest gadgets or servers, diminishing the reliance on a central aggregator and subsequently improving versatility and vigor. By utilizing differential security, which includes clamor to the amassed overhauls to cover person commitments, the system guarantees that delicate data remains secured whereas still permitting for viable show preparing. This venture points to explore the adequacy of combining decentralized accumulation with differential protection within the setting of combined learning. By conveying the accumulation prepare and joining privacy-preserving components, the proposed system endeavors to attain moved forward demonstrate execution, adaptability, and protection ensures compared to conventional combined learning approaches. Through comprehensive experimentation and investigation, this venture looks for to assess the execution and security properties of the proposed system over different datasets and arrange arrangements. Moreover, the extend points to supply experiences into the trade-offs between demonstrate exactness, communication overhead, and security conservation in unified learning frameworks.

LITERATURE REVIEW

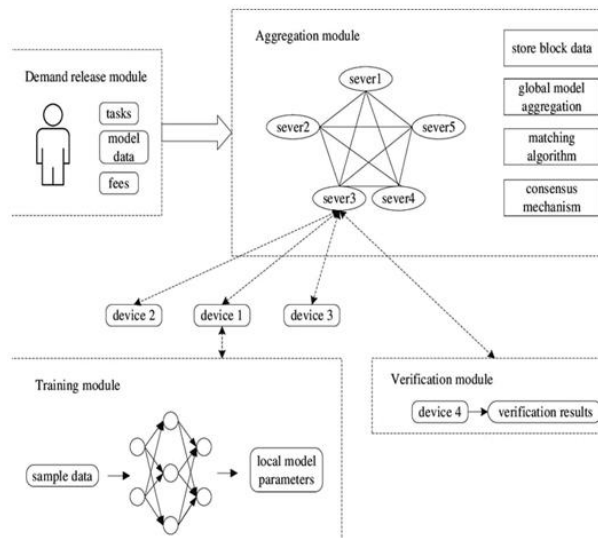

Combined learning has earned noteworthy consideration due to its potential for preparing machine learning models over disseminated gadgets whereas protecting information protection. A few thinks about have investigated distinctive strategies to upgrade unified learning, counting centralized conglomeration, but these approaches frequently endure from adaptability and protection concerns. Decentralized conglomeration strategies have developed as a promising arrangement to moderate these issues by conveying the conglomeration handle among partaking gadgets or servers. Different investigate works have explored the benefits and challenges of decentralized conglomeration in combined learning frameworks.

Also, joining differential security procedures into combined learning systems has become progressively well known to upgrade security ensures whereas keeping up show precision. Later writing has investigated the integration of decentralized aggregation with differential security instruments to attain superior privacy preserving combined learning. These thinks about have appeared promising comes about in terms of adjusting demonstrate execution and security in decentralized situations. In any case, there stay challenges with respect to the optimization of communication overhead, convergence speed, and protection budget assignment in such frameworks. Generally, the writing recommends that combining decentralized accumulation with differential protection holds incredible potential for progressing unified learning by tending to versatility, vigor, and protection concerns. In any case, encourage inquire about is required to optimize these methods and get it their suggestions over distinctive application spaces and organize settings.

EXISTING SYSTEM

The current combined learning frameworks regularly depend on centralized conglomeration strategies that posture versatility and security challenges due to the centralization of delicate information. These frameworks frequently endure from communication bottlenecks and protection dangers related with information conglomeration at a central server. Whereas a few approaches consolidate differential protection instruments to improve security, they may still confront versatility restrictions and execution issues. By and large, existing combined learning frameworks need proficient decentralized conglomeration procedures combined with vigorous differential protection components to address adaptability and privacy concerns successfully. There's a require for a comprehensive system that coordinating decentralized accumulation with differential privacy whereas tending to these existing limitations to encourage versatile, privacy-preserving, and vigorous unified learning.

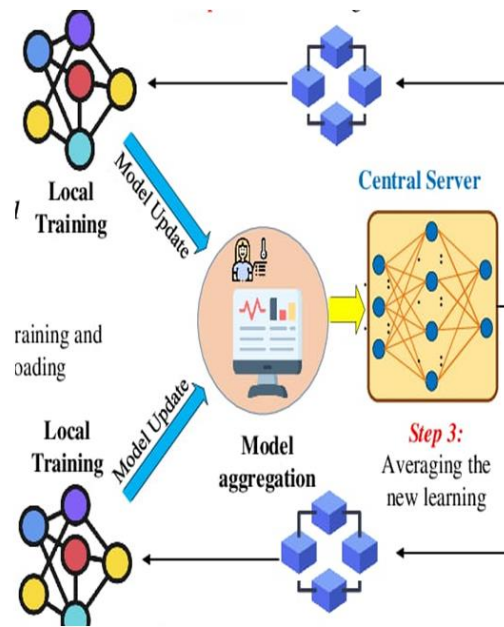

PROPOSED SYSTEM

The proposed upgraded system utilizes decentralized accumulation for unified learning with a center on actualizing differential protection measures. In this system, rather than centralizing information on a single server, different hubs or gadgets collaboratively prepare a show whereas keeping information localized. Each hub computes demonstrate overhauls locally on its information, at that point safely totals these upgrades utilizing decentralized strategies, protecting protection. Differential security instruments are coordinates to guarantee person information security by including clamor to angles or parameters some time recently accumulation, avoiding the extraction of delicate data from individual commitments. This approach advances adaptability because it conveys computation and decreases communication overhead Also, it upgrades protection assurance as information remains on users' gadgets, minimizing the chance of information breaches or unauthorized get to. By leveraging decentralized conglomeration and differential protection, the proposed framework strikes a adjust between collaboration and protection, making it reasonable for scenarios where information protection is foremost, such as healthcare or fund, whereas empowering productive show preparing over disseminated situations.

METHODOLOGY

The project will employ decentralized aggregation for federated learning with differential privacy, combining two key methodologies for privacy-preserving machine learning. Decentralized aggregation distributes the model training process across multiple devices or nodes, reducing the risk of data exposure by keeping raw data locally. This approach promotes scalability and efficiency by allowing local updates before aggregating them into a global model. Federated learning extends this concept by enabling model training on decentralized data sources while preserving data privacy. By incorporating differential privacy, the project ensures that individual data contributions remain confidential by adding noise to the model updates, thus preventing adversaries from extracting sensitive information. This methodology prioritizes both data security and model accuracy, fostering collaboration without compromising privacy. Through decentralized aggregation and federated learning with differential privacy, the project aims to create a robust and privacy-preserving framework for collaborative machine learning across distributed environments.

MODULES

Data Partitioning Module: This module focuses on partitioning the data across decentralized nodes while ensuring privacy-preserving techniques such as differential privacy are applied. It involves dividing the data into subsets and distributing them across participating devices or servers.

Federated Learning Algorithm Module: This module implements the federated learning algorithm, which orchestrates the model training process across the decentralized nodes. It includes procedures for model initialization, parameter updates, and aggregation of model updates while considering privacy constraints.

Differential Privacy Module: This module integrates techniques for preserving privacy, such as differential privacy, into the federated learning process. It involves adding noise to the gradients or model updates before aggregation to prevent the exposure of sensitive information.

Decentralized Aggregation Module: This module handles the aggregation of model updates from multiple decentralized nodes. It ensures that the aggregation process is performed securely and efficiently while maintaining differential privacy guarantees.

Evaluation and Testing Module: This module focuses on evaluating the performance and privacy guarantees of the decentralized federated learning system. It includes metrics for assessing model accuracy, convergence speed, and privacy preservation, along with testing procedures on various datasets and scenarios.

FUTURE ENHANCEMENT

Integration of more advanced encryption techniques to ensure enhanced privacy and security of data during aggregation . Implementation of dynamic learning rate scheduling for optimize model convergence and performance across decentralized nodes. Exploration of more efficient communication protocols for to reduce overhead and latency during aggregation. Development of robust mechanisms for handling node dropouts and failures to ensure continuance in the learning process. Adoption of adaptive differential privacy mechanisms for to dynamically adjust privacy budgets based on data sensitivity and model requirements. Incorporation of reinforcement learning techniques to enable nodes to autonomously adapt their learning strategies based on local data characteristics. Research into novel methods for decentralized model compression for reduce the communication overhead during aggregation. Investigation of hybrid approaches combining federated learning with centralized techniques for improved model accuracy and convergence speed. Deployment of decentralized secure multi-party computation protocols for to enable collaborative model training without exposing sensitive data. Integration of block chain technology for transparent and auditable tracking of model updates, and data contributions. Exploration of decentralized model personalization techniques for to tailor models to individual users while preserving privacy. Implementation of differential privacy-aware model selection strategies to ensure fairness and prevent model's biases. Research into decentralized federated learning frameworks optimized for edge devices with limited computational resources. Development of privacy-preserving techniques for federated transfer learning for to enable knowledge transfer across decentralized nodes securely. Collaboration with domain

experts and stakeholders to ensure ethical considerations are addressed throughout the development process.

CONCLUSION

Decentralized aggregation presents a promising approach for federated learning with differential privacy. By distributing computation and data across multiple devices, it mitigates privacy risks while maintaining model's accuracy. The implementation of differential privacy ensures individual data privacy by adding some noise to the aggregated results. This combination empowers organizations to collaborate more on machine learning tasks without compromising sensitive data. However, challenges such as communication overhead and coordination complexity must be addressed for widespread adoption. Overall, decentralized aggregation fosters a balance between privacy and utility, paving the way for more secure and efficient federated learning

ABSTRACT

In order to keep the body in balance, the liver is essential. As a metabolic powerhouse, it aids in digestion, detoxification, and the regulation of numerous biochemical processes. But the liver can get sick from anything from viral infections to long-term illnesses, and each of these ailments presents a unique risk to human health. Liver disorders are a major worldwide health burden that necessitates prompt and precise diagnostic services. The chance of survival for liver illness might be increased with early detection and treatment. When diagnosing a hepatic patient, machine learning (ML) is a potent instrument that can help medical practitioners. The techniques of feature extraction, classification, and data pre-processing are all included in the typical ML system. Machine learning researchers commonly employ projection-based feature extraction techniques to eliminate data redundancy during the feature extraction step; nevertheless, this does not yield the intended outcomes. Furthermore, while projecting original features, most statistical projection techniques serve distinct objectives. This work presents a novel method for predicting liver illness using deep learning algorithms to analyze medical photos. This research focuses on the extraction of significant characteristics from CT scan images to improve diagnostic accuracy by utilizing the capabilities of Region based convolutional neural networks (R-CNNs).

KEYWORDS

Medical images, Liver disease, Features extraction, Machine learning, Deep learning

INTRODUCTION

The liver is responsible for all metabolic processes which store chemicals and deliver them to cells as needed. It also transforms nutrients from the diet into substances that the body can use. Moreover, it is in charge of transforming harmful compounds into safe ones. The liver also produces bile, and proteins, stores and releases glucose, processes haemoglobin, cleans blood, produces immunological factors, and removes bilirubin, among other essential processes. It is therefore the main and most important organ in the body, and maintaining its health is vital to bettering general health. However, the truth is that when it comes to health, individuals tend to ignore it. The majority of people on the planet have acute to severe liver disorders as a result of bad lifestyle choices. Early identification and treatment of liver problems can help prevent liver failure. Liver disease progresses in four stages, the first of which is characterized by inflammation and may or may not cause symptoms in the patient. Extended inflammation results in the replacement of good liver tissue by scar tissue, leading to the onset of the second stage of the disease, known as fibrosis, which is also largely silent. The third stage is cirrhosis, which is brought on by severe liver scarring. At this point, the patient begins to exhibit symptoms such as weakness, exhaustion, nausea, and jaundice. Liver disease affects millions of people worldwide, posing a serious health threat. Improved patient outcomes and a lighter load on the healthcare system can result from early identification and precise classification of liver illnesses. Fatty liver disease is a common condition in wealthy countries, affecting one-third of adults and a rising percentage of children. The initial symptom of the illness is an abnormal accumulation of triglycerides in the liver, which can develop into cirrhosis and liver cancer in certain individuals by inciting an inflammatory response. The

segmentation facilitates the precise extraction of pertinent features, encompassing characteristics like shape, texture, and spatial relationships. Such features, extracted from segmented liver and tumor regions, serve as vital discriminative cues for subsequent classification tasks. While there is a notable connection between obesity, insulin resistance, and fatty liver disease, they are distinct factors that often coexist or influence each other. The pathophysiology of NAFLD is still not well understood, and there are few treatment options available. Based on patient data, machine learning approaches have nevertheless shown promising results in the prediction and classification of liver disorders. These methods predict results and find patterns in massive datasets by using complex algorithms to examine and learn from them. To increase accuracy and reduce medical costs, research on the use of machine learning techniques for liver disease classification and prediction is continuously changing. Figure 1 illustrates the different stages of liver disease.

Fig 1: Stages of liver disease

RELATED WORK

Machine learning models such as Logistic Regression, Decision Tree, K-Nearest Neighbours algorithm, Random Forest, Gradient Boosting, and XGBoosting have all been used by Ketan Gupta. To forecast hepatic illness in individuals. The study addresses concerns that were overlooked by previous researchers, leading to an enhancement in the accuracy of predictions. Classification techniques are utilized in various automatic medical diagnostic methods. Detecting liver disease symptoms

early is challenging since the organ functions correctly despite partial damage. Early diagnosis of liver issues increases the survival rate of patients. Detecting the presence of certain enzymes in the blood can be utilized to identify liver disease. The study uses a dataset of liver patients to predict whether or not they have liver disease. The Random Forest, Light GB and AdaBoost algorithms were found to offer accuracy and classification techniques once the findings were analysed. It has been determined that the Light GBM algorithm proves to be the most suitable for predicting liver disease. Nibin Mathew has proposed that early detection of diseases like hepatocellular carcinoma (HCC) demands novel methods to ascertain the disease phase. Individuals diagnosed with HCC undergo organized interactions to comprehend the impact of both conventional and investigational drugs. This systematic approach aids in predicting the outcomes of HCC and choosing the most effective treatment strategies. Extensive data, sourced from databases like data warehouses, external repositories, and the World Wide Web, is meticulously stored for comprehensive analysis. Data mining is a technique used to analyze this data and discover interesting patterns. The goal of data mining is to identify conventional and investigational drugs. This systematic approach aids in predicting the outcomes of HCC and choosing the most effective treatment strategies. Extensive data, sourced from databases like data warehouses, external repositories, and the World Wide Web, is meticulously stored for comprehensive analysis. Data mining is a technique used to analyze this data and discover interesting patterns. The goal of data mining is to identify hidden patterns to reduce complexity and save time. AI algorithms can be used for knowledge discovery from databases. Alawneh proposes that depending on the nature of the dataset, different techniques such as classification, clustering, regression algorithms, neural networks, and genetic algorithms can be applied. Specifically, computer-aided diagnosis systems utilizing various medical imaging techniques have the potential to contribute to the early detection of liver cancer. The Deep learning algorithm is used to identify liver cancer. Classification performance

is greatly enhanced when automatic feature extraction using Region based Convolutional Neural Networks (R-CNN) is combined with the Support Vector Machine (SVM) classifier. According to the research, using the hybrid model that has been recommended can result in a considerable reduction in processing time when compared to the ResNet50 model. Accuracy, specificity, precision, and sensitivity were all 100% of the performance metrics. Across all quantitative evaluations, the suggested method shows precise and efficient tumour identification, even in low-contrast CT scans. However, CAD systems must rely on small private datasets from hospitals and scanning facilities because to the lack of huge publicly accessible datasets. Therefore, more datasets are required for classification and research purposes. In the future, this study may be expanded to make use of a large clinical dataset and enhance image visualisation by the application of image processing techniques. A strong and dependable system might be created and put into use in clinical settings with the help of an extensive dataset. Zeynep Kucukakcali analysed A collection of techniques called data mining is used to find hidden patterns in databases. Utilising computer programmes to identify significant patterns and correlations within massive data sets is known as data mining. We can make predictions by doing this. According to the definition, the main objective of data mining is to extract valuable information from a large portion of the data that is still in the data warehouse. In the data mining branch of machine learning, algorithms are created to produce predictions based on data. It is possible to predict the outcomes of the previously unlearned inputs using the input and output sets provided by machine learning. An increasing number of people are dying from liver cancer, which is a major cause of cancer deaths. Aflatoxin B1 or other mycotoxins, obesity, cirrhosis, chronic hepatitis B and C infection, non-alcoholic steatohepatitis (NASH), and alcohol usage are among the risk factors for liver cancer, which has a bad prognosis. Due to liver cancer's dismal prognosis, medical professionals and researchers are searching for novel treatment approaches that will extend patients'

lives. A group of researchers led by Girma Biniam Solomon proposed a system that helps in classifying tumours, a crucial step in detecting liver cancer through computer-aided and automated diagnosis. This system reduces the false positive rate and unnecessary healthcare costs. Different classifiers have been used in the context of medical imaging applications to detect liver cancer from CT scans. The suggested technique, on the other hand, uses an artificial neural network (ANN) with three layers to classify tumours in a different way. Three criteria were used to evaluate the ANN's performance: sensitivity, specificity, and accuracy. Twenty-four photos total – 12 benign and 12 malignant tumours – were examined. A skilled radiologist carefully examined the suggested framework, from the first improvement to the last categorization stages. Nine texture features were utilised by the system to retrieve pertinent texture information after the liver was segmented from the abdominal CT picture. The two steps of the texture analysis procedure were texture quantification and picture filtration. Opting for frequency domain filtering was discovered to be more effective because the spatial convolution of the filter mask and the picture is equal to the frequency domain multiplication of the filter mask and image's Fourier transforms. The mean, variance, standard deviation, range, contrast, energy, homogeneity, correlation, and entropy were the nine quantifiable texture features

EXISTING METHODOLOGIES

Combining the Watershed Transform with the Gaussian Mixture Model (WT-GMM) provides a complete approach in image processing and computer vision. The Watershed Transform is a useful tool for precisely identifying regions since it can split images based on intensity gradients, much like topographic features in a landscape. Nevertheless, in complicated circumstances, its vulnerability to over-segmentation needs supplementary solutions. The Gaussian Mixture Model intervenes in this situation by using probabilistic modeling to group pixels according to intensity distributions, which refines the segmentation procedure. The process usually starts with some preprocessing and ends with main segmentation using the

Watershed Transform. A region merging phase might then be added to address the issues with over-segmentation. Subsequently, the Gaussian Mixture Model improves the accuracy and flexibility of the segmentation process by allocating pixels to clusters according to their intensity values. WT-GMM, an integrated strategy, leverages the advantages of both methods to provide a strong solution for image segmentation jobs when conventional methods might not be sufficient.

The Hybrid Feature Selection (HFS) method combines the advantages of neural networks and cross-validation. It was developed for the analysis of liver cancer using microarray data. By utilizing neural networks' ability to interpret complex patterns found in high-dimensional microarray datasets, the HFS method uses these networks to identify and rank the most important features—genes, for example—that enhance the discriminative power of the model. The neural network dynamically modifies feature weights during training to highlight the genes that are essential for precise predictive modeling. To guarantee the resilience and applicability of the chosen characteristics, cross-validation is incorporated into the process involves systematically dividing the dataset into training and testing subsets to repeatedly assess the effectiveness of the model. The combination of neural network-based feature selection and cross-validation in the HFS technique provides a holistic strategy for discovering important genetic markers linked to liver cancer, enabling more precise and dependable microarray analytic classification models.

PROPOSED METHODOLOGIES

Deep learning techniques, involve leveraging the capability of neural networks to analyze intricate patterns across diverse datasets. have become effective instruments in the field of liver disease prediction. Well-known for their efficiency in image-based activities, Region based convolutional neural networks (R-CNNs) are beneficial when analysing medical imaging data related to liver illnesses. These networks can identify tiny anomalies in CT, MRI, and ultrasound images linked to liver problems

because they can independently learn hierarchical structures. The process of the proposed work can be defined as follows

Preprocessing: In this module, we can resize the image and remove the noise in the image using the Median filtering algorithm. A filter serves the purpose of removing noise that may have affected an image. This is accomplished by employing a statistical approach, and filters are usually designed to attain a specific frequency response. In image processing, nonlinear filtering is frequently utilized to decrease "salt and pepper" noise. When the objective is to minimize noise while preserving edges, a median filter is more effective than convolution. In image preprocessing, the median filtering algorithm is used to apply the filter. To begin, essential libraries such as OpenCV and NumPy are imported, and the target image is loaded. Optional grayscale conversion can be done to simplify subsequent processing steps. The core of the preprocessing involves using the `cv2.medianBlur ()` function to apply the median filtering technique. Selecting an odd kernel size is crucial because it affects how noise reduction and image smoothness are traded off. In addition, image binarization is also carried out during the preprocessing stage. This process is carried out as part of document analysis, to separate the foreground text from the background of the document.

Having a rapid and precise technique for binarizing document images is essential for subsequent document image processing tasks.

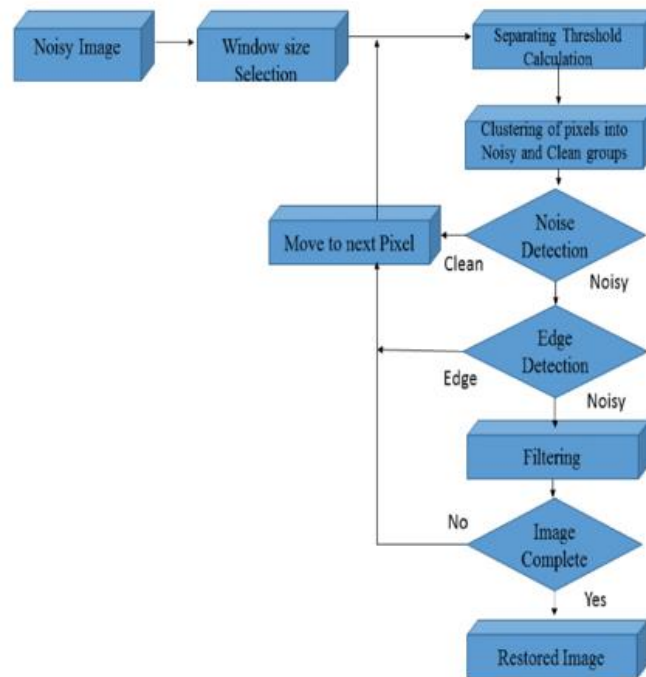

Fig 2: Noise filtering steps

Here's a clearer version of the text you provided:

ALGORITHM FOR MEDIAN FILTERING

INPUT: Given an image X with dimensions $M \times N$ and a filter size represented by the variable ' n ,' we have an input setup for further processing.

OUTPUT: An image Y of the same size as X .

To begin:

Start by creating a histogram, and let's call it H .

For each of the pixels in the image X :

For each of the neighbouring pixels in a square of size n cantered on the current pixel:

Remove the pixel that's $n/2$ rows above and to the left of the current pixel from the histogram H .

Add the pixel that's $n/2$ rows below and to the right of the current pixel to the histogram H .

The set of values of the pixel in output image Y to the median value of a pixel in histogram H .

That's it! This algorithm applies a median filter to the input image X to create the output image Y .

Model construction and prediction

Convolutional neural networks are feed-forward networks that can identify topological features in the input image. A classifier then uses the features that were retrieved to classify the raw image. R-CNNs exhibit invariance to basic geometric changes like as rotation, scaling, translation, and squeezing. The R-CNN algorithm has been successful in improving patient outcomes by helping to identify liver diseases. It achieves this by identifying complex visual patterns that are difficult to discern using traditional diagnostic methods. The integration of R-CNNs in liver disease prediction not only enhances the accuracy of identification but also streamlines the diagnostic process, reducing reliance on manual interpretation. Each connection is given a trainable weight; however, the weights of all units inside a feature map are shared. The weight-sharing technique is a feature that is implemented in every R-CNN layer and provides for a reduction in the number of trainable parameters. Neurons are capable of extracting basic visual elements, such as edges, from local receptive fields. Neural structures with the same weights shared by neurons at multiple sites can be used to extract the same visual characteristics. A feature map is the result of this kind of neural network. This process is equivalent to convolution. In the input image using a tiny kernel. You can employ multiple feature maps to capture various visual features decreasing the resolution of the feature map by subsampling reduces the sensitivity of the output to shifts and distortions. From each original eye data set, many features can be retrieved using our suggested R-CNN structure, and each feature has n^3 dimensions.

Thirteen convolutional layers make up the model, which is intended to extract features from input photos. Max-pooling layers, which down-sample the feature

maps to obtain hierarchical information, come after these layers. Furthermore, three completely connected layers are in charge of determining the input image's class in the end. Limited 3x3 5x5, or 7x7 pixels convolutional filters are used by the architecture to capture minute features in images with limited receptive fields.

By stacking convolutional and pooling layers, the model can learn features at different scales. Its pretraining on ImageNet contributes to a broad understanding of visual concepts, making it suitable for transfer learning. Transfer learning allows the model to be adjusted for a particular job, like liver disease detection, by swapping out the final few layers while keeping the weights of the pre-trained layers. The model's depth enables it to learn intricate features and patterns from images, making it capable but also increasing computational complexity. These models evaluate changes in tumor size, shape, and metabolic activity over time by assessing sequential imaging scans; this allows them to provide valuable information about treatment efficacy and helps guide therapeutic decision-making.

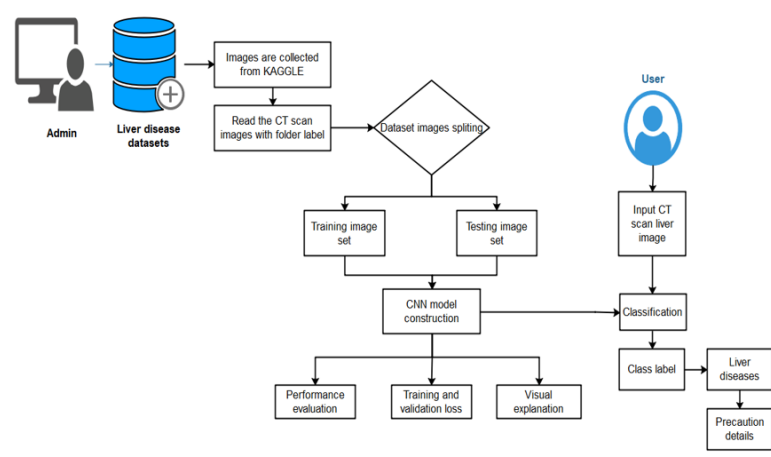

Fig 3: Proposed Work

RESULTS AND DISCUSSION

In the simulation, deep learning-based techniques perform better than conventional approaches like region-growing algorithms or thresholding, especially in difficult cases with complicated anatomical components or diverse liver tissues appearances. When compared to manually created feature-based methods, deep

learning techniques can discover discriminative features straight from the data, producing segmentation results that are more reliable and accurate. we can gather datasets from KAGGLE and use CT scan images. We extract important characteristics from the datasets and employ them to assess how well the proposed method works. The system's performance is evaluated using F-measure, recall, and precision.

$$\text{Precision} = \text{TP} / (\text{TP} + \text{FP})$$

$$\text{Recall} = \text{TP} / \text{TP} + \text{FN}$$

$$\text{F Measure} = 2 * \text{Precision Recall} / \text{Precision Recall}$$

indicate a decrease in prediction correctness.

$$\text{ACC} = (\text{TP} + \text{TN} / \text{TP} + \text{TN} + \text{FN} + \text{FP}) * 100$$

Figure 4 indicates that CNN-based models have higher accuracy than image segmentation methods for machine learning and deep learning

Fig 4: Confusion matrix

CONCLUSION

In summary, utilizing Region based Convolutional Neural Networks (R-CNNs) for predicting liver diseases marks a significant breakthrough in the field of medical diagnostics. This application represents a revolutionary development that could improve the precision and efficacy of liver disease detection. The intrinsic ability of

R-CNNs to automatically learn hierarchical features from medical imaging data has significantly elevated our capacity to detect subtle patterns indicative of liver diseases in modalities such as CT scans. This automated and data-driven approach holds immense promise for early and accurate diagnosis, facilitating timely interventions and improving patient outcomes. The R-CNN algorithm's success lies in its capacity to discern complex visual patterns, providing an interface for understanding liver pathology that transcends traditional diagnostic methods. The integration of R-CNNs in liver disease prediction not only enhances the accuracy of identification but also streamlines the diagnostic process, reducing reliance on manual interpretation.

ABSTRACT

Quantum computing, propelled by the principles of quantum mechanics, stands poised to redefine the landscape of computational power, offering transformative potential across diverse fields, which promises to overcome the drawbacks of conventional CMOS(Complementary Metal-Oxide Semiconductor) technology for high density and high performance. This paper embarks on a comprehensive journey through the realm of quantum computing, elucidating its foundational principles, recent advancements, and prospective applications. Commencing with an exposition of quantum mechanics bedrock concepts – superposition, entanglement, and quantum gates – we lay the groundwork for understanding quantum computing's unique paradigm. Building upon this framework, we traverse the architecture of quantum computers, spotlighting pivotal components like qubits, quantum circuits, and cutting-edge quantum algorithms. Moreover, we conduct a thorough examination of the current state of quantum computing research and development, spotlighting breakthroughs in qubit coherence, error mitigation strategies, and scalable architectures. Amidst these triumphs, in the latter part of our discourse, we navigate through the burgeoning landscape of quantum computing applications, spanning optimization dilemmas, machine learning paradigms, cryptographic endeavours, and materials science frontiers. Through this exploration, quantum computing emerges as a potent tool poised to unlock novel solutions to previously insurmountable challenges. In this quantum computing we can able to do the complex problem solving because qubits can exists infinite number of states. This

paper underscores the transformative potential of quantum computing, underlining the imperative for sustained research and collaborative efforts to harness its prowess for societal advancement. By shedding light on both theoretical underpinnings and pragmatic applications, we endeavor to ignite further curiosity, exploration, and innovation in this dynamic arena.

INTRODUCTION

A quantum computer is a machine that performs calculations based on the laws of quantum mechanics, which is the behavior of particles at the sub-atomic level. Quantum computing has the potential to revolutionize cryptography by breaking traditional encryption methods. However, it also offers the ability to create unbreakable quantum encryption protocols, ensuring secure communication. Quantum information theory is a branch of theoretical physics and computer science that deals with the implications of quantum mechanics on the processing and communication of information. In the context of cybersecurity, quantum information theory introduces both opportunities and challenges. Quantum computing is a field that utilizes the principles of quantum physics to build powerful computers. Unlike traditional computers, which use bits to represent information as either 0 or 1, quantum computers use qubits that can exist in multiple states simultaneously. This allows for parallel processing and enables quantum computers to perform complex calculations more efficiently than classical computers. Quantum computing has the potential to revolutionize various industries, including cryptography, optimization, drug discovery, and machine learning. It could solve complex problems that are currently intractable, leading to advancements in science, technology, and innovation. However, there are still many challenges to overcome, such as the need for stable qubits and error correction techniques.

History of Quantum Computing:

The history of quantum computing is a fascinating journey marked by groundbreaking discoveries, theoretical breakthroughs, and technological advancements. Here's a brief overview:

Origins in Quantum Mechanics (Early 20th Century):

Quantum mechanics, developed in the early 20th century, laid the theoretical groundwork for quantum computing. Pioneering physicists like Max Planck, Albert Einstein, Niels Bohr, Werner Heisenberg, and Erwin Schrödinger established the principles governing the behavior of particles at the quantum level.

Quantum Theory and Computing Concepts(1970s):

In the 1970s, researchers such as Yuri Manin, Richard Feynman, and others began exploring the idea of using quantum mechanics to perform computations. Feynman, in particular, suggested that classical computers might struggle to simulate quantum systems efficiently.

Deutsch's Algorithm (1985):

David Deutsch formulated the concept of a quantum Turing machine and proposed the first quantum algorithm, known as Deutsch's algorithm. This algorithm showcased the potential of quantum computers to solve certain problems exponentially faster than classical computers.

Shor's Algorithm (1994):

Peter Shor developed an algorithm that could efficiently factor large numbers, a problem considered hard for classical computers. Shor's algorithm demonstrated that quantum computers could theoretically break RSA encryption, a foundation of modern cybersecurity.

Experimental Progress (1990s-2000s):

Experimental efforts to build quantum computers gained momentum in the 1990s and 2000s. Several approaches, including trapped ions, superconducting qubits, and quantum dots, were explored by research groups and tech companies.

D-Wave Systems (2007):

D-Wave Systems introduced its quantum annealing machines, which use a different approach from universal quantum computers. While controversial in terms of its quantum advantage, D-Wave's systems represented a significant step forward in practical quantum computing.

Advances in Quantum Error Correction (2009-2010s):

Quantum error correction became a crucial area of research to mitigate errors in quantum computation caused by noise and decoherence. Various codes and techniques were developed to address this challenge.

Quantum computing continues to advance rapidly, with major tech companies, startups, and research institutions investing in both hardware and software development. Challenges such as improving qubit coherence, scalability, and error correction remain key areas of focus.

Principles of Quantum Computing:

Quantum computing operates on fundamentally different principles from classical computing. Here are the key principles underlying quantum computing:

Superposition:

In classical computing, a bit is in a state of either 0 or 1. In quantum computing, quantum bits or qubits can exist in a superposition of both states simultaneously. This means that a qubit can represent both 0 and 1 at the same time, enabling quantum computers to perform many calculations in parallel.

In simple words, superposition is the ability of quantum system to be in multiple states at the same time until it is measured.

Entanglement:

Entanglement is a phenomenon where the quantum states of two or more particles become correlated in such a way that the states of one particle instantly influences the states of the other, regardless of the distance between

[In quantum computing, entanglement allows qubits to be interconnected in a way that the state of one qubit depends on the state of another, leading to powerful computational effects]7.

Quantum Gates:

Quantum gates are similar to classical gates, but do not have a degenerate output. i.e. their original input state can be derived from their output

state,uniquely.They must be reversible. This means that a deterministic computation can be performed on a quantum computer only if it is reversible.

Hadamard Gate

Simplest gate involves one qubit and is called a Hadamard Gate (also known as a square-root of NOT gate.) Used to put qubits into superposition.

Note: Two Hadamard gates used in succession can be used as a NOT gate

Controlled Not Gate : A gate which operates on two qubits is called a Controlled- NOT (CN) Gate. If the bit on the control line is 1, invert the bit on the target line.

A	B	A'	B'
0	0	0	0
0	1	1	1
1	0	1	0
1	1	0	1

Note: The CN gate has a similar behavior to the XOR gate with some extra information to make it reversible.

Controlled Controlled NOT(CCN)

A gate which operates on three qubits is called a Controlled Controlled NOT (CCN) Gate. Iff the bits on both of the control lines is 1, then the target bit is inverted.

Input			Output		
A	B	C	A'	B'	C'
0	0	0	0	0	0
0	0	1	0	0	1
0	1	0	0	1	0
0	1	1	1	1	1
1	0	0	1	0	0
1	0	1	1	0	1
1	1	0	1	1	0
1	1	1	0	1	1

Algorithms in Quantum Computing:

Shor's Algorithm:

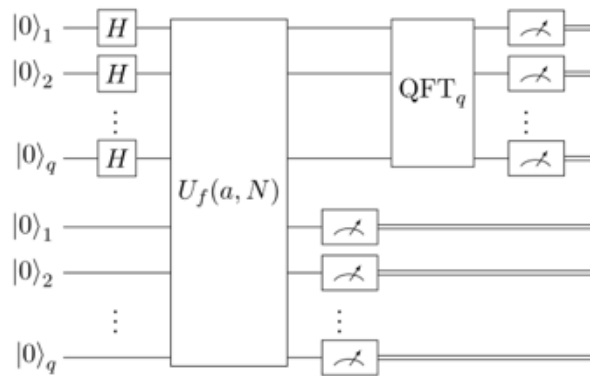

Shor's algorithm shows (in principle,) that a quantum computer is capable of factoring very large numbers in polynomial time.

The algorithm is dependant on

Modular Arithmetic

Quantum Parallelism

Quantum Fourier Transform

We use the Shor's algorithm to finding large prime numbers is thus very useful in order to decrypt messages. Shor's algorithm uses quantum mechanics to find such prime numbers, and thus break RSA encryption much faster and more efficiently than in the classical case.

[It is designed to efficiently factorize large composite numbers. It's one of the most famous and impactful algorithms in quantum computing, as it provides an exponential speedup over the best-known classical algorithms for factoring]11.

Grover Algorithm:

[Grover's algorithm is a quantum algorithm for searching an unsorted database with N entries in $O(N^{1/2})$ time and using $O(\log N)$ storage space (see big O notation).]9

It may be used under four different types of ways:

Put all Qubits in to superposition using a Hadamard gate.

Implement an oracle that will mark the state you wish to find. ...

Implement an amplification circuit that further increases the marked states amplitude while decreasing the amplitude of all other states.

Measure all qubits.

Quantum Information:

Quantum information is the information of the state of a quantum system. It is the basic entity of study in quantum information theory, and can be manipulated using quantum information processing techniques.

Quantum information refers to both the technical definition in terms of Von Neumann entropy and the general computational term.

Its main focus is in extracting information from matter at the microscopic scale.

[Observation in science is one of the most important ways of acquiring information and measurement is required in order to quantify the observation, making this crucial to the scientific method]6. In quantum mechanics, due to the uncertainty principle, non-commuting observables cannot be precisely measured simultaneously, as an eigenstate in one basis is not an eigenstate in the other basis. [According to the eigenstate–eigenvalue link, an observable is well-defined (definite) when the state of the system is an eigenstate of the observable. Since any two non-commuting observables are not simultaneously well-defined, a quantum state can never contain definitive information about both non-commuting observables. Information is something physical that is encoded in the state of a quantum system]4. Quantum information, like classical information, can be processed using digital computers, transmitted from one location to another, manipulated with algorithms, and analyzed with computer science and mathematics. Just like the basic unit of classical information is the bit, quantum information deals with qubits. Quantum information can be measured using Von Neumann entropy.

Recently, the field of quantum computing has become an active research area because of the possibility to disrupt modern computation, communication, and cryptography.

[In quantum information, these different states are represented by quantum bits, or qubits. Entanglement is a powerful resource in quantum information processing. It allows for the creation of quantum communication channels, where information can be securely transmitted between distant parties.]5 It also enables quantum teleportation, a process by which the state of one qubit can be transferred onto another qubit at a different location, without physically transporting the qubits themselves.

Overcoming challenges in creating and maintaining robust qubits and managing errors will be crucial in realizing the full potential of quantum information technologies.

Quantum Cryptography:
